COAL AGE

With Which is Consolidated
The Colliery Engineer

INDEX TO VOLUME XXIV

July 1 to December 31, 1923

Note.—Illustrated articles are denoted by an asterisk (*), book notice by a dagger (†). Titles are often abbreviated. They are indexed under their most important words, or, if no word be distinctive, under the first one (except "A," "The," etc.) or under some topical word not found in the title. (e) denotes editorials.

Following is a list of the pages included in the several numbers of the volume by date:

July	5	1-40
"	12	41-90
"	19	91-126
"	26	127-162
Aug.	2	163-198
"	9	199-234
"	16	235-270
"	23	271-306
"	30	307-344
Sept.	6	345-384
"	13	385-424
"	20	425-466
"	27	467-502
Oct.	4	503-538
"	11	539-578
"	18	579-616
"	25	617-652
Nov.	1	653-688
"	8	689-726
"	15	727-764
"	22	765-800
"	29	801-836
Dec.	6	837-872
"	13	873-908
"	20	909-944
"	27	945-976

A

Abandoned mines, Entering. Discussion..	519
Accidents	
—Causes classified	*667
—Distribution by occupation	*665
—Reducing	743
—Roof-fall	149
Accounting, sales, at mine. McNeil.	*319
Aerial tramway, Traber and Richards.	*175
Africa, production coal	330
Air, compressed, Ventilating by. Discussion.	598
Air dome prevents breaking of column line.	*437
Air, humidification mine.	950
Air, moistening, in intake. Chester.	*663
Air, Resistance to flow (inq.) 561. Discussion	*821
Airways in Mines, Multiplying. Discussion	182
Airways, resistance due to bends (inq.). Holman	111
Alabama	
—Appropriation mining dept.	575
—Coal land leased Gov't.	231, 382
—Production	158
—Railroad from Kimbrough.	941
—Union	162
Alabama Min. Inst.	826
Alaska	
—Coal marketed	88
—Bituminous Coal Co.	195
—Black powder discontinued	335
Allegheny-Pittsburgh Coal Co.—Safety block. Brosky	*78
Alibi, It's a thin (e)	425
Aluminum Ore Co., flooding of Radium mine	*892, 942
America, coal reserves	17
Amer. Federation of Labor—Convention.	607
Amer. Fuel Co.—Strike Beltona mines.	88
Amer. Inst. Chemical Engrs.	642
Amer. Inst. Elec. Engrs.	
—Lehigh Valley section, meeting.	856
—Meeting, annual	76
Amer. Inst. Min. & Metall. Engrs.	
—Officers nominated	824
—Papers	*433
—Washington section	962
Amer. Min. Congress	
—Addresses	481, 627, *885
—Blasting (e)	539
—Exhibits	596, 658
—Future (e)	503
—Meeting	488, *523, *593
—Program	459
—Standardization. 596, 658, 782, 923, (e)	539
Amer. R.R. Assn.	152, 466, 502
Amer. Soc. Mechanical Engrs.	
—Meeting Material Handling Div.	894
—President, F. R. Low	642
Amer. Wholesale Coal Assn.	
—Addresses	108
—Committees	197
—Says Coal Comm. report pyramiding one-sided	456
—Meeting executive committee.	895
Amer. Statistical Assn.	930
Ammonia from coke-oven gas	281
Ammonia, sulphate	173, 309
Amortization, miners' houses.	725
Analyses, coal	97
Analyses, gases	5

Anthracite	Page
—Conference... 83, 115 187, *293, *332, 335, 371, (e)	385
—Control bill, Pinchot.	891
—Dispute (e).	199
—Economy show	907, *960
—Margins shrink	825
—Miners' demands	29
—Penn. production, 1922	81
—Production costs (e)	308
—Profits report Coal Comm.	747
—Regulation, Pinchot conferences.	825, 929
—Report Coal Comm. 43, 116, 151, (e)	82
—Shipments... 123, 304, 500, 650, 798, 943	82
—Shortage, causes	58
—Sizes	678
—Stocks.	*79, *223, *375
—Strike, 371, 373, 374, 415. Agreement.	458
—Substitute	694
—Tax, Penn.	480, 576, 893
Apprentice system in mining.	151
Arbitration (e)	92, 164, 307
Arbitration Society of America.	108
Arbitration work, Would compulsory (e).	765
Arc, calculating	863
Army bids.	30, 157, 195, 297, 464, 497
Arresters, Testing lightning. Goodwin.	*210
Ashes, flushing	769
Ash conveyor. Steam-jet.	*516
Asia, production coal	330
Associated Coal Bureau of Kansas City.	67
Assn. Bituminous Operators Central Pa.	616
Association, electrical engineers, national (e)	579
Assn. Iron & Steel Electrical Engrs.	
—Meeting	604
—Program	446
Associations, trade (e)	164, 766
Auger bit with two reamers.	*213
Australia, production, coal	330
Austria	
—Coal reserves	17
—Production coal and lignite.	330
Axle collar	*437
B	
Bache-Denman Coal Syndicate vs. U. M. W.	675
Bankers' acceptances	752
Barnes, J. H.	334
Bathhouse, Gallup-American Coal Co.	*428
Battery track	*591
Bearing, roller, wheels (Correction).	136
Bearings, How to babbitt motor.	252
Bearings, roller, self-aligning.	245
Bearings, roller vs. plain.	595
Beautify a coal mine? (e)	618
Beaver Valley Coal Co.	798
BELGIUM	
—Deep mining. Discussion.	254
—Production, coal	330
Bells, signaling	*518
Belts	
—Conveyor, rubber	*237
—Drive, laying out	401
—Drive, Lenix	*662
—Keep efficiencies high. Schaphorst.	*859
—Power transmitted by leather.	634
Benzol, Franklin plant.	*309
Bertha-Consumers Co.—First-aid meet.	*304
Betelgeuse drawing night? (e)	579
Bethlehem Mines Corp.—Safety first meet.	343
Bethlehem Steel, first-aid meet.	592
Bids	
—Army.	30, 124, 157, 195, 297, 464, 497
—Gov't, fuel yards.	643
—Navy	716, 763
—New York	123
—U. S. Shipping Board.	569, 676, 857
Bit with two reamers, auger	*213
Bitner mine fire, Carbon dioxide fights.	*3, 132
Jones	
Bituminous	
—Coal Comm. report labor.	*601
—Loadings, Lake Erie ports.	121, 296, 640, 850, 914
—Mine law (Pa.) ventilation. Discussion.	290
—Mines classified	506
—Mines, effect irregular operation.	*444
—Operators offer supply nation's fuel.	189
—Operators' Special Comm.	188, 490, 603, 643
—Producers' classified	885
—Stocks.	*79, *223, *375
—Strike forecast	488 (e) 385
Blackdamp. See "Mine Gases"	
Blackhawk Coal Co., explosion.	891
Blacksmith hammer	*706
Blacksmith shop, Gallup-American.	*427
Blanket, rubber	592
BLASTING. See also "Explosives."	
—Container for caps.	*944
—Dangers in electrical blasting.	861
—Dewatering wet hole.	743
—Exam. questions	366, 406, 712, 786
—Explosives Permissible. Discussion.	290
—Shooting to obtain lump coal.	593
—Shots well placed in upraise save timber.	
Powell	*358

Blizzard trial... 189, 342, 384, 799, 835, 943	Page
Block, safety, for mine cars.	*78
Bloomfield's Labor Digest	128
Boiler, banking fire under	966
Boiler room, Lynch.	*553
Boiler practice, Advance in steam. Price.	*767
Boilers, pulverized fuel for.	315
Boilers, water supply, Navajo mine.	390
Bolt, M.	834
Bonding. See also "Electricity."	
Bonding, efficient method of cross.	*782
Bonding, importance of	966
Bone vs. coal, utilizing	238
Bookkeeping, Machine, at mine. McNeil.	*319
Book reviews	432, 856
Boom, Knox Gon-Box Loading.	*174
Brain and brawn (e)	164
Branch Coal & Coke Co. Locomotive taken up mountainside	*105
Brass, drilling. Radebaugh.	*669
Brazing, Welding and. Radebaugh.	*99
Breaker, fire protection. Hammond.	*729
Brennan, W.	*115
Brevity (e)	92
Brick, Carbofrax	338
Bright, G.	*422
Briquetting binder, seaweed for.	782
Briquetting froth floated coal. Tupholme.	277
Briquetting lignite, Brenfuit, Sask.	501
Briquets, Indo-China	*208
Briquets, Russia	*512

Beard	

	Page		Page		Page
Examinations, Retrograde mining. Thompson	784	Excess mines (e)	617	Frog, cast-steel	*17
EXAMINATION QUESTIONS		Exchanges, Wadleigh prepares data on coal	569	Fuel, motor	173
—Ala. firebosses—Volume of air passing per minute; mixed lights in gassy mine; shielded safety lamps; safety lamps in gaseous mine; danger signals in gassy mine; why is marsh gas found near roof and carbon dioxide near floor?	184	Excesses not reasons (e)	580	Fuel oil consumed by public utilities	*174
—Anthracite foremen, Districts 1-3.—Mixture and explosive mixture; Avondale disaster; three natural causes governing flow of air in mine; effect regulator on mine resistance; separate traveling-way; air measurements; quantity of air in circulation; diffusion of gases; strength of props 746. Requirements of law in blasting; thickness of pillars; strain on rope; finding depth of shaft; pressure top of dam; reducing accidents.	786	EXPLOSION. See also "Dust." "Gases Mine." "Ventilation."		Fullo pump	315
—Anthracite foremen, Districts 3-7.—Safety lamp, testing for firedamp, requirements, oils used adjustment mine doors for ventilation, examining mine; dynamite and its constituents 328. Volume of air in airway; instructions to prevent accidents from blasts; anthracite law requiring foremen to withdraw under his charge; pillar drawing in gaseous mine; minimum quantity of air; anthracite law on examination old and new workings.	366	—Blackhawk Coal Co.	891	Furnace linings	*178
—Anthracite foremen, Dists. 8-14.—Quantity air; permissible explosives; dividing air current; pitch of prop; enlarging shaft; *406. Causes of mine fires and precautions; cubical contents of sinking bucket; first aid; sinking double-track slope	442	—Causes, primary and secondary	934	Fuse don'ts	*178
—Anthracite foremen, Dists. 15 and 16.—Mine gases; precautions in blasting when driving two breasts toward each other; place for open light in mine; removing firedamp; safety lamps; natural and mechanical ventilation; why is mine ventilation necessary?	823	—mining the remedy. Atkins	672	Fuses and fuse block	*174
—Bituminous, Pa., foremen and firebosses.—Duties regarding ventilation; reporting accidents; violation mining laws, disobeying instructions; removal of dangers building stoppings, writing daily report; precautions in non-gaseous mines; lamps where carbon dioxide is generated 256. Causes and prevention accidents; drawing room pillars; safeguarding workman in non-gaseous mine worked with open lights on discovery of explosive gas; causes and prevention of fires in non-gaseous mines; equipment to be installed with electrically driven pumps; capacity of double-acting pump	292	—Gas, preventing, explosions. Edwards	968	Future for too many mines (e)	910
—First-class foremen, Birmingham, Ala.—Material for building airtight or fire-proof stoppings; need of blueprint copy of mine map; water gage reading; percentage of pitch for chutes; area of airway; velocity of air current; water flowing in ditch; percentage stone dust to render coal dust non-explosive; placing stone-dust barriers	562	—Gibson colliery, magazine	*281		
—Hoisting engineers, Springfield, Ill.—Movement of pointer per revolution of drum; safety valves; defining pressures; horsepower to pull 20 loaded cars; Norway iron, breaking strain of rope and safe working load; hoisting ropes and cages	21	—Glen Rogers	752, 790	G	
—Mine foremen, Olympia, Wash.—Mine inspection by fireboss; mixed lights in mine generating explosive gas; law as to electric locomotives operated by trolley wire in gaseous mine; potential used in trolley system; explosions, causes; law concerning safety lamps 600. Constant used with water gage readings; ventilation; retimbering caved gangway 638. Depth conversion foot of slope; pillar drawing, prevention of accidents	674	—Goshen Coal Co.	798	Galloway Coal Co.	806
—Misc.—Pressure in airway; supplies required by law to be kept at mines for injured; electrical units in common use; effect of opening of door on fan; safety lamp	522	—Hunt mine	762	Gallup-American Coal Co. Cooley	*165, *237, *387, *427
—Misc.—Flow of gas; counter gangway distance on mine map; regulators; fan ventilation; horsepower to circulate in four splits; circulation of air per man; shot-firing in gaseous mine	712	—Kemmerer Coal Co. 296. Discussion	520	Gardner, E. D.	432
—Misc.—Pressure in airways; rubbing surface; distance of crosscuts	846	—Maner Collieries Co. 285. Discussion	519	Gas, ammonia from coke-oven	281
—Misc.—Pumping; unit pressure of steam on piston; treatment safety lamp full of flame; size of pipe; high piston speed; best boiler for use in coal mines; water consumption of boiler; steam gage and safety valve on boiler	112	—Midwest Coal Co.	613		
—Misc.—Removal of gas where air is conducted on split system; cause of explosions of firedamp; examination of gassy mine; systems of ventilation	148	—Official responsibility for mine explosions. Discussion	560	GASES, MINE	
—Misc.—Tensions on main and tail ropes; horsepower of engine determined, water consumed by engine; horsepower of motor	70	—Orient No. 1	824, 856	—Blackdamp become explosive (inq.)	147
—Misc.—Tensions on main and tail ropes; velocity air current; safety instructions from mine foreman to miner	220	—Prevention an unsolved problem	597	—Exam. questions	184, 292, 823
Excelsior, bottoms coal cars	286	—Reden mines, Poland	488	—Ignition gas by sparks (inq.) Luke	*711

COAL AGE

The Only National Paper Devoted to Coal Mining and Coal Marketing

C. E. LESHER, *Editor*

Volume 24

NEW YORK, JULY 5, 1923

Number 1

Not a Strange Decision

REFUSAL by the Interstate Commerce Commission of permission to the Virginian Railway Co. to extend its line across the Guyan River in West Virginia to serve a projected new mine of the Pocahontas Coal Co. throws into the spotlight the question of overdevelopment of the bituminous-coal industry. The transportation Act of 1920 conferred on the commission the power and responsibility of granting or refusing the right to build new railroads or extend old ones, having due regard to present and future public necessity and convenience. In this decision the commission is plainly acting within its powers and is doing that which the law anticipated and provided.

The commission found that the Virginian has not been able to give the full measure of service to the coal mines already on its lines and that the addition of another, as would be permitted by the building of this extension, would not increase the supply of coal produced and carried to market, that it would in fact serve only to dilute the service now possible to mines already existent. Unless the carrier should subsequently add materially to its road equipment, it would decrease rather than increase its revenues by reason of having this new mine to serve. The coal company alone stood to benefit.

Even if the carrier should increase its facilities and thereby make it possible for the new mine to market more coal, the necessity does not exist, in the opinion of the commission, for it says: "There are at present more mines in the country than is consistent with the most efficient use of carriers' equipment, and their aggregate capacity exceeds greatly the country's demand." Thus it appears that the refusal is predicated on two points, one the present fact of more mines on the Virginian than that road may adequately serve and the other that whether or not that be true, there are already too many soft-coal mines in the country for the carriers as a whole to serve properly.

On the second point the commission is not on sound ground; the premise is too general. The general condition of overdevelopment of the bituminous-coal industry cannot reasonably be held to prejudice a local situation. It is easily conceivable that public necessity and convenience might dictate the advisability of further mine development in a particular location. What would have been the decision of the Interstate Commerce Commission in this instance had the coal company shown that it could market the additional coal and the railroad that it could carry it to market? Would the fact that, the country taken as a whole—the Southwest, Illinois, other parts of West Virginia included—there is more mine capacity than is required or than can be served by present railroads have been a reason for denying this extension?

This is the first effective check on development of soft-coal mines. The railroads point out that for many years they have been obliged to meet every request of this

character to avoid discrimination. The Railroad Administration would not permit the Fuel Administration to withhold sidings from new mines. Coal companies, as in this instance, find it better business to bring undeveloped reserves into production than to carry them as overhead. There has developed in recent years an insistent opinion that some way must be found to stay the endless opening of new soft-coal mines. Now that, some three years after its grant of power, the Interstate Commerce Commission has applied the designated remedy in a particular instance, it is well not to jump at conclusions as to the wisdom of the move. It is not, as characterized by the *New York Times*, "A Strange Decision."

This is, of course, regulation of the coal business and not so indirect at that. Its importance as respects coal may easily be over-emphasized—the real point on which a verdict is awaited is the apparent precedent set for all industry.

Lewis Against the Field

THE anthracite mine workers acceded to the request of the U. S. Coal Commission that the Tri-district convention in Scranton last week not bind its scale committee to hard and fast demands. This much favors a peaceful settlement. The scale committee will meet the operators at Atlantic City this week and in a few days is expected have before it the anthracite report of the Coal Commission. The cards will then be dealt and the game go on.

On the face of it the matter at issue is quite simple. The miners want more money for their work. They have framed their desires into some eleven "demands" starting off with 20-per cent increase in wage rates and winding up with many other demands, all calculated to increase their earnings. No one supposes for a moment that the operators will or can afford to grant such demands offhand. The customers of the coal companies do not like the price of coal as it is.

The mine workers will attempt to show that the operators should give them an increase out of profits, for the miners recognize the peculiar interest of the buying public in the price of their product. Following the precedent set by the soft-coal people last spring and under similar inspiration from the Coal Commission, the miners and operators might within a week easily reach an agreement to continue the present contract. This appears to be the logical outcome, whether it is reached in July or in September.

Matters are not so easily arranged in the hard-coal field, however, for the present International officers of the United Mine Workers "belong" less to this field than to the bituminous regions. The anthracite workers have the bit in their teeth and the matter from now forward will be more of a contest between the local anthracite leaders and the Lewis forces than one with the operators.

Dips Under Creeks and Streams

CONTRARY to Mr. Clevenberg's remarks in this issue, a general experience is that the coal under valleys is higher, not lower, than normal. Toward the outcrop, it is true, the coal tends to drop in a series of small faults, the throw of which does not exceed perhaps one to three inches, and is likely also to dip toward the face exposed by erosion, but where the seam passes under the valley no such slipping and miniature faulting can take place, and the coal tends to rise because the pressure of the hill causes the uncovered and unloaded measures in the valley to lift.

The clays tend to flow to the point of reduced pressure and there is some evidence that the coal also has flowed to that point, for it is often somewhat thicker in such places.

What Mr. Clevenberg remarks, however, is a different condition. He assumes that when the coal measures of the Carboniferous era were laid down, the peat was deposited over a slightly rolling surface and that these rolls are still visible as coal dips. It would be interesting to know if manifestations of the kind he describes have any uniform orientation. If they have not his surmise seems unanswerable.

If they have a sort of common direction, then they probably are due to mountain-making movements in little, occurring as they doubtless did occur in the Carboniferous era. The streams may have followed or may not have followed these movements of flexure, for if the latter were slow the streams would continue in their courses and would erode the intersecting flexures as they developed, as has happened monumentally in the Weber Canon in Utah. Mr. Clevenberg very plausibly suggests that as the dips follow the present streams, the original streams followed these dips.

In the Lower and Middle Kittanning beds of Pennsylvania there are well-marked dips running east and west which have neither relation to the topography nor to the mountain-making movements that occurred in the Permian and perhaps in the late Carboniferous era. But because the dips in these measures are so regularly oriented and are obviously different from Mr. Clevenberg's dips does not in any way disprove his theory of the origin of those dips which he describes.

Yet it is interesting to note that the "wants"—the ancient erosions and replacements—in these beds also ran in their main areas east and west, though it is true other erosions and replacements enter them often at right angles. These scars seem to have healed promptly in Pennsylvania. Nothing can be seen in upper beds of the dips that might have been expected to rise from them or from other orogenic movements of like kind. Still at least one fairly large east and west erosion has been determined in the lower Freeport which tends to show that the orogenic movements continued like in kind throughout the laying down of the Allegheny Series. What is stranger still is that the erosion in the lower Freeport is often lacking in the beds lower down. As against this theory is the fact that at least in some sections of Pennsylvania the dips running parallel to the so-called Permian uplift have thicker coal than the summits between them. This seems to suggest that a slight orogenic movement, gentle but not unimportant, and similar to the larger movement in the Permian, occurred during the late Carboniferous period when the uppermost beds were being deposited.

The east and west erosion and dips and the thickening in northeast and southwest dips are contradictory and neither is so generally established as to justify dogmatism and to solve the question as to the line of folding during the deposition of the Allegheny series. Much of what happened during the laying down of that series is still a mystery and will remain so till the subject is carefully studied in the light of recent mine workings and levelings. Mr. Clevenberg, however, has added two interesting observations to aid us in our studies of the Carboniferous era and has offered a reason for them which is hard to gainsay.

The Indianapolis Indictments

BY THE manner in which he announced the unwillingness of the government to prosecute the Indianapolis indictment of the 226 coal operators and mine workers' officials charged with conspiracy under the Sherman law, Attorney General Daugherty added nothing of credit to his record. By a legal move he wiped the charges from the record of Judge Anderson's court and by a declamatory process he sets them up as his own. "In fact," he says, "I believe the acts committed were unlawful."

It has been the current opinion for some time that these defendants would never be brought to trial by the government and that the indictment probably would expire by the limitation of time. We are inclined to be of the opinion that it is Judge Anderson and not Mr. Daugherty who has had the wisdom and courage to *nolle prosequi* it. It remains to inquire whether any good purpose was served by the proceeding and what significance attaches to Mr. Daugherty's threats that "We will get you again if you don't watch out."

The Attorney General said that the public is "fed up" with the idea that there is a "great and stubborn controversy" in the coal industry when in fact there is no controversy at all, that strikes are fake pretensions to alarm the public, under cover of which coal wages and prices are boosted. The facts are, we believe, just the opposite. Wage controversies in the coal industry are real but altogether too many people think they are staged, a belief fostered by these particular indictments and one which Mr. Daugherty is perpetuating. The overhanging threat of this case has greatly interfered with the proper course of wage negotiations in the past two years. The doubt thrown on the whole process of collective bargaining by the proceedings in Judge Anderson's court and the hesitation natural to those operators who were under this cloud in meeting in interstate conferences was a factor of no mean consequence in the strike of 1922.

Nor is the air cleared with the dismissal of the charge in respect to these 226 defendants. "It is essential to the prosperity of both employer and employee," the Attorney General is quoted as having said, "that proper agreements be entered into, and the government is not concerned whether the agreements are made collectively or individually if the things agreed upon are lawful." The general tenor of his remarks to the court are to the effect that these people did a lot of unlawful things but because they would be able to convince a jury of their good intent and the participation of a previous administration in their activities, they could not be convicted. But, if they do unlawful things again, he will get after them.

What is unlawful in the premises?

Carbon Dioxide Succeeds in Fighting Bitner Mine Fire When the Flooding of the Workings Fails*

When Fire Dies, Mine Atmosphere Contracts and Sucks in Air
Unless Given Carbon Dioxide which Cools Mine, and Saves
Fire from Necessity of Generating Its Own Inert Gas

BY CHARLES L. JONES†

MUCH interest should be manifested by coal operators and the state mine departments in the successful way in which the fire in the Bitner mine, of the H. C. Frick Coke Co., was extinguished with the aid of liquefied carbon dioxide. This mine, which is located in the coke region of Pennsylvania, caught fire on the night of Nov. 16, 1922. Prior to the adoption of the unusual method about to be described an attempt was made to fight the fire by flooding, but because flooding failed to stem the spread of the fire, which by Dec. 16 had extended over an area of approximately 13 acres, the management decided to use liquefied carbon dioxide for subduing the conflagration.

From Dec. 16 to Dec. 25 large quantities of this inert gas were administered to the affected workings, after which period the quantities introduced were considerably reduced. It should be mentioned here, however, that the application of water was continued; thus the temperature was lowered without for a moment allowing the atmosphere surrounding the fire to become of a character that would support combustion. Aside from its efficiency in the fighting of mine fires, carbon dioxide appeals by virtue of its low cost and its ease of administration.

Carbon dioxide has been suggested on several occasions in the past as an agent for fighting mine fires, and in a few cases trial has been made of its value. The attempts have met with all degrees of success from complete effectiveness to entire failure, depending upon conditions. However, the relative costs of different sources of inert gas, the quantities necessary to insure success and the technique of inert-gas application have

never been definitely determined in such a way as to encourage conservative mining engineers in making any general application of the method, although the theoretical supremacy of inert gas as a fire-extinction medium has been generally taken for granted.

As typical of the attitude of mining engineers and operators may be cited the attitude of state mine inspectors. After two months of gas application at Bitner had given good indications of success, I addressed a letter to each of the state mine inspectors listed in *Mineral Industry*, stating that certain practical information on the inert-gas method of extinguishing mine fires had been developed, and inquiring as to the number of fires occurring in the various states during the last three years.

Nineteen answers were received, mentioning specifically thirty-nine fires, of which twenty-two were in coal mines. Two states apparently had no fires. Nine replies showed that an effort was being made to keep a record of fires in the states, while ten showed no such effort. One letter expressed doubt as to the efficacy of the inert-gas method, two expressed interest in any information that might be forthcoming, and fourteen showed no interest whatever in carbon dioxide as an agent in fighting mine fires.

Successful applications of the inert-gas method as long ago as 1851, at Clackmannan, Scotland, have been related by Walker.¹ The use of liquefied carbon dioxide as a fire-extinction agent seems to have been first suggested by Barber,² and Spencer³ has described the successful application of liquefied carbon dioxide to a small mine fire.

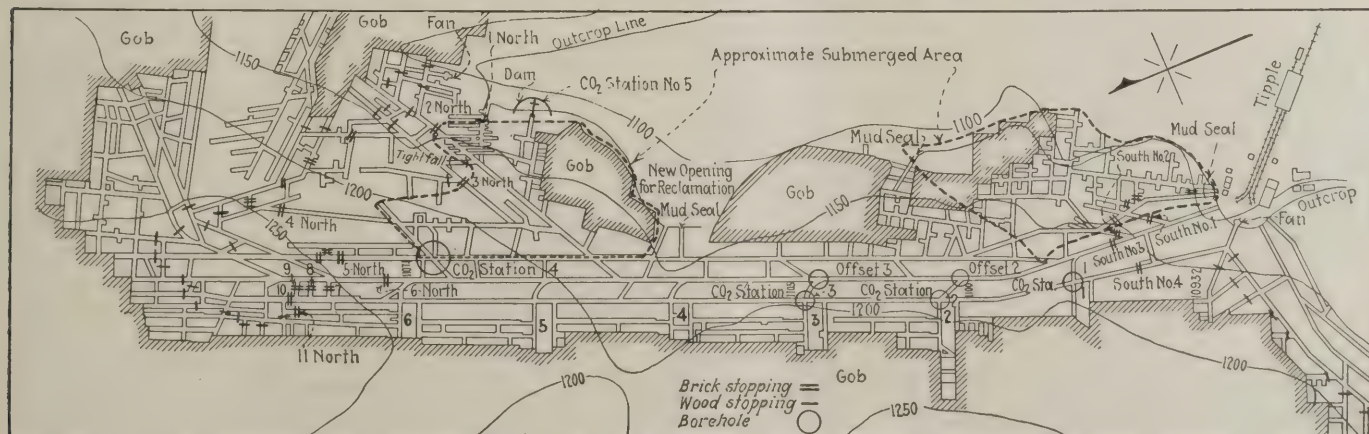

FIG. 1—PLAN OF BITNER MINE SHOWING SEALS AND POINTS AT WHICH CARBON DIOXIDE WAS ADMITTED

The outcrop line on this map apparently was drawn before the coal was extracted and crosses the coal area in places. The coal, however, crops along much of the upper or roughly the eastern line of the

illustration. The coal in the lower left-hand corner has about 150 ft. of cover but the cover is less over the rest of the area and in many places is only about 50 ft. thick, as can be noted by the contour lines.

The weak spots were in the caved rooms near the crop, but water had been run into two-thirds of these reducing the hazard that air might enter and restore the activity of the smoldering fire.

Evans' has told of a fire at Senghenydd colliery in the autumn of 1913, which was treated for several weeks with insufficient quantities of carbon dioxide manufactured on the spot from sodium bicarbonate and sulphuric acid. Even in this case, although water and perseverance finally put out the fire, it is believed that the carbon dioxide rendered valuable assistance in lowering the temperature, minimizing changes in pressure and preventing fresh air being drawn in to the fire area. This last action of drawing in air when cooling and driving it out as the temperature rises is known as the "breathing effect."

On the other hand, it is recorded in scientific literature that carbon dioxide has been employed unsuccessfully in several cases; for example, in the metal mines of the United Verde Copper Co.⁵ However, fires in metal mines occur under conditions vastly different from those in coal mines, particularly with respect to the ratio of combustible material to oxygen supply, consequently the two classes of mine fires cannot be treated in at all the same manner by the inert-gas method. The compressed-air method finally adopted by the copper company mentioned would have played havoc in a coal-mine fire.

Unfortunately, negative results are not often published, and there must be some cases in which the inert-gas method has failed in coal mines, just as there are buildings burned to the ground in spite of modern fire apparatus. In each case a number of variables deter-

mine the success or failure of the treatment, but the fireman at a burning building must use his judgment unaided by any accurate means of determining conditions he cannot see, while the mine fire can be literally "chemically controlled."

The various agencies which may give rise to mine fires have been discussed at length in the literature⁶ and need not be referred to here. It seems that the progress of an imperfectly sealed mine fire has never been followed carefully, either under inert-gas treatment or otherwise, by an adequately large number of systematic gas analyses at various points, as well as by close daily observation of temperatures, pressures, etc., at various parts of the affected area. I was, therefore, glad to have an opportunity to make a complete study of the Bitner fire and to follow up the application of liquefied carbon dioxide to it.

Between fifty and sixty million pounds of liquefied carbon dioxide are produced annually in the United States. Small quantities are obtained from magnesite, from fermentation and from natural mineral springs, but the bulk of it—in fact over 90 per cent—is manufactured by the combustion of coke. High-grade coke is burned under specially constructed boilers, with carefully regulated draft, producing flue gases with 17 to 19 per cent of carbon dioxide. The flue gases are scrubbed to remove dirt and sulphur compounds, and the carbon dioxide is then absorbed in a solution of sodium or potassium carbonate, from which it is boiled out prac-

tically pure. Modern plants are balanced so that there is just enough steam produced from the combustion of the coke to operate the machinery and compress the carbon dioxide into cylinders.

Carbon dioxide is sold in cylinders of two standard sizes, of which the larger contains 50 lb. of gas, equivalent to 408 cu.ft., at 32 deg. F. and 760 mm. pressure, or about 450 cu.ft. under an average atmospheric temperature and pressure. This size of cylinder has an outer diameter of 8½ in. and is 51 in. high. It contains slightly over 150 lb. as an average when filled with gas. These cylinders are all built and tested under Interstate Commerce Commission regulations, and such has been the progress in manufacture and testing that accidents in handling these cylinders are almost unknown. All work in connection with the application of carbon dioxide to mine fires may be performed by common labor.

The turnover on cylinders in the carbon-dioxide industry is very slow, and, as the investment in containers is high, interest charges, depreciation and maintenance equal in aggregate the manufacturing cost. Hence the cost of the gas apparently is high, although it will be shown to compare favorably with other methods for the results obtained. As 90 per cent or more of the output of liquefied carbon dioxide is used in the soft-drink trade, the business is necessarily seasonal in nature, but stocks in most large cities are sufficient to assure an immediately available supply of gas at any mine located near a center of population.

The refrigerating effect of the gas expanding from

the pressure in the cylinders deserves special mention. When the gas is discharged directly from the cylinders to the atmosphere or into a mine, this refrigerating effect is sufficient to reduce a part of the gas to the form of a snow, which has a temperature colder than 100 deg. F. The cooling effect of this snow in the mine is not as valuable as its action in excluding air from the fire, but it is important nevertheless. This cooling effect is not an unmixed blessing, however, for it occasionally stops up the cylinder valves with snow, thus retarding the discharge of gas. At the Bitner fire, therefore, the valves were kept thawed by means of torches when for a comparatively short time it was desired to obtain very high rates of gas input. Means have since been developed of avoiding this mechanical difficulty, without recourse to torches or to any other source of heat.

Carbon dioxide has been used successfully for fighting fires in other places than coal mines. One branch of the Bell system uses small cylinders of carbon dioxide for extinguishing fires in telephone switchboards, and for many years it has been used for smothering fires on shipboard. It is a method now well recognized by shipping experts and has the indorsement of the fire underwriters in Scandinavian countries. It has been more recently introduced on some American shipping with good results, and possesses many obvious advantages, especially in that it does not damage valuable cargo and in that it penetrates portions of the vessel which could not be reached with a hose.

FIG. 2—TIPPLE, BITNER MINE

The Bitner tippel is quite close to the opening of the mine, as can be seen in the map. The easy hill slopes can be noted in the rear of this illustration.

ships provided with automatic appliances, thermostatically released, for discharging carbon dioxide into the vapor space of the oil tanks. Used in this way it makes a positively non-freezing and non-corrosive extinguisher. Two central-station companies have equipped turbo-generators with appliances for extinguishing fires with carbon dioxide.⁷

The principal function of carbon dioxide in fighting mine fires is not so much to extinguish fire *per se* as to prevent inward leakage of air, whether it occurs as compensating for fluctuations of barometric pressure or as the result of the cooling of the mine atmosphere.

To illustrate the latter point, consider an underground working which is comparatively tight, the fire in which could be extinguished easily by accepted methods of sealing off. If the fire is a hot one and occupies a large percentage of the sealed-off area, the average temperature in the fire area may easily reach 240 deg. F. In such a case the contraction in cooling to normal temperature would be about 25 per cent of the gas volume in the fire area. Assuming no leakage, this would mean a pressure difference across the brick stoppings of about 3.7 lb. per square inch, which, due to leakage, is never observed in practice. Obviously the answer is that leakage is important even in this case. It would be interesting to know how much more quickly such a sealed-off fire might be opened under inert-gas treatment than when sealed off without such treatment, especially where the fire area cuts off all access to important workings.

Another simple way of presenting this theory of mine-fire behavior is to consider the relation of the two heat quantities—namely the heat generated by combustion, and the heat dissipated. The heat dissipated may consist of heat removed by running water through the mine, heat conducted through adjoining strata, heat transferred by air currents from hotter to cooler parts of the mine and heat dissipated by direct ventilation of parts of the fire zone where the temperature is already relatively low and no combustion is taking place. It is difficult to treat the whole subject in any precise manner, as there are so many variables in each case, but some study will convince the reader that water is the agency with the greatest potentiality for rapid cooling in an emergency, assuming that conditions are not such as to generate large volumes of steam or water gas.

When these two heat quantities are approximately equal—the heat generated and the heat dissipated—the fire does not either grow or die down very rapidly, and we say that such a fire is smoldering. In fact smoldering is *prima facie* evidence that these two heat quantities are approximately equal. Now, relatively speaking, we have no control over the quantity of heat dissipated by conduction through the adjoining strata, although, to be sure, this varies with the temperature of the mine. We can, however, control the quantity of heat generated by controlling the inward leakage of air. It is obvious that when this leakage is decreased until the heat generated becomes less than the heat dissipated, the mine must cool and we are moving toward extinction of the fire. It would be desirable to avoid leakage altogether, but it should be noted that this is not necessary.

CARBON DIOXIDE BETTER THAN SULPHUR DIOXIDE

Other inert gases have been proposed for fighting mine fires, namely, sulphur dioxide, nitrogen, and flue gases. Sulphur dioxide in its actual effect on fire has some advantages over carbon dioxide, in that it is heavier and is more effective in abstracting heat. Pure sulphur dioxide in liquid form is too expensive and not available in sufficiently large quantities to warrant consideration in most cases, and flue gases which can be made by burning sulphur under practical conditions still contain such large percentages of oxygen that they would be much less effective, for example, than a carefully produced flue gas from direct combustion of coal or coke. Furthermore, very small percentages of sulphur dioxide render atmospheres irrespirable, while men can tolerate without ill effects any percentage of carbon dioxide which will not extinguish a safety lamp, and in some cases even more.

Nitrogen is obtained in large quantities in the manufacture of oxygen by the liquid air process. The ratio of cylinder weight or shipping weight to the weight or volume of gas contained introduces high transportation charges, however, so that nitrogen need be considered only where the fire to be extinguished is close to the plant shipping the nitrogen. Further, carbon dioxide is more effective than nitrogen, at least for gaseous combustion.⁸

Flue gas is the only serious competitor of liquefied carbon dioxide for fighting mine fires and has been used successfully for the purpose. But it is not as effective

⁸J. K. Clement, "The Influence of Inert Gases on Gaseous Combustion," U. S. Bureau of Mines, Technical Paper 43.

FIG. 3—HAULING CYLINDERS BY TRACTOR TO STATION
This also gives an idea of the easy contours of this region.

⁷Electrical World, 80 (1922), 165; idem, 80 (1922), 1089.

FIG. 4—ONE OF THE CARBON-DIOXIDE STATIONS

Station No. 3. Nothing elaborate was needed. A simple canvas shelter served to protect the operations. A small stock of cylinders is lying on the outside of the station.

as carbon dioxide, it contains some oxygen, it is not as easily transported and distributed over large areas, and it requires for its preparation and application equipment which requires some time to assemble. The liquefied gas excels it in the following particulars:

(1) Liquefied carbon dioxide is 100 per cent effective. Flue gas is effective only in proportion to the oxygen which has been removed from it. Inexperienced help cannot prepare flue gas containing 19 per cent of carbon dioxide in any kind of improvised apparatus. The production of gas having that percentage of dioxide requires considerable care and close regulation of draft. The availability of comparatively large quantities of water for cooling the flue gas is an additional necessity. Though flame is extinguished by moderate percentages of carbon dioxide, incandescent carbon will continue to absorb oxygen until low percentages of residual oxygen are reached. The residual oxygen introduced with flue gases is, therefore, undesirable.

(2) Liquefied carbon dioxide in most cases is quickly available. The motor truck has placed most of the country's coal mines within a few hours of the nearest liquefied carbon-dioxide plant, and a minimum of special equipment is required for application of the gas. Flue-gas application requires time and trouble for the installation of special equipment.

(3) Liquefied carbon dioxide is portable. In the Bitner mine fire, gas was introduced through six stations or units, separated by considerable distances along a line over 2,000 ft. long. Once an entire station was moved to a new location where it appeared to be more effective. It would have been expensive and difficult to distribute flue gas in this manner from a centrally located boiler.

On the other hand, flue gas unquestionably is cheaper per cubic foot where it is to be used in sufficient quantities and over a long enough time to pay for the equipment that must be installed. I believe that flue gases and liquefied carbon dioxide have distinct and special fields, and that flue gases should be used wherever: (1) Plenty of time is available between the decision to apply the gas and its actual application. (2) Leakage is very great and it is evident that large volumes of inert gas will have to be applied over long periods of time in order to put out the fire. (3) The nature of the fire is such that portability is not a consideration.

The Bitner fire was discovered on the night of Nov.

16, and is supposed to have been caused by a grounded trolley. However, from its later behavior, it seems possible that more than one source of fire may have played a part. At any rate, the fire spread notwithstanding the best efforts of the fighters, until the length of the area actually on fire was 2,400 ft. At this point in its advance J. R. Campbell, chief chemist for the company, suggested that inert gas be considered. On Dec. 13 decision was made to try liquefied carbon dioxide, and by the afternoon of Dec. 16 1,440 50-lb. cylinders of carbon dioxide had been hauled over 60 miles by motor truck, a line of 25 brick-stoppings in the mine surrounding the fire area had been completed, some of the surface leaks caused by falls along the outcrop of the coal seam had been sealed, facilities had been provided for discharge of gas into the mine through three boreholes, and at 3 p.m. the first gas was discharged into the mine. Much better time might have been made had it not been necessary to plan and construct discharge facilities on the ground.

The drums were discharged into the mine through boreholes in units of five, each unit being housed separately in a temporary shelter with wooden roof and canvas or jute sides. On of these units is shown among the accompanying photographs. Before commencing to apply the gas, seven boreholes were drilled from the surface into the mine workings, and four of these holes were used for the introduction of gas. The casing in the boreholes was reduced to 2 in. at the top, and led to a manifold of 2-in. pipe with $\frac{1}{2}$ -in. branches.

Gate valves were provided in all units and branches, so that any drum or unit could be disconnected without permitting a back rush of gases from adjacent units or from the mine. Each drum was connected to the $\frac{1}{2}$ -in. type through a $\frac{1}{2}$ -in. sleeve and nipple of ordinary weight by means of a ground union. In general, the five drums of each unit were discharged all at once and changed on regular schedule, allowing from two to eight hours between changes. However, the schedules were laid out on a basis of the trend of gas analyses, pressures, and temperatures in the fire zone, and on occasion a drum was discharged completely in less than half an hour, while, on another, drums were changed only twice daily.

Each of the shelters was heated by a salamander which burned coke. No difficulty was experienced in discharging the gas, although torches had to be used to empty the cylinders completely when they were dis-

FIG. 5—RACK OF GAS CYLINDERS AND MANIFOLD

The discharge pipes of the gas cylinders are connected with a manifold through which the carbon dioxide passes to the borehole. The piping becomes frosted owing to the intensity of the cold generated by the evaporation of the carbon dioxide. The dioxide freezes at a temperature of 100 deg. below zero, F.

FIG. 6—BRICK STOPPING SHOWING METHOD OF TAKING GAS SAMPLES AND TEMPERATURE READINGS

An oak pole was used to pass the apparatus into the hole and pull it out again. All stoppings were patrolled at regular intervals and indications of each visit were marked on the wall of the stopping.

charged at the higher rates. Occasionally, after the mine had become comparatively cool, plugs of ice were formed in the boreholes from ground waters seeping through the earth below the bottom of the well casing and coming into contact with the cold carbon dioxide, but this ice melted when operations were temporarily suspended.

Gas samples were taken through $\frac{1}{2}$ -in. pipes cemented into the stoppings and through boreholes not used for gas input. Temperatures were taken by means of tapered hardwood poles about 4 ft. in length, made to enter and plug a 2-in. pipe through the stopping up to the last 6 in. of their length. They thus protruded inside the stopping some 30 in., and carried on the inner end a thermometer placed in a groove and fastened. These thermometers were left in position continuously, except when withdrawn for reading, and the error introduced by withdrawing them for this purpose is believed to have been small. Temperatures also were taken at the bottom of the boreholes by means of maximum-minimum thermometers. The locations at which these analyses and temperatures were taken may be identified on the map (Fig. 1).

It will be observed that the boreholes actually used for gas input have been numbered from south to north, and that the south stoppings and the north stoppings have been numbered separately. Although the total number of brick stoppings is twenty-five, the number of effective stoppings separating fire areas from respirable gases is fifteen, four on the south end and eleven on the north.

Pressures were measured only a part of the time and then by means of an Ellison draft gage. At other times they were noted simply as positive (outward) or negative (inward). Where fans were ventilating the area outside the stopping, the fan pressure must be added or subtracted from the observed differential pressure, in order to get the relation of the inside pressure to the atmospheric.

Gas samples were analyzed in a Burrell type Orsat apparatus lent by the Pittsburgh station of the U. S. Bureau of Mines, and acknowledgment should be made to D. K. Smith, who did much of the work. Analysis was made for oxygen, carbon dioxide and carbon monoxide. Occasional check analyses showed the methane to be about 2 per cent. Soon after the work of extinguishment commenced, decreasing to about 1 per cent before the mine was opened.

Hence, in interpreting the analyses, which often were of nine gases more or less diluted with air, the methane content was assumed to be 2 per cent of the combined firedamp and blackdamp, inasmuch as inleaking air, of course, carried no methane. The factor used in converting oxygen percentage to air was 4.3. Samples were taken daily, and oftener when necessary, until Jan. 25, and every other day thereafter.

Firedamp, which is held to include combustible gases, is taken as the sum of experimentally determined carbon monoxide and the assumed methane content. Blackdamp (constituents which will not burn or support combustion) is then 100 per cent less the sum of the air and firedamp. The advantage of a calculation made on this basis, which will be obvious to most mining men, lies mainly in the direct indication of the percentage of air, which is an index of leakage. Furthermore, by its means we are able to determine the quantity of carbon dioxide in the blackdamp, thus eliminating the confusing effect of leakage when interpreting the gas analysis in the light of the quantities of gas introduced.

The rate of gas input and its effect are shown in Fig. 7. It will be seen, gas input started Saturday afternoon, Dec. 16, and on Dec. 24 reached the maximum rate of 355 50-lb. cylinders of carbon dioxide in 24 hours, or 159,750 cu.ft. The greater part of the carbon dioxide—some 230,000 lb. was introduced in all—was administered during this period. On Dec. 25 and 27 the rate of delivering gas received its first decided cut.

Referring to Fig. 7 it will be noted that the percentage of carbon dioxide in the blackdamp commenced to decrease at this time, and continued a "long-swing" decrease throughout the rest of the work, except as brief increases were caused by the lowering of the barometer or by further changes in the rate of gas input. The suggestion that the leakage from the fire zone must have been between 80,000 and 150,000 cu.ft. per day under average conditions at once presents itself, but this does not follow directly, as the number and distribution of the points where gas samples are taken has a direct bearing on the average figures obtained.

The "average" is not a true figure expressing the average volume composition of the mine gases but only the arithmetical average of samples taken at accessible points. Table I gives records for reference, the com-

FIG. 7—DIOXIDE IN BLACKDAMP AND AS FED TO HOLES

The lower graph should be read as continuous with the upper graph. Note that the base line of what should be the right half is 10 and that of what should be the left half is 12. The figures of the blackdamp are average figures for all points of test over the entire field and the quantities of carbon dioxide also are totals for all the stations.

FIG. 8—"CHEMICAL LABORATORY," BITNER MINE

All that was needed was a portable Orsat apparatus of the Burrell type, a thermometer, a barometer and a pyrometer. This small outfit constitutes a complete laboratory for mine-fire control.

plete record of gas analysis for No. 2 and No. 4, both south, together with the values of temperature and pressure readings. An inspection of the volumes required to effect the changes in gas composition shown will confirm the statement that the mine is exceptionally leaky.

Throughout the operation gas analysis proved to be a most useful means of predicting changes and in controlling the gas input. Gas-analysis variations can be correlated consistently with barometric changes and the comparatively large quantity of gas taken up by the mine during the earlier stages without producing violent outward movement of gases can be explained only on the basis of rapid cooling. Unfortunately the temperature records are not as complete as might be desired, but this is not felt to detract much, as temperature data obtained at stoppings must be interpreted with the utmost caution. Every temperature reading so obtained is affected by the direction of the gas movement.

Perhaps the best example of this is at South Stopping No. 4, where the gas analysis was conspicuously unsatisfactory and for a larger percentage of the time than at any other point. This point was particularly sensitive to barometric changes, and the tendency toward inward movement of gases at this point seemed to be greater than at the other stoppings sampled. Temperature readings at this point were always satisfactory, fluctuating somewhat with outside temperature so long as air temperatures were taken inside the stopping and showed a steady cooling when the area immediately adjacent to the stopping was later flooded.

Several times during March it was reported that the gas analysis was such as to encourage fire in this local area, and on March 19 some increase in carbon-monoxide percentage at this point was noted. When the mine was finally opened a small hotbed of smoldering coke was discovered a short distance inside, which fortunately was so limited in extent as to be easily extinguished and

loaded out. All temperatures recorded in this end of the mine were below 75 deg. F. before the mine was opened. Therefore, it is quite safe to say that gas analysis has proved itself capable of indicating conditions not recorded on a thermometer—at least when the thermometer is placed near a stopping and when the gas movement is inward.

A second excellent example of incorrect indications of temperature is in the increases noted at many points during December, when carbon dioxide was being introduced at the greatest rate and when the gas analysis indicated that no fire could exist in the sealed-off area.

This apparently puzzling phenomenon was caused merely by the establishment of a current of gas outward from hotter portions to the cool stoppings, due to the large quantities of gas introduced. Under certain conditions, then, rising temperatures around the edges of a sealed-off fire may be hopeful signs that the leakage it outward, while falling temperatures may indicate only inward leakage. One does not look for high temperatures at the fan intake of a forced-draft boiler setting.

Breathing, thermal contraction and other influences may change the gas analysis considerably at any given point yet if there is no fire behind a given stopping the percentage of air will vary without changing the proportions of nitrogen and carbon dioxide in the synthetic blackdamp which has been built up by adding carbon dioxide to the normal blackdamp. This result is modified somewhat through absorption of oxygen by the coal, but it is at least roughly true.

No. 4 South Stopping will again serve as the example, for the fire referred to above could not affect the analysis of the gases immediately behind the stopping to any great extent, inasmuch as it was over 100 ft. from the stopping and the prevailing draft was inward. Between Dec. 27 and 30 the carbon dioxide in the total sample at this stopping went down from 19.2 to 2.2 per cent and then back to 20.1, due to barometric fluctuation, but the carbon-dioxide percentage in the blackdamp remained practically constant, between 20 and 22.

The variation of the carbon-dioxide percentage in the blackdamp and its relation to the amounts of gas introduced are shown in Fig. 7. The direct variation of gas composition by analysis with barometric fluctuation is to be expected. However, barometer readings are not included in Table I, as the mine is more sensitive than the barometer in its response to changes in atmospheric pressure. Thus, the pressure observations at the stoppings are more significant than the barometer readings for showing the direction of flow of the mine gases. Table II illustrates the variation of gas analysis with barometer readings:

TABLE II—VARIATION OF ANALYSIS WITH BAROMETER

Date	Barometer reading, 9:00 A. M.	Average Carbon Dioxide Percentage in Samples Over Entire Field
Jan. 15.....	28.24 (falling)	13.4
Jan. 16.....	28.20 (rising)	11.0
Jan. 17.....	28.90 (rising)	9.9
Jan. 18.....	28.32 (falling)	12.8

Three different agencies played parts in the extinction of the Bitner mine fire: gas, water, and sealing. Before the gas was applied but after the fire was sealed an inspection of the ground, coupled with observations of the behavior of the fire, afforded ample basis for the statement that the conflagration probably would never have been extinguished by sealing alone. At least it may be said that it could not have been put out by this method unless, at tremendous expense, the falls had been

laboriously mud-sealed for a distance of nearly one-quarter mile along the outcrop of the coal seam. A considerable area was never reached by water. That is clearly indicated by the high-water line marked on the map (Fig. 1). It is, of course, safe to say that the fire would not have been extinguished in this area by any combination of sealing and water treatment.

Water was of the greatest assistance, however, in rapidly cooling certain parts of the mine which could be reached by it; in fact without water cooling it would have been impossible to open the mine within reasonable time. In addition to the sections where it was possible to submerge the roof, and hence make certain of the absence of fire, other sections which could not be flooded were treated for a part of each day with running water.

As the specific heat of water is much higher than that of gases, comparatively rapid cooling was attained. It should be emphasized that the main function of this running water, which did not reach the roof over the greatest part of the area affected by it was not to extinguish fire but to produce rapid cooling, and in this action it was very successful.

Water was not applied, moreover, until Jan. 5, after gas analysis indicated that all flame had been extinguished, and when the temperatures recorded made it evident that the possibility of forming large quantities of steam or water-gas, or of causing violent fluctuations by the introduction of water, was remote. Under these conditions cooling was much accelerated.

By building surface dams at both ends of the mine it proved possible to back the water inside the mine to the high-water line shown on the map. Without some such scheme it would have been impossible to flood any considerable part of the mine.

Reference has already been made to the refrigerating effect of carbon dioxide expanding from cylinders. The main cooling effect of the inert gas, however, is due to the exclusion of air. It may be assumed that each pound of carbon dioxide introduced prevents an equivalent weight of air from gaining access to the fire. Consequently it will prevent the generation of something like 600 B.t.u. and hence will relieve the adjoining strata from having to conduct this quantity of heat.

HAVE NOT HAD NEED TO OPEN ENTIRE FIRE AREA

On March 26 a new opening was broken through the coal about the middle of the fire area, as indicated in Fig. 1. Starting from this point, by the present time (June 1, 1923) the fire area has been explored and reclaimed from end to end along the main haulage, manway and air return, and along the main gob areas on the west side of the mine. Some hot coals have been found, but the hot material was confined to small areas where the gas had not been fully effective and was in such condition that it could be wetted down and loaded without serious difficulty.

It is worthy of mention that as the combustion was early checked by the introduction of inert gas and as the area subject to fire was cooled more slowly than by the direct use of water, less injury was done to the roof.

Coal is now being produced from the reclaimed area. Smaller areas on the east side of the mine—that is, along the outcrop—have been sealed up pending the time when it will be convenient to explore and reclaim them. So far as is definitely known, there is no flame in these areas, but hot spots may exist. Exact conditions in these relatively small parts of the mine will not

be known unless and until they have been explored. For obvious reasons, some worked-out parts of this area may never need to be opened.

The quantity of liquefied carbon dioxide used, and hence its cost, will depend upon the leakage and the length of time during which gas must be applied. These conditions will vary, of course, for different mines.

In the case of the Bitner fire the actual cost of the carbon-dioxide gas alone is less than 10 per cent of the total sum spent to date, the remainder being largely the expense of the direct method of fighting. Under average mine-fire conditions, if there are any average conditions, bad mine fires probably can be extinguished with inert gas for less than 50 per cent of the cost of the direct method.

It is clear that the application of inert gas should be restricted to fires which can be sealed sufficiently to avoid the consumption of prohibitively large quantities of gas. Its use is indicated wherever it is impossible to seal off the fire tightly enough to extinguish it by this means alone, and it is possible that money can be saved by reason of quicker reclamation even where good sealing is practicable. It can extinguish fires under certain conditions more cheaply than any other method. As soon as inert gas is applied it arrests the combustion of coal and the depreciation of the mine by reason of roof falls, etc. and it makes possible early opening of sealed-off areas. That it will be invariably successful, if employed intelligently under the proper conditions, cannot be denied.

State Coal Laws Handicap Retail Dealers

In a letter to its members, the New England Coal Dealers' Association, Boston, Mass., has the following to say in connection with the new coal laws in some states, referring particularly to the "Governor's Coal Law" in Massachusetts:

"The new Laws in some states are causing a little trouble for the regular dealer, but we have one case in Massachusetts where an inspector took a sample, served a legal notice on the dealer that effectively stopped coal being sold from the bins in question. 'Physical examination of this coal indicates it is unfit for ordinary use and subject to condemnation and seizure,' is the language. In this case the coal analyzed 94 per cent pure. The dealer's business suffered and he might have been closed down for over a week if he had had only the two bins in question. He has a right to sue the inspector for damages. The idea of any coal which analyzes 94 per cent pure having the appearance of being unfit for ordinary use is a preposterous situation, and the consumers of Massachusetts will find the 'Governor's Coal Law' a serious handicap the next time we have conditions similar to last winter."

DISTRICT ENGINEERS OF THE BUREAU OF MINES and the engineers on its mine-rescue cars have been instructed to make written reports, whenever possible, to mine operators, containing recommendations for more effective prevention of accidents and for improvement of health conditions in the mines examined. An extract from the order issued in this connection is as follows: "The chief purpose of these safety service reports is to present directly to the operator the results of such safety investigations of the Bureau as may be specifically applicable to his particular mine, to the end that the work of the Bureau for the promotion of safety in the mining industry may be made more effective. These reports, of course, would also include suggestions and recommendations relative to safety methods, devices and practices observed in visits to other mines by Bureau engineers, which they believe could be adopted to advantage in the particular mines covered by the reports. Adoption of the recommendations in such a safety service report rests entirely with the mine operator, and the recommendations must be reasonable and practicable ones."

Theory and Operation of Electric Braking As Applied to Mine Locomotives

Greatest Field of Use on Locomotives Making Many Stops—Reduces Maintenance Costs—Proof Against Common Abuses—Transition from Motors to Generators Explained—Motors Always Started in Series

BY EDGAR J. GEALY

Electrical Engineer; Associate Editor, *Coal Age*

WITHIN the last few years the electric trolley locomotive, as designed for mine service, has undergone several important improvements. One of the most interesting changes has been the application of the electric-braking controller. By means of this new controller positive and graduated braking is obtainable without the application of the mechanical brake except for finally holding the locomotive and trailing load at rest.

The greatest field for the use of this new type of controller seems to be on the gathering type of locomotive, yet there are many opportunities for its use on main-haulage locomotives, especially in conditions where long grades are met, and it is necessary partially to apply the hand brake. The main-haulage locomotive as a rule makes few stops; it starts from some point where it picks up a trip of loaded or empty cars and few stops are made en route to the shaft bottom or to a distributing point where it delivers the cars. In its work the motorman is less frequently required to operate the brake than on the gathering locomotive which makes many starts and stops.

The gathering locomotive ordinarily makes many starts and stops during the day, its trips are short and frequently the locomotive and cars must be stopped at switches, room entrances and whenever couplings must be made. The very nature of the work of the gathering locomotive therefore requires frequent application of the brakes and much more braking effort must be expended in the operation of the locomotive. Consequently while the gathering locomotive is lighter in weight than the main-haulage machine the sum total of braking effort in a day is considerably greater. Aside from requiring more effort on the part of the motorman these frequent starts and stops are very hard on the equipment, wearing the brake shoes, brake rigging, flat spots on the tires and subjecting the locomotive to strains. Furthermore, the motorman may often be found to operate the locomotive with the mechanical brake partly on, with the idea of being ready at all times for a quick stop. This procedure greatly overloads the motors and frequently results in breakdowns.

LESS BRAKING EFFORT REQUIRED

To relieve the motorman of most of this braking effort the electric braking controller was applied. With this new controller the locomotive is retarded by the stored-up energy in the form of momentum in the moving locomotive and trailing load. This is accomplished by providing a controller with a suitable cylinder for changing the motors of the locomotive into self-excited generators. The electrical energy developed by the generator action is absorbed in the main resistors. The amount of braking thus obtained is a function of the speed at which the locomotive drives

the motors as generators and the resistance in the circuit.

With a fixed value of resistance in the circuit, the faster the locomotive is moving at the time the motors are converted into generators the greater will be the generated voltage, the greater will be the current flowing through the resistance and the greater will be the retarding effect. Under the same conditions decreasing the resistance will increase the braking effect, while increasing the resistance will decrease the braking effect. Therefore under all conditions under which the locomotive may be driving the motors as generators the less the resistance in the circuit the greater will be the retarding effect upon the locomotive. In fact it is merely a question of loading up the generators until their driving force has spent its energy and can no longer carry the load. As on any other generating system the lower the resistance across the terminals of the machine the greater the load and consequently the greater is the tendency to stop the driver and therefore the generation of power.

When the motors are acting as generators and there is considerable resistance in the circuit the locomotive will spend considerable time in giving up its energy, which is in the form of momentum; but when the resistance is mostly cut out the locomotive must give up its energy more quickly and therefore comes to a rather quick stop.

When the locomotive is nearly stopped there is a point where the speed of the motors, acting as generators, is not sufficiently high to generate enough voltage to produce the necessary current to produce any further braking effort; at this point, and at all speeds slower than this it is necessary to apply the hand brake to bring the locomotive to a stop. By this method and the various graduations of resistance which may be inserted in the circuit it is apparent that the locomotive may be brought to a gradual stop without

FIGS. 1 AND 2—SERIES MOTOR AND SERIES GENERATOR CONNECTIONS

The first figure shows the dynamo operating as a motor and having a certain direction of rotation. The second figure shows the same dynamo operating as a generator. The armature is running in the same direction as when it was a motor. Closing the circuit on the generator with its series field reversed represents how electric braking is accomplished.

FIG. 3—CONNECTIONS OF ARMATURES AND SERIES FIELDS FOR BALANCING TWO SERIES GENERATORS

The armature of generator No. 1 is connected in series with the series field of generator No. 2, and the armature of generator No. 2 is connected in series with the series field of generator No. 1. This maintains an equal voltage on both machines, thus balancing the load while employing electric braking.

motors, when acting as generators, is sufficient to insure almost as quick a stop as when the trolley is connected. This is an important factor in estimating the all-around serviceability of electric braking in gathering work, because failure of voltage on the trolley or the flying of the trolley pole off the trolley wire would otherwise result in serious consequences.

On a level track the motorman can bring his train to a dead stop without using the ordinary hand brake at all if he can wait long enough for the friction of the track and bearings to absorb the small amount of energy remaining in the trip after the electric braking has all but stopped the train. In fact, this is the usual condition, the action being relatively quick. He also can readily bring it to a stop on a grade by setting his mechanical brake; otherwise the locomotive will come nearly to a stop and will continue to run at a slow speed. A runaway is impossible so long as the train weight and grade are within the braking capacity of the motors (acting as generators) and the control equipment.

Another point of advantage in electric braking lies in the fact that the retarding effect of the motors is zero as soon as the wheels have stopped rotating, and there is practically no skidding of the wheels; hence there will be few if any flat spots developed from this cause.

In order to understand the operation of the electric braking controller it may be interesting to review some of the important characteristics of the series motor and series generator which bear upon the subject. To clarify the matter we will use the word dynamo as the general term for a motor or a generator and when the dynamo acts as a driver it will be called a motor and when it acts as a generating machine it will be called a generator.

A series motor generates a counter-voltage which tends to stop the incoming current that drives the motor. If a series motor is running and it is suddenly disconnected from its supply it will continue to run and generate a counter-voltage. Should the motor be short-circuited or even closed on a resistance of low value the counter-voltage would cause a flow of current through the circuit, but the direction of this current would be such as to oppose the residual magnetism in the field poles which created the counter-voltage. This counter-voltage therefore would create a current which

the application of the mechanical brake and the attendant strains. The degree of braking is under the motorman's control at all times, for if he finds that he is stopping too quickly, he merely has to throw off the controller or step back a notch or two, thus inserting more resistance into the circuit. It has been found by numerous tests that even with the trolley disconnected the residual magnetism of the

would kill the residual magnetism in the fields and in so doing would reduce the counter-voltage to zero.

If the field of the motor is reversed with respect to the armature before the motor is short-circuited, however, the current flows in a direction through the series fields to increase the magnetism in the fields. In this way the motor becomes a generator. By loading up the circuit leading from the generator a retarding effect is produced which will tend to bring the generator to rest.

Fig. 1 shows a given connection of armature and field with a certain direction of armature rotation and the dynamo acting as a motor. Fig. 2 shows what changes must be made to change the motor into a generator. Note that with the direction of rotation the same, the series field connections have been reversed and the generator is loaded on a variable resistance to obtain electric braking.

Electric braking is quite simple when only one motor is used. When two or more series motors are used in parallel as generators some provision must be made to balance the current between them, because the voltages which they generate are rarely exactly the same in value due to small variations in construction and the composition of the magnetic frames.

If two series motors are operated in parallel as series generators, the dynamo generating the greater voltage will force current through the one generating the lesser voltage, and this current will be in a direction opposite to the direction of the inherent generated current in that generator. The result is that the polarity of the weaker generator is reversed and the two machines generate a current into a short-circuit between themselves. Under these conditions the line wires leading from the parallel connection of the two generators has no influence upon the operation of the machines, regardless of the value of any external resistance between the line wires.

To overcome this condition is rather simple when only two generators are involved. The fields of the two generators are interconnected so that the armature of one generator is in series with the field of the other. The connections are as shown in Fig. 3. This arrangement prevents an interchange of current between the two generators as an increase in the armature current of one generator increases the current in the field of the other, causing it to generate a higher voltage, thereby taking a heavier current until the load on each generator becomes balanced.

FIG. 4—COMPLETE ELECTRIC BRAKING CIRCUIT WITH TICKLER CIRCUIT

The circuit from the trolley through one of the series fields to ground assists the series field residual magnetism and quickens the action of the motors when converted into generators for electric braking.

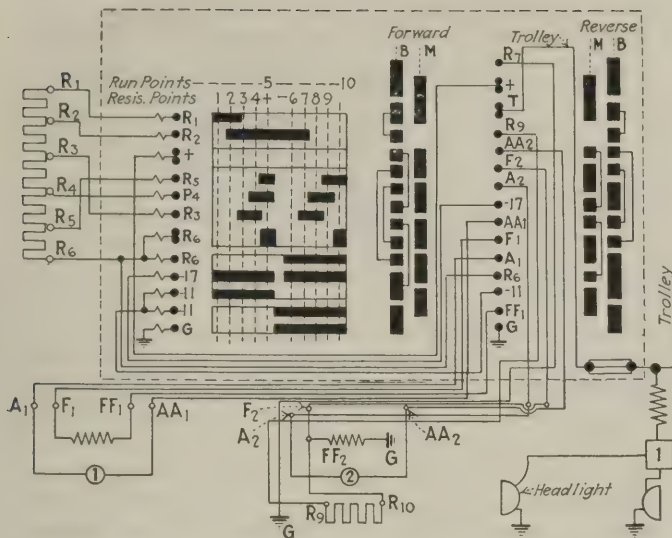

FIG. 5—COMPLETE ELECTRIC-BRAKING CONTROLLER WIRING DIAGRAM

The arrangement of the controller is quite similar to the other designs used on locomotives in mine work. The diagram shows that the wiring may hardly be classed as being more complicated than that of the ordinary controller.

To assist the residual magnetism to build up the strength of the series field and thus make the generators take their load more quickly a small current is allowed to flow through the series field of one of the generators by means of a circuit from the trolley wire through a high resistance and thence through the series field to ground. The generators will build up without this connection but the braking effect is a little slower in acting when this connection does not assist. This connection is illustrated in Fig. 4. In the diagram it is apparent that changes in the variable loading resistance varies the braking effect of the generators.

The wiring diagram of the electric braking controller as manufactured by the General Electric Co. is shown in Fig. 5. This controller embodies several additional features of special interest and importance.

With the ordinary controller careless or indifferent motormen do not always use the hand brakes when they want to stop. In many mines it is a rather too frequent practice for the motorman to needlessly "plug" the motors—that is, reverse the motors to save effort when a stop is to be made. When stopped in this way, the motors sustain a heavy rush of current and the gearing and other parts of the equipment receive severe shocks, all of which tend to shorten the life of the various parts or cause immediate damage and high maintenance costs.

Another novel feature of this controller is that the locomotive must first be started with the motors and resistance in series before the transition can be made to the parallel operation of the motors. Most controllers will start with the motors either in series or in parallel. Here again the indifferent motorman will not use the series position for slow running or for starting a load. Instead he will leave the reverse cylinder in the parallel position and start or get slow speed by running with the motors in parallel and the resistance in the circuit. This increases maintenance costs on controllers and resistances and also consumes twice as much current as that necessary for the same speed and load in the series position.

This method of operation of the locomotive with the motors in parallel when they might better be in series raises a serious question in additional power consump-

tion. In many cases this represents a serious economic loss when a number of gathering locomotives are used. The total amount of energy wasted in this way in a year is always a matter of consideration to the engineer who is desirous of maintaining a high over-all efficiency for the electric system of the mine. Another objection to this method of improper operation is that the additional current required means additional transforming and generator capacity and also feeder capacity, while it is also the cause of circuit breakers opening up on overloads and thus penalizing all other equipment in that section by discontinuing operations until the service is restored.

This electric braking controller is a positive insurance against this particular form of waste and abuse, as it is of the series-parallel type similar to that used on the ordinary street car and the first point is always "series-motors." Consequently the motorman cannot get to the parallel operating position of the controller until he has gone through all the series points.

Fig. 6 shows a top view of the controller. The handle in the middle of the controller, called the operating or control handle, regulates the resistance in the circuit when the dynamos are acting either as motors or generators. When the dynamos are acting as motors the control handle may be operated through ten positions; the fifth position is the series running position of the motors with no resistance in the circuit and the tenth position is the parallel running position with no resistance in the circuit. These points are specially marked on the controller and should be used as much as possible, thus saving wear and tear on the resistance and also power consumption.

In the motoring position the control handle may be operated through all ten positions for either forward or reverse running. In the braking position the control handle cannot be operated beyond the fifth position. The braking increases as the handle is turned on from the first position to the fifth position. At the fifth position the locomotive will come to a quick stop. To stop dead or to hold the locomotive stopped on a grade it is necessary to operate the hand brake. All braking, except the last operation of stopping the locomotive dead, should be obtained by the use of the electric braking feature of the controller. The transition from motoring to braking or vice versa in either direction is made by the operation of the lower right-hand lever, which is locked in position until the control handle is first returned to the "off" position. This insures the proper manipulation of the equipment under all conditions. The control resistance is so balanced that when the controller is in the no-resistance

FIG. 6—TOP VIEW OF ELECTRIC BRAKING CONTROLLER

With both the operating handle and reversing handle in the off position in order to start the locomotive forward, first move the reverse handle, located on the right, to the position marked — "motoring forward" — and then move the operating handle on. To brake, move the operating handle to the off position, move the reverse handle to the position — "braking forward" — and then move the operating handle on through the first five positions as required. For motoring or braking in the reverse direction the operations are similar, as indicated by the other positions of the reverse handle.

FIGS. 7, 8 AND 9—HOW THE CONTROLLER OPERATES IN STARTING A LOAD

When the controller is operated to start a load, the motors are started in series, then later changed over to the parallel connection. All of these changes, together with changes in the amounts of resistance in the circuit, are accomplished by simply rotating the operating handle from the off position to the tenth position. This is the only operation necessary after once setting the reverse handle in the forward or reverse motor position.

series position, and the load or grade becomes severe enough to cause the wheels to spin, by moving the operating handle to the parallel position the wheels will recover their grip on the rails, provided the load is not beyond the capacity of the locomotive.

In Figs. 7, 8 and 9 the various connections of the motors and resistance are shown as the motors are being brought up to speed when hauling a load.

It is true that with the electric-braking controller the motors on the locomotive are in operation both while taking energy from the line as motors and while braking the locomotive when operating as generators. For this reason the total heating of the motors and resistance will no doubt be greater for a given day's work than with the ordinary controller. To partly offset this tendency toward too great heating, the fact that the electric controller is insurance against starting heavy loads in the parallel connection of the motors and against other abuses requiring high current consumption is important. Then again the high motor horsepower per ton of locomotive weight now used on locomotives is most favorable. With many locomotives the high motor horsepower per ton of weight has been adopted not so much from a point of view of necessary heating capacity for the work to be done as from a desire to have a locomotive whose motors cannot be overloaded, this being accomplished by making the motors so large that the locomotive will slip its wheels before the overload capacity of the motor has been exceeded.

No doubt, there are some conditions, however, under which the extra heating of the motors when used as generators in electric braking must be considered, but a proper balancing of these factors should present no serious problem.

SIZE OF PULVERIZED COAL.—There is no definite size to which coal must be ground for use in powdered-coal burning plants, although it is recommended, generally, that 95 per cent of the pulverized coal should pass through a sieve with 100 meshes to the inch and 80 to 85 per cent through a sieve with 200 meshes to the inch, states John Blizard, fuel engineer of the Department of the Interior, in Bulletin 217, just issued by the U. S. Bureau of Mines. It has been found possible to operate some furnaces with coarser coal, and found necessary for firing open-hearth furnaces to grind the coal more finely.

Are Valleys Usually Accompanied by Dips, And, if so, What Is the Explanation?

BY G. F. CLEVENBERG

Civil and Mining Engineer, Williamson, W. Va.

THE mountains of our southern West Virginia coal field are supposed to have been formed by erosion, that is, the streams have carved out the present topography from a plateau that was originally almost flat but which had a small dip to the northwest. This plateau, which composed the deltas of the Pennsylvanian, was raised by the great mountain-making movement of the Permian. The streams and rivers which flowed through this plain of low topography had their channels necessarily in the small structural dips of the strata and started immediately after the uplift to cut down into the soft and barely consolidated top strata of the old delta, and, continuing down in their meandering course, reached the beds of today, still retaining in their intrenched meanders the course they had followed when the country was level.

In many of our mines in the Williamson coal field I have noticed that when the working places approach any large branch or hollow the coal dips more sharply into the hollow, and sometimes this is so marked that the general dip is reversed. Often an entry approaching a hollow will begin to dip at a point about 500 ft. distant from the stream in the valley, making much trouble because of the water encountered. This dip continues till the stream is overhead, whereupon the entry begins to rise and gets back on the normal dip again in a short distance. In one mine with which I am familiar this happened when the workings passed under a small branch stream, and in another mine when the operations approached a fairly large creek. In each case the coal dipped toward the creek at about a 14-per cent grade, and flattened out after reaching the stream or creek. The normal dip in this last-mentioned mine is only about 50 ft. to the mile.

I have wondered whether this condition is universal in the dissected plateau coal fields of southern West Virginia. If so the circumstances described conclusively prove that the original streams of the plateau took their courses in the small structural dips in the strata, and if such conditions can be expected when approaching and passing under streams the trouble can be anticipated and preparations made for meeting it successfully. Such a dip would not be revealed in all cases, in fact it would be apparent only where, in the vicinity of the larger hollows, many prospect holes were opened and a careful survey was made in which the levels and elevations of the base of the coal would be carefully determined.

It would be interesting to hear from other mining men whether this condition is generally encountered where mines of the southern West Virginia or the eastern Kentucky coal field pass under the streams and the larger hollows of those regions.

THE SIOUX INDIANS claim that the United States owes them the neat sum of \$750,000,000. Let us hope that they won't occupy the Pittsburgh coal-mining district.—*Tacoma Ledger*.

MR. FOSTER is in favor of "direct action." Do not deceive yourself by thinking that this means work.—*Minneapolis Journal*.

Helical Gear Reduction Unit for Mine Fan Meshes Without Impact and Saves Space

DESIRE for flexibility in the speed of ventilating fans and the wide difference in speed between fans and electric motors early led to the adoption of a belt drive because it was believed that by this means the number of revolutions per minute most readily could be varied to meet an ever-changing operating condition merely by the use of a large or a small pulley on the motor shaft. The change of pulleys in accordance with this plan is not made frequently for the reason that a marked change in the ventilation system is in evidence only at widely separated periods. So one might justly say that the average fan installation has a constant speed, and therefore, a gear drive is expedient for the purpose.

There are disadvantages which are generally accepted as facts in the driving of a fan by a belt. Power lost through slippage is perhaps the most notable of all. Even with constant attention under favorable conditions, where the shafts are accurately aligned and the belt is precisely adjusted for tautness, there is certain to be a loss of energy between motor and fan.

Reliability in the performance of vital equipment at the mine is not merely a desirability but a necessity. To obtain it without resorting to a direct drive by an unduly large slow-speed motor, gears and pinions are employed, as, for instance, on pump units. A gear drive for a mine fan is equally as effective, and in consequence offers the mine manager a surety of fan operation. It is no more flexible than the belt drive nor is it less flexible. It is far more desirable than a belt drive in that the complete unit is compact and takes up no more space than a motor-generator set, resembling the

latter closely, as may be seen by an inspection of the accompanying illustration. Consequently the fan house can be made smaller than for a belt drive. An increased fan speed can be obtained by substituting a larger pinion for a smaller one; or the fan may be driven by a variable-speed induction motor which is provided with a brush-shifting device.

An interesting example of a gear-driven fan installation is that of the Carnegie Coal Co. at its Cedar Grove mine, Studa, Pa. Here a 12-ft. exhaust fan which makes 120,000 cu.ft. of air per minute against a water gage of $1\frac{1}{2}$ in. is driven by a 125-hp. two-speed induction motor through a standard helical gear reduction unit which was furnished by the R. D. Nuttall Co., of Pittsburgh, Pa. The fan is so situated that it will be near the center of the workings for the next ten years or more. During the day a speed at the motor of 720 r.p.m. is reduced to 90 r.p.m. at the fan. At night or when the mine is not working the motor and fan speeds are 360 and 45 r.p.m. respectively. The gear set is incased in a housing which shelters the moving parts from dust and dirt.

The helical gears are smooth running and quiet because of their design. The slight angle of the teeth provides a mechanical condition in which there is always contact between them. As a result there can be no lost motion or chatter in the meshing of teeth, and the load is transferred without impact from the pinion teeth to the gear teeth even when the pinion is worn. Moreover, the tooth design is such that the rolling contact is increased 50 per cent for the reason that the base of the tooth is wider and thicker than is the base of the ordinary teeth of a spur gear or pinion.

Safety in Electric Welding and Cutting*

THE art of welding and cutting by means of the electric arc is subject to certain rules and safeguards recommended by fire insurance and safety organizations for the preservation of property and for protection of health, eyes, and bodies of the operators. Experience has shown that the fire hazard is not serious, due to the fact that the immediate presence of the operator and the concentrated attention which his work requires help to prevent the start or spread of any fire originating from flying sparks or molten metal.

For protection of the operator and of men working in the vicinity it is necessary to take certain precautions. If these precautions are taken arc welding becomes a perfectly safe occupation. There are at present some sixty thousand welders using the arc. We have several welders at our plant who have worked steadily with the arc for six or seven years without any apparent bad effect. In ordinary arc welding, where currents ranging

INTERIOR OF FAN HOUSE AT THE CEDAR GROVE MINE
The drive end of the fan unit as pictured closely resembles a motor-generator set. A temporary wooden structure was erected to house the unit but at a later date this will be replaced by a brick building.

*Paper presented at the Safety Conference of the National Safety Council, Engineering Section, and the Detroit Safety Council, Detroit, June 12, 1923.

from 50 to 200 amp. only are used, simple precautions are necessary for the protection of the operator's eyes and the exposed portions of his body. The usual method of protecting eyes is the use of a face shield or head mask with glass window inserts, the glass of which is of such a composition as to absorb the injurious ultra-violet and infra-red rays. When several welders are working in the same room, in addition to the use of face shields or head masks colored glasses with side protection are worn to protect the eyes of each operator from the arcs of the others.

All exposed parts of the body are subject to a burning effect from the rays of the arc. This burning is similar to a sunburn and if the body is not protected by a covering of some kind it will cause the operator more or less discomfort or pain. The body usually is covered by ordinary close-woven clothing and the hands by leather gloves, not only to protect against the rays of the arc but against flying particles of hot metal. The gloves further protect him in handling hot parts. In heavy carbon arc welding and cutting, where currents from 200 to 1,000 amps. are used, it is necessary to protect the operator still further, as with these heavy currents the arc rays will penetrate the ordinary clothing and the flying particles of molten metal will burn through them. Usually a large, well fitting leather or asbestos apron is used, protecting as much of the body of the operator as is possible.

For the protection of men working near an arc welder opaque screens should be placed between the arc and the workers or, better still, a booth should be built around the operator, thereby shutting off all the arc rays from the surrounding part of the factory.

Care has to be taken regarding the painting of the interior of an arc welding booth. If a paint that reflects the rays of an arc is used the operator may be subjected to eye flashes from the side and back of his face shield, or to the burning of the back of his neck or ears. A paint that will absorb the dangerous rays should be used on the interior of a booth and on all equipment located within it. A simple, satisfactory paint for this use is composed of zinc oxide and oil, which may be given any desired tint with lamp black.

Where heavy welding or cutting is being done and where galvanized iron or steel or materials that are oily is being welded it is desirable in safeguarding the health of the operator to provide ventilation ducts or fans to carry away the smoke and fumes.

In metallic arc welding where direct current is used with an open circuit voltage of from 40 to 60 volts and a welding voltage of 20 it is not necessary to pay much attention to the protection of the operator from an electric shock. With alternating-current welding this is a little more serious, as the operating voltage ranges from 100 up to as high as 175. If the operator is not careful while changing electrodes the higher voltage is likely to give him quite a shock. There is no positive way to protect the operator against this voltage, however, if he is in direct contact with one side of the circuit in handling his work and with the other side of the circuit in inserting his electrode material. He must be careful not to get in contact with both at the same time.

This same condition applies to resistance welders used for railway work where the trolley voltage is from 450 to 650 direct current. In this case it is necessary for the operator to be careful to keep free from grounds while changing electrodes. Welding resistors for use in

railway welding are sometimes provided with a push-button station under the control of the welder for opening a contactor in the welding circuit while changing electrodes. However, many welders object to carrying around this pushbutton station and would rather take the extra precautions necessary when changing electrodes.

In many installations where a large number of small articles are welded, particularly with the automatic welder, instead of building a booth around the operator to protect outside workers and instead of providing the operator with a mask or face shield an inclosed cabinet is built around the operation itself, inserting in this cabinet a colored glass protective window through which the operator can watch the progress of the welding.

Where many welders are working on small work it is customary to build a series of small booths, the tops of which are open and extend above the operator's head, the front of the booths being supplied with the welding control apparatus and with a bench on which material to be welded is placed. The backs of the booths are protected with a series of curtains which are closed by the operators before starting to weld. This makes a compact and satisfactory arrangement.

For the protection of welding apparatus, safeguards, as applied to apparatus of similar nature, are used such as circuit breakers, contactors, fuses, enclosed switches, enclosing boxes for control apparatus, insulated couplings, gear cases, insulated holders, etc.

General Electric Co.

Schenectady, N. Y.

To Avoid Clinker Trouble

(1) Keep your slice bar out of the fire. Ashes, when mixed with incandescent coal, melt and cause clinker.

(2) If you have to use the slice bar, run it gently along the grate bars, raising it just enough to break up the clinker.

(3) Throw water into the ashpit. It turns to steam, which softens the clinker.

(4) Run a $\frac{1}{2}$ -in. steam line into the ashpit, or, if necessary, install a small steam blower. The steam rots the clinker and the air increases the draft.

(5) Overheated grates cause clinker. Keep the ash-pit doors open.

(6) Throw out all sulphur balls and pieces of slate before firing. They make clinker.

(7) If you have to force your boiler, use high fusing coal. —*Courtesy W. A. Marshall & Co., New York.*

SPONTANEOUS COMBUSTION OF PENNSYLVANIA COALS.—In the course of a study of the spontaneous combustion of coal being made at the Pittsburgh experiment station of the U. S. Bureau of Mines, J. D. Davis, chemist, and J. F. Byrne, research fellow, conducted experiments on spontaneous heating of coal starting from room temperature. Upper Freeport heated 3 deg. from room temperature in six hours. Upper Kittanning coal gave no heating whatever. This corresponds to results of practice. Kittanning coal usually is sold by dealers with a guarantee not to fire. It is semi-bituminous and similar to Pocahontas coal but not so fireable. Pittsburgh coal rose a maximum of 2.7 deg. above room temperature in 72 hours. The rate at first was rapid, then slowed as the temperature continued to rise—higher temperature again caused acceleration. In these experiments the coal was first treated in a current of coal gas to bring equilibrium with the thermostat, then a current of oxygen was passed through under adiabatic conditions. The apparatus seems to work satisfactorily and the problem now resolves itself into finding the optimum rate of air or oxygen flow as a means of comparing the heating qualities of coals.

New Equipment

Solid Steel Frog Requires No Splice Bars

A NEW cast-steel frog cast in one solid piece and hence requiring no splice bars for its installation was recently placed on the market by L. A. Green, of Pittsburgh, Pa.

The absence of rivets and bolts in the construction of the frog eliminates opportunity for acids in the mine water to loosen up the various parts. The rails are bolted to the frog by means of extension pieces, similar

DURABIL STEEL FROG

Probably more derailments occur at frogs and switches than at any other place in the mine track. These derailments frequently are due to loose track accessories. Here is a frog which is made of one piece, thus reducing the number of parts to a minimum.

to splice bars, which are cast as an integral part of the frog. This arrangement makes a very rigid joint.

The composition of the steel used in the manufacture of the frog is asserted to be such that the frog will outlast several of the more common types of frogs used for mine work.

New Universal Thermal Relay

A THERMAL relay designed to be universally applicable to any surface has recently been brought out by the Automatic Reclosing Circuit Breaker Co., of Columbus, Ohio. A brass bulb at the lower end of the relay makes contact with the surface whose temperature is to affect the operation of the relay. A liquid element in the bulb expands with the heat transmitted to the bulb and operates a push-button switch at the upper end of the relay.

A novel feature in connection with this push-button switch is that it may be placed in the housing as readily to make the relay circuit closing as circuit opening. This makes the relay applicable to control circuits which would shut down a machine or give a signal. After the relay has operated, the push-

MAL RELAY AND
BRACKET

C is the mounting bracket and E the adjusting screw for properly locating the relay. The over-all length of the relay is 6½ in.

button switch is reset by depressing the button shown at B in Fig. 2.

Obviously, the relay may be adapted to any system of control using either the circuit-opening or circuit-closing feature.

The relay was designed primarily for the protection of electric motors against overloading and overheating, which may be caused by any number of reasons such as single-phasing, too frequent starting, overvoltage, etc. It is applicable also to the bearings of small machines and also to transformers.

The uses of the relay seem to be unlimited as it may even be used to start spare generating equipment when the operating generator equipment heats up due to continued overload.

A Globe Valve with Many Improvements

THE line of equalized reciprocating valves made by the Murphy Valve Co., of Columbus, Ohio, is complete, the company announces. Outstanding features of the Murphy Globe valves, already on the market are, the higher the pressure the tighter the valve seats itself, one-piece disk and stem, removable cap, and the valve can be packed under pressure. When the valve is closed the pressure is confined in the lower half of the valve body so that there is no pressure on the stuffing box. It may therefore be packed on the line while under pressure. This arrangement also causes the disk to seat itself more tightly when closed, the pressure exerting a closing force upon the disk. The disk and stem of the valve make it impossible for the disk to become loosened on the stem, a common occurrence on valves used on feed lines where there is a pump pulsation or water hammer.

GLOBE VALVE WITH MANY
NEW FEATURES

The pressure on the inlet side of the valve is exerted against the disc, which seats itself on the valve seat more tightly when closed. The drain cock may be opened and the valve cleaned of sediment by the pressure of the lines.

Another interesting and important feature is that the valve may be opened at the drain cock and the pipe line drained from both directions. This is a sure protection against frozen and burst pipes and a ready means of cleaning the line.

M. GEORGES, CHIEF MINING ENGINEER OF FRANCE, says that while America possesses coal reserves of 2,000,000,000 tons; Germany, 410,000,000,000 tons; England, 190,000,000,000 tons; Russia, 60,000,000,000 tons; and Austria and Hungary, 54,000,000,000 tons, France has only a supply of 17,000,000,000 tons. The normal pre-war consumption of coal in France was 60,000,000 tons a year, so that France should have sufficient fuel for 300 years. In his opinion France has ample time to evolve alternate forms of energy and to devise ways and means to economize in her coal consumption.

Problems of Operating Men

Edited by
James T. Beard

Faulting of an Inclined Seam in Coal Mining

Strike of Fault Plane Seldom Parallel to Strike of Seam—Fault Plane May Have Any Position Relative to Plane of Seam

THE issue of *Coal Age* for April 12 contained a number of interesting articles, but I was particularly absorbed in reading that by James S. Chalmers, page 589, regarding the working of highly inclined seams. That in connection with the inquiry on "Locating the Coal Beyond a Fault," page 608 of the same issue, leads me to offer the following suggestion.

References made by previous writers, in regard to locating the coal beyond a fault, incline me to think they almost invariably assume that the strike of the fault plane follows the same direction as that of the seam itself. Of a dozen or more faults I have encountered in inclined seams, this has never yet been the case.

Invariably, the strike line of the fault plane makes a considerable angle with that of the seam itself. The angle may reach 90 deg. For that reason, it is impossible to illustrate the true nature of the situation on a profile similar to what has been presented.

It is clear that should the fault plane be perpendicular to the plane of the seam it would correspond to the plane of the profile or, at least, its strike line would be parallel to that plane and nothing would be effected.

ISOMETRIC PERSPECTIVE SHOWING FAULT OF DISLOCATION

Evidently, a perspective diagram similar to that I am showing in the accompanying figure is needed to illustrate the real situation.

With that end in view, I recently constructed a model of plastic clay, in the shape of a rectangular prism. In order to represent the coal seam in this model, I inlaid a piece of cardboard ABC , inclined at a considerable angle with the sides of the prism.

This being done, the next step was to cut across the entire block or prism in a plane $mno p$. In the figure, this plane is indicated as having a strike that makes an angle of 70 deg. with the strike of the seam and has a pitch or dip of 50 deg. from the horizontal plane. The cutting plane $mno p$ is intended to represent the plane of the fault.

Again, on the right of the figure is shown an isometric perspective that illustrates clearly the relative situation of the two sections of the seam, after the slip has occurred. It is evident that the calculation of the continuance of the seam beyond the fault is not as simple as when the strike of the fault plane parallels that of the seam.

As shown on the right of the figure and as often happens, the movement has taken place in two directions, one corresponding to the dip of the fault plane and the other being in a horizontal direction as a side-slip. Keeping these things in mind, a careful study of the figure will show that the movement may either increase or decrease that which would take place were the strike lines parallel. In other words, the dislocated portion may be either on the side of the footwall or the hangingwall, depending on the angle of the strike line and the relative inclination of the fault plane with that of the seam.

In every case, a practical mining man, after making an active survey of the fault, will be able to determine how to proceed to find the continuation of the seam. For example, in the case shown in the figure, he would start driving a crosscut to the right in the hangingwall.

What Is Lacking to Make Mines Safer

Certificate laws in many states—Mine superintendent the responsible head—His certification needed to insure safety in the larger mines.

NUMEROUS references have appeared recently, in the columns of *Coal Age*, regarding the reduction of mine accidents. It has been shown how a large percentage of them are such as might have been prevented had the management possessed the proper regard for avoiding possible accidents.

All of us have our own way of thinking and each is guided by his own intelligence and personal experience in the work of mining. What I have to say, however, may be of interest to operators and a benefit from a human and economic standpoint.

It is well known that the principal coal-producing states have laws requiring the employment of certified mine foremen, assistant foremen, firebosses and, in some instances, hoisting engineers. There are few who will deny that these laws have proved a benefit to mine owners and mine workers alike. Our mines, today, are worked under better conditions by reason of these laws.

On the other hand, any one who has given the matter serious thought can hardly fail to realize that the present certification laws apply more effectively to smaller mines where the mine foreman is generally the responsible head. The same is not the case at larger mines, employing a superintendent whose duties make him responsible for the safe operation of the entire mine both underground and on the surface.

My candid opinion is that our certification laws, in order to be effectual in the safe operation of all mines, should be extended so as to include the certification of all mine superintendents and others having direct charge of work underground.

It cannot be denied that the superintendent, by virtue of his position, exerts a powerful influence on the work of the mine foreman, even where the latter is supposed to have a free hand in the management of underground operations.

There are mines where the management is awake to this situation and realizes that the mine foreman should be the responsible head in respect to underground conditions where he is given a free rein. But more often the foreman is seriously handicapped either for lack of material or in respect to the character of the men he is obliged to employ.

CO-OPERATION OF SUPERINTENDENT AND FOREMAN

It goes without saying, that the most effectual system possible, in the operation of a mine, is that where the mine superintendent and mine foreman work together on a mutually equal plane of knowledge and experience in the operation of the mine.

If this was true at all mines, there would be no need of asking that our certification laws be modified. However, instances are numerous, in fact it might be said to be a general rule, that the management of many large mines are not alive to the seriousness of the situation as it regards the actual responsibility for the safe control of underground work.

The superintendent being regarded as holding the higher office is very generally considered the responsible head and the mine foreman is made subject to his orders. It is this fact that creates a dangerous state of affairs, under conditions that may arise with frequency in the operation of a mine. Therefore, it is only fair and reasonable to require the same degree of knowledge and experience of underground work on the part of both the superintendent and the foreman if they are to co-operate mutually.

DANGER IN FOREMEN SELECTING THEIR ASSISTANTS

There is still another phase of this subject concerned in the selection and appointment of assistant foremen. It is unwise to leave their selection wholly to the foreman. Human nature is human nature the world over and, however competent and honest a foreman may be, he cannot be expected to choose as his assistants certain ones whom he knows aspire to his position and who, it may be, possess certain qualifications superior to his own.

As "competition is the life of trade," it is also the one element that offers the strongest inducement to mine officials of every class to make their work efficient and produce results. Therefore a chief factor, in the efforts of managers to make their mines safe, is to promote honorable competition throughout the rank and file of their employees.

Let me say in closing that the employment of a superintendent who has not the knowledge and practical experience regarding underground operations is like attempting to run a mine car on three wheels instead of four. It is an expense to the company, a detriment to safe operation of the mine and a positive handicap to a good foreman in charge of the work underground. That has been my experience as mine manager. In this state (Illinois) the foreman of a mine is called the

"mine manager" and the fireboss is termed "mine examiner," which many think better describes his duties in the mine.

Then, finally, if our mines are to be made safer, accidents reduced to a minimum and profits increased, all officials in direct charge of work must be men of practical experience, who should hold certificates of competency granted by the state examining board. The question of the certification of mine superintendents is not new to the readers of *Coal Age*, who have argued in its favor almost universally.

DAVID YOUNG.

Edwardsville, Ill.

Electric Cap Lamp a Part of Every Fireboss' Equipment

Constant efforts made to improve lighting in the mine—Electric cap lamp the fireboss' friend—Reasons why firebosses need the lamp.

I HAVE read with interest the several letters that have appeared in recent issues of *Coal Age*, relative to a fireboss using an electric cap lamp while testing for gas. The subject calls to mind different references I have seen in books and periodicals, regarding the earlier methods of supplying an illuminant that would be free from danger in an explosive mixture.

One statement that seems almost unbelievable says that the earliest attempt made to illumine the darkness of the mine consisted in the use of fishes eyes and other putrid matter that gave a phosphorescent glow in the Egyptian darkness underground. A little later, this means of lighting gave place to the use of the old "steel mill," which was a disc of metal made to revolve very rapidly in contact with a piece of flint, causing a continuous shower of sparks.

PROPERTY OF WIRE GAUZE DISCOVERED BY DAVY

Both of these means proved most unsatisfactory and it remained for the eminent chemist, Sir Humphry Davy, in 1815, to discover the property of cool wire gauze to prevent the passage of flame through its mesh.

This discovery of Davy gave to the mining industry a lamp that produced a good light and was safe in the presence of explosive gas. The well known Davy lamp is still a favorite among a great number of firebosses who have long been accustomed to its use in making their examination of the mines.

Following the introduction of the Davy lamp, more than a hundred years ago, many improvements have been made and various types of safety lamps are now in use. The chief object has ever been to increase the illuminating power of the lamp and its security in a gaseous mixture. The result has been that a flame safety lamp capable of giving more than 1 cp. has been produced and approved by the Bureau of Mines as being safe for use in gaseous mines.

ADVENT OF THE MINERS' ELECTRIC CAP LAMP

Now comes the electric cap lamp, which is another advancement in the work of finding a better light that is safe in gas. It is universally agreed that this incandescent lamp or bulb is of no value for testing for gas, its usefulness in the mine being confined solely to the giving of a good light, which is the equivalent of several of the best types of safety lamps.

In this connection, it is amusing to read the claim of one writer that he "cannot spare the time to hide his electric lamp which blinds his eyes when making a

careful test for gas." His account of having to shed his coat, vest and overshirt and even then finding his trousers wet from perspiration is a suggestion of an endurance test as a footracer, rather than a test for explosive gas.

TIME SAVED BY ELECTRIC CAP LAMP

In my opinion, the man would save time by carrying an electric lamp in his cap, which would enable him to move about more quickly and with less exertion, and he would not then need to lower and raise again the flame of his safety lamp to make each test. It would take less time to screen his cap lamp with his hand when making a test, than is now required to lower and raise the flame of his safety lamp.

Those who claim that a fireboss "should use no other light than that of an approved safety lamp," must remember that the electric cap lamp is also an approved

lamp for use in gas. The laws, in many states, require the fireboss to examine for *all* dangers and, for that purpose, he should have as good a light as any other person entering the mine.

Briefly stated, the reasons why a fireboss should use an electric cap lamp, in connection with his safety lamp, is that the brighter light of the cap lamp will enable him to travel faster and detect danger of insecure roof and coal that he would not observe with the dim light of his safety lamp.

Also, he will be safer when climbing high falls and steep pitches that require his attention and a good light to reveal the conditions existing about him. Lastly, in the event of the safety lamp being extinguished, which often happens, the light of his cap lamp will enable the fireboss to retreat to a place of safety where he must relight his safety lamp.

Inquiries Of General Interest

Withdrawing Mine Timber When Robbing Pillars

Careful Examination of Roof Conditions
the First Requisite—Use of Chain Post Puller
Keeps the Workman Out of Danger Zone

MANY accidents are recorded as the result of drawing timbers, in the work of robbing pillars. As is well known, it is of the utmost importance to leave no timbers standing in the waste, since they act to prevent the fall of roof whereby the pressure on the pillars is reduced and the work of robbing made less dangerous. In our mines, we have resorted to different methods of removing these timbers when drawing back the pillars, and though I can say that we have had comparatively few accidents in that work, the results have not been altogether satisfactory.

One method, which we adopted because it promised greater safety to the men, was to blast out the timbers when they could not be knocked out with any assurance of safety. A hole was drilled in the post, say ten inches or a foot below the roof, and a small stick of dynamite inserted and exploded in the hole. This method, however, had the disadvantage of destroying such posts, which were buried in the fall of roof and lost forever. I want to ask for an explanation of the most practical way of recovering mine timbers in a condition to be used again in the work of robbing. MINE FOREMAN.

Clifty, Tenn.

The growing scarcity of mine timber makes its recovery in good condition an item of economic importance in the operation of mines. Not only is the supply of timber conserved, but the cost of production in the mining of coal is greatly reduced. On this account the method of blasting out timbers should only be employed where it is impossible to remove the posts with safety, by other methods.

The most practical method to adopt for the recovery of post timber is to employ a device known as the "Chain Post Puller," the use of which is illustrated in Fig. 1. When employing this device it will be ob-

FIG. 1—DRAWING A POST WITH A CHAIN POST PULLER

served that the workman operating the machine is wholly outside of the danger zone, being protected by substantial posts standing between him and the timber he is pulling.

No explanation is needed regarding the operation of the device, the action of which is clearly shown in the figure. A short tail chain serves to anchor the machine to the foot of a post stood, for that purpose, in a good foothole cut in the bottom to give the post the needed resistance to the pull of the chain.

A longer chain is made fast around the head of the post that is to be pulled. The other end of this chain is attached to a movable piece that travels on the rack bar shown in the figure. By means of the hand lever there shown, this sliding piece is moved backward on the barrel, notch by notch, producing a great strain on the chain that pulls the head of the post free from the mine roof.

In Fig. 2 is shown the anchor post mentioned above, with a short length of chain attached to its foot. The use of this device has prevented many an accident from occurring in the dangerous work of drawing mine posts.

Examination Questions Answered

Hoisting Engineers' Examination, Springfield, Ill., Mar. 19, 1922

(Selected Questions)

QUESTION—An indicator attached to a winding drum is run by means of a gearwheel meshing with a worm on the end of a shaft, and the small gearwheel that is connected to the pointer has 15 teeth. If the circumference of the dial is 32 in., how far will the pointer move for each revolution of the drum?

ANSWER—Assuming that the worm is on the end of the drum shaft, each revolution of the winding drum will pass one tooth of the gearwheel attached to the pointer. Then, since the gearwheel has fifteen teeth, the pointer will make one complete revolution of the dial for each fifteen revolutions of the drum. Therefore, in a single revolution of the drum, the pointer will move $1/15$ of the circumference of the dial or $32/15 = 2-2/15$ in.

QUESTION—Name two kinds of safety valves and state which is the best type of valve to employ.

ANSWER—The spring safety valve and the ball-and-lever valve. The latter is being rapidly replaced by the former, because of the greater reliability of the action of the spring valve, in response to any change of pressure.

QUESTION—Define the terms: Forward pressure; back pressure; mean effective pressure; and state what is the difference between pressure above the atmosphere and pressure above a vacuum?

ANSWER—In steam engine practice, the term "forward pressure" relates to the pressure of the steam in the cylinder, acting to drive the engine. The term "back pressure" relates to a certain resisting pressure, which is opposed to the motion of the engine and caused by the resistance of the discharge ports to the escape of the exhaust steam from the cylinder.

The term "mean effective pressure" relates to the average pressure of the steam, in the cylinder driving the engine, and is equivalent to an assumed constant pressure of the steam throughout the length of the stroke.

The difference between pressure above the atmosphere and the pressure above a vacuum, is best explained by saying that the former is the effective working pressure producing motion in an engine exhausting against the atmosphere, disregarding the loss due to any back pressure in the cylinder. On the other hand, pressure above a vacuum is the absolute pressure, which includes both the working pressure and the pressure of the atmosphere.

QUESTION—How many horsepower will it take to pull twenty loaded cars up an incline 400 ft. long, in one minute, the weight of the coal in each car being 3,000 lb. and the weight of the empty car 900 lb., if the resistance of rope and pulleys is 13 per cent and the grade 7 per cent?

ANSWER—The total moving load, in this case, is $20(3,000 + 900) \div 2,000 = 39$ tons. Then, assum-

ing a track resistance of, say 15 lb. per ton, the grade resistance being 20 lb. per ton, for each per cent of grade, or $7 \times 20 = 140$ lb. per ton, on a grade of 7 per cent, the total resistance of track and grade is 155 lb. per ton, to which must be added 13 per cent for the resistance of ropes and pulleys, giving a total resistance of $155 \times 1.13 = 175.15$ lb. per ton of moving load. This makes the total resistance when hoisting a loaded trip of twenty cars weighing 2.36 tons, $175.15 \times 39 = 6,830.85$ lb., which is the average pull or load on the rope, under the assumed conditions. Finally, assuming an average velocity of 400 ft. per min., with a load of 6,830.85 lb. on the rope and an efficiency of 85 per cent in the hoisting engine, the required power of the engine for this hoist is

$$\frac{6,830.85 \times 400}{0.85 \times 33,000} = 97.4, \text{ say } 100 \text{ hp.}$$

QUESTION—(a) What is the tensile strength of Norway iron? (b) Give the breaking strain of a $1\frac{1}{2}$ -in. crucible, cast-steel hoisting rope having six strands, nineteen wires each; and state the safe working load?

ANSWER—(a) The ultimate strength of Norway iron varies from 48,000 to 50,000 lb. per sq.in., and the elastic limit of the metal varies from 26,000 to 27,000 lb. per sq.in.

(b) The breaking strain of a $1\frac{1}{2}$ -in. crucible, cast-steel hoisting rope, six strands, nineteen wires, is given by the formula

$$S = 39d^2 = 39(1\frac{1}{2})^2 = \text{say } 60 \text{ tons}$$

In mining practice, the factor of safety employed for hoisting, in shafts, will vary from 5 for shafts of moderate depth, say 50 or 60 yd., to 8 or 10 for very deep shafts. In this case, assuming a factor of safety of 5, the safe working load of this rope, in a shaft 200 ft. deep, should not exceed 12 tons.

QUESTION—(a) What special care is required to be given to hoisting ropes and cages? (b) How would you determine whether a hoisting rope is unsafe and what portion of the rope would you consider the weakest part, or the part most liable to give out first?

ANSWER—(a) Hoisting ropes and cages must be carefully examined at the beginning and end of every shift, to make sure that they are in safe working condition. Special care must be taken not to overload the cage or to hoist at a speed exceeding the safe limit, which must be determined in accordance with the depth of the shaft and the kind of equipment. At regular brief intervals, it is necessary to examine with particular care the entire length of the hoisting rope by allowing it to pass through a bunch of waste held in the hand, as the cage is hoisted or lowered very slowly. The purpose is to detect any loose wires or broken strands and any undue amount of wear of the outer strands that would seriously affect the strength of the rope.

(b) That portion of the rope that may be considered the weakest part and more liable to fail is the lower end of the rope, within a few feet of the coupling of the cage, because this portion is often more subject to sharp bending and sudden jerks when the cage is first started off the bottom under a heavy load. Another portion of the rope that may be considered to develop weakness is that portion over the hoisting sheave, above the shaft, when the cage is on the bottom and started too suddenly, whereby a heavy bending strain is developed in the outer wires of the rope, above the sheave-wheel at the top of the headframe.

Power of Miners' Union Based on Violence, Says Brief of Utah Operators

Non-union coal operators of Utah, through counsel for the Bituminous Operators' Special Committee, submitted to the U. S. Coal Commission on June 28 a brief attacking the United Mine Workers of America, declaring that organization to be an impotent and unconvincing machine unless permitted to indulge in violence.

The brief contends that the sole purpose of the union in the campaign in Utah during the nation-wide strike of last year by representatives of the United Mine Workers was to prevent Utah coal reaching the public while the strike lasted and that in the campaign the union was trying only to strengthen its monopolistic grip on the country, and not at all to benefit the miners of Utah. To support this the brief gives a short description of similar campaigns in non-union fields all over the country which were carried on simultaneously with the attack on Utah.

In support of the former charge, the Utah brief cites numerous instances of assaults on loyal workers and even on disinterested citizens who were mistaken for strike breakers or company officials.

These attacks brought about the dispatch of troops to the affected district by order of the government. Firearms were taken from mine guards and strikers, it says, and law and order quickly restored. "With the establishment of law and order," the brief declares, "the attempt of the United Mine Workers to stop the production of coal in Utah completely failed.

"Deprived of the weapons of violence and intimidation, and compelled to obey the law, the invading agitators of the United Mine Workers of America were powerless to further disorganize the community. By lawful methods they could accomplish nothing. The result demonstrates with clearness that at least in the fields where living and working conditions are good the United Mine Workers of America, with the present high cost of its militant organization, requires the artificial support of the 'check-off' in its system of enforced taxation to keep its existence."

In closing the brief the operators submit a list of thirty-

five names of United Mine Workers of America who have been tried and convicted of violations of the law during the strike in Carbon County, Utah. Eight others are awaiting trial for similar offenses.

Coal-Mine Fatalities in May Decrease In Number and Ratio to Output

Fatal accidents at coal mines throughout the United States numbered 170 during May, 1923, according to reports received by the Bureau of Mines of the Department of the Interior from state mine inspectors. The production of coal during the month was 54,649,000 tons, hence the fatality rate was 3.11 per million tons. In May last year the fatality rate was 4.22 based upon an output of 20,636,000 tons, including 35,000 tons of anthracite. In April, 1923, the rate was 3.49. Because of the miners' suspension of work last year, the production of fresh-mined anthracite in May, 1922, was completely stopped; in May, 1923, the anthracite output was 8,573,000 tons. For bituminous mines alone, the fatality rate in May, 1923, was 2.67 per million tons as compared with 4.17 in May a year ago.

During the first five months of the present year the fatality rate for bituminous-coal mines was 3.55 per million tons, based on 809 deaths, as against a rate of 3.70 for the corresponding months last year, based on 611 deaths. The rate for 1923 represents a reduction of 4 per cent. For anthracite mines alone the five-month fatality rate for 1923 was 5.36 per million tons, based on 228 fatalities, as against a rate of 6.72 for the first five months of 1922 based on 147 fatalities. The rate for 1923 represents a reduction of 20 per cent.

The fatality rates per million tons for the principal causes of accidents during the first five months of 1922 and 1923 were:

	1922	1923
Falls of roof and coal.....	1.906	1.765
Haulage.....	0.819	0.603
Gas and dust explosions.....	0.551	0.670

Coal Retailers Urge Incorporation of Unions, Abolition Of Government Fuel Yards and Adoption of Net Ton

The National Retail Coal Merchants' Association, in annual convention at Scranton, June 25, 26 and 27, went on record as favoring incorporation of labor unions, abolition of government-owned fuel yards and advocating a uniform 2,000-lb. ton throughout the United States. The association expressed accord with, and in the purposes and confidence in the personnel of the U. S. Coal Commission and its intention to aid the commission in every possible way, and urged all retail coal merchants to furnish promptly the information requested by the commission's questionnaire.

Roderick Stephens, chairman of the Governmental Relations Committee, reported that the committee has good grounds to believe that Secretary of the Interior Work will recommend to Congress the passage of legislation to abolish the Government Fuel Yard.

Secretary O'Toole made public a letter he had sent to John Hays Hammond, chairman of the U. S. Coal Commission, in reply to a statement filed with the commission by the United Mine Workers of America in which it is alleged that "distributors are taking a profit on anthracite equal to that of the operators" and that "agreements (exist) among the retail coal dealers to dispose of anthracite at a uniform price."

"To support these allegations," says the letter, "the United Mine Workers quote selected self-serving extracts from various reports of different individuals and groups, and they append statistical tables prepared from unreliable or unknown sources, without authentication, and which, even if supported by reliable proof, are composed of facts covering so short a period, so limited a territory and so small a proportion of the retail tonnage in each section covered, as to constitute no adequate basis for any general conclusions.

"Therefore, placing full reliance upon your good judgment and sense of fair play, we shall rest our case so far as the charges contained in this document are concerned, without attempting to tabulate the mass of material we have collected from each of several cities referred to specifically, which if so presented would support our statements regarding the inaccuracy of the statistics furnished by the representatives of the miners' union."

In his report on the anthracite division of the Trade Relations Committee, Samuel B. Crowell, of Philadelphia, told of sending a letter to S. D. Warriner, chairman of the General Policies Committee of Anthracite Operators, asking for a conference at which government fuel yards, municipal fuel yards, legislation (particularly in Pennsylvania) regarding standards of preparation, publicity with particular reference to the use of buckwheat and smaller sizes and other matters should be discussed. The meeting was held and after an hour's discussion it was Mr. Warriner's opinion that owing to the unusual amount of time and energy which all branches of the industry were putting upon the questionnaires from the U. S. Coal Commission and the fact that until the final report was made by the commission, time was not opportune that the suggestions be acted upon. However, further conferences between the operating end of the anthracite industry and Mr. Crowell and members of his committee have been held and consideration given to some of the suggestions. The committee recommended to all coal dealers, particularly those doing business in the anthracite district, to individually help the sale of No. 1 buckwheat.

Marshall Keig, of Chicago, chairman of the bituminous coal committee, making a verbal report, appealed to producers to prepare their coal properly and escape criticism. It is the duty of producers and wholesale dealers to educate the public in the use of bituminous coal and he declared that the retail dealers would be glad to join them in the educational campaign.

Homer D. Jones, of Chicago, president of the Association, in his address delivered at the first session of the convention, told the members that the principles of the organization as

set forth in the Declaration of Principles are "truth, honesty, courteous service and fair dealing" and that any individual merchant or aggregation of merchants falling short of this measure is undesirable as a member of the organization. The retail dealer is as honest, dependable and law abiding as any other group of business or professional men, he declared, and it is safe to say that 95 per cent of them never have and never will commit any act or acts that are detrimental to the industry or to the coal-buying public.

Samuel B. Crowell, vice-president of the Newton Coal Co., Philadelphia, was unanimously elected president of the association to succeed Mr. Jones. Other officers and directors chosen were: Vice-presidents, Marshall Keig, Chicago, Ill.; William A. Clark, Northampton, Mass.; J. Maury Dove, Jr., Washington, D. C.; Ernest R. Sweeney, Kansas City, Mo.; Charles B. Staats, Albany, N. Y.; W. L. Vail, Toledo, Ohio; Resident Vice-president, Joseph E. O'Toole, Washington, D. C.; Treasurer, Richard J. Wulff, Brooklyn, N. Y.; Directors, Eli J. Barkume, Detroit, Mich.; Charles B. Bodwell, Manchester, N. H.; Joseph H. Lucking, Newark, N. J.; John S. McEwan, Albany, N. Y.; W. R. Fequay, St. Joseph, Mo.; J. Harry West, Baltimore, Md.; L. P. Coan, St. Louis, Mo.; Joseph Rademacher, Milwaukee, Wis.

The following evening the delegates and many operators and wholesale dealers were the guests of the Anthracite Producing & Sales Co. at a banquet at Irem Temple, Wilkes-Barre, the journey to that city being made in a special train over the Delaware & Hudson R.R. The Chicago delegation, wearing costumes of white capes and large straw hats with wide red bands, was headed by a band of music, while the delegation from Detroit was attired in blue overalls and straw hats. J. Hayden Oliver, general counsel, Glen Alden Coal Co., was the toastmaster.

Cadwallader Evans, Jr., consulting engineer, speaking on "Mining Anthracite" told the dealers that in his opinion there can be no reasonable expectation of a decrease in cost due to a reduced cost of labor except such as will come through a reduction in the wage scale, nor a reduction in cost due to easier mining conditions for these conditions, at least in the northern anthracite region, will grow more and more severe each year. The opening up of the virgin reserve tonnage of the larger companies in the southern anthracite region will no doubt replace the diminishing output from the northern fields as years go on, but with no decrease in cost.

Other speakers at the banquet were Charles Dorrance, Jr., vice-president, Hudson Coal Co., who spoke on the "Preparation of Anthracite," and Alan C. Dodson, president of Weston Dodson & Co., whose subject was "Sales and Distribution."

The last day of the convention was devoted to trips to various mines, the delegates leaving the Hotel Casey in nearly 100 automobiles and visiting the Marvine breaker of the Hudson Coal Co., the Baker breaker of the Glen Alden Coal Co., and the Lafin breaker of the Hudson Coal Co. Many of the visitors remained until later in the week and inspected the inside workings of the mines.

12,910,000 Barrels of Portland Cement Produced During May

Production of portland cement during May, 1923, according to the U. S. Geological Survey, totaled 12,910,000 barrels, compared with 11,176,000 barrels in the corresponding month of 1922 and 11,359,000 barrels in April, 1923. Shipments for the month were 14,257,000 barrels against 12,749,000 in May a year ago and 12,954,000 barrels in April, 1923. Stocks at the end of May were 10,115,000 barrels compared with 12,893,000 barrels at that period in 1922 and 11,463,000 barrels at the end of April, 1923.

Nationalization of Coal Mines Would Be Fatal Venture, Says Brydon

President Harding's stand against nationalization of coal mines, as expressed in his address at Cheyenne, Wyo., June 25, was declared today by John C. Brydon, president of the National Coal Association, to reflect the opinion of economists throughout the country, industrial experts who know that such nationalization would spell disaster for the consumer as well as the miner.

"The competition which now exists in the coal industry, particularly in the bituminous field," he said, "is an advantage to the public. If the government were to run the mines, a non-competitive condition would exist, resulting in inefficiency and consequent reaction against the consumer."

"Furthermore, it seems to me to be obvious that it would be utterly impracticable for the government to operate the mines even if constitutionally possible, either under a system of ownership or of direct control. Bituminous mines spread variously through thirty of the forty-eight states and anthracite mines run thickly in eastern Pennsylvania. There are approximately 7,000 individual coal producers or companies, with some 10,000 mines, engaged in the bituminous field alone. They employ more than 600,000 miners and their yearly output runs between 450,000,000 and 550,000,000 tons, according to the national demand. Approximately 200 operating companies are engaged in anthracite mines, which turn out from 90,000,000 to 100,000,000 tons a year and employ about 150,000 men."

President Brydon declared that federal ownership or control would destroy competition among these widely scattered mines and would throw upon the government the handling of intricate labor problems involving the fixing of wages. "And what is of great importance," he said, "the taking over of the mines by the government would involve a huge increase in the public debt at a time when the country is already under the burden of an unprecedented war debt. From every public viewpoint nationalization would be a fatal venture."

Massachusetts Attorney General Corrects Misunderstanding of Pure Coal Law

Enactment of the Massachusetts pure-coal law, drawn up to prevent the sale of fireproof coal in that state, is causing considerable apprehension to the coal trade there, it being asserted that it will materially curtail shipments of anthracite to the Bay State. For that reason Eugene Hultman, State Fuel Administrator, has asked Jay R. Benton, State Attorney General, to give an opinion on the provisions of the act and its workings. The Attorney General's reply, under date of June 14, is as follows in part:

"Sub-section 249A of the act provides, in substance, that the Department of Public Health, local boards of health, the Director of Standards and local sealers of weights and measures and their authorized agents may enter places where coal is stored or kept for sale and may inspect coal or take samples. Samples taken must be tested. If the coal is unfit for ordinary use it may be condemned, seized and destroyed, or otherwise disposed of than for ordinary use.

"This is the only section of the new law which relates to condemnation and seizure of coal. Because there has been some misunderstanding relative to the law I desire to call your attention to several important provisions.

"The only coal which may be condemned and seized is coal which is unfit for ordinary use. *This means coal which will not burn.* Coal which will burn may neither be condemned nor seized. Secondly, no coal may be condemned or seized except by the Department of Public Health, which is a state department, or with its approval. Local sealers of weights and measures may not under any circumstances condemn coal. Local boards of health may condemn coal *only* with the approval of the Department of Public Health. You will thus observe that the state department is the *only* authority which determines finally whether coal will not burn and whether it should be condemned. This means that

the same standard of unfitness is applied throughout the state through the medium of one central body, and that local influences or prejudices cannot enter into the determination of the question whether the coal will not burn and whether it should be condemned.

"The law is very similar to the so-called pure food law relative to the condemnation and seizure of meat, fish, vegetables, produce, fruit and provisions which are unfit for food, and which law has been in existence in Massachusetts for more than fifty years. Everyone now admits that the pure food law is an absolute necessity and that it works no hardship or inconvenience upon any honest or reputable dealer. The present coal law works in practically the same manner, except that coal may be condemned *only by one central authority*, the Department of Public Health.

"The law is designed to prevent coal which will not burn from being sold in this commonwealth. It has been in operation slightly less than three months and has amply demonstrated its efficacy in keeping non-burnable coal out of the consumers' hands. It has been administered in a reasonable and efficient manner, and with an increase in the force of the Department of Public Health, where all analyses of coal are made, the administration of the law will be still further expedited and much improved.

"No honest or reputable coal dealer or operator should have the slightest occasion to fear the working of the law or its effect upon his business or property. Dishonest dealers or operators who seek to fill the bins of the consumers with coal which will not burn will find that such coal will not be tolerated in Massachusetts."

Court Signs Reading Segregation Decree; Dissolution Ordered Within Six Months

Judges Buffington, Davis and Thompson, in the U. S. District Court at Philadelphia, signed the decree of the court segregating the Reading Company from the coal properties. The decree is based on the third modified plan submitted by the Reading Company, and orders the dissolution in six months from June 27.

The decree provides that after the new mortgages have been executed in place of the existing general mortgage, the tender of the new bonds in exchange for the present general mortgage bonds are to be held open for three months.

Although the decree is called a final decree, there may be further litigation in the case on a provision of the third modified plan increasing the interest on the new railway stock from 4 to 4½ per cent, and on the coal stock from 5 to 5½ per cent as a means of compensating the general mortgage bondholders for financial losses which will ensue from a separation of their security by the segregation.

Segregation of the Reading Company and its underlying railroad and coal companies from each other was ordered by the U. S. Supreme Court in 1920.

Utilities Consume 2,980,425 Tons of Coal In April; Power Production Declines

Electric public-utility plants consumed 2,980,425 net tons of coal during April, according to a report just issued by the U. S. Geological Survey. This compares with 3,351,462 tons consumed during March, according to corrected returns.

Fuel oil consumed by public-utility plants in April totaled 1,006,423 barrels, compared with 1,166,148 barrels in March. The average daily production of electricity by public-utility power plants during April was 149,300,000 kw.-hr., or 2 per cent less than the average daily output in March and about 3 per cent less than the record-breaking rate of February.

The average daily production of electricity for the first four months of 1923 and the proportion produced by water power were as follows: January, 153,300,000 kw.-hr., 34 per cent; February, 154,400,000 kw.-hr., 33.9 per cent; March, 152,500,000 kw.-hr., 36.3 per cent, and April, 149,300,000 kw.-hr., 39.8 per cent. The increase in the amount of water available for the use of hydro-electric power plants and the increase in the capacity of water-power plants is reflected in the increase in the proportion of the total amount of electricity produced by the use of water power.

Famous 226 Indictments Dismissed but Profiteering Case Against 125 Coal Men Is Continued

Criminal indictments against 226 coal operators, union officials, miners and coal corporations were dismissed in federal court in Indianapolis June 28 on motion of Harry M. Daugherty, U. S. Attorney General. The cases had been pending since the return of indictments by a federal grand jury Feb. 25, 1921. Charges that operators and miners had combined to control the soft-coal industry of the country in violation of the Sherman anti-trust law were contained in the indictments. Belief that a conviction could not be obtained was the basis of the motion to dismiss the cases, according to a lengthy statement read by Mr. Daugherty to Judge Albert B. Anderson.

However, indictments against 125 operators and union officials returned in 1920 under the Lever Act to prevent profiteering, remained on the court docket. The 125 defendants, practically all of whom were numbered among the 226 now relieved of the Sherman law indictments, are free on their own recognizance. The profiteering case is "indefinitely postponed." Attorney General Daugherty said he would take no action in this case "for some time."

The Attorney General said in his statement before moving dismissal of the 226 Sherman Act indictments that many things done at joint meetings of operators and miners constituted a conspiracy. Such practices will not be permitted by the government in the future, he said. In making the motion to dismiss, he said one of the reasons was to make it impossible to say that the legal branch of the government was unnecessarily impeding the progress of legitimate business.

GOVERNMENT TO ATTEND MORE TO PUBLIC'S RIGHTS

At the same time he denied that the government was taking a backward step in enforcing the Sherman Act. In the future, he said, the government would give more attention to the rights of the general public. He said many of the acts complained of in the indictments were to some extent due to the efforts of government officials during the war to bring about co-operation between coal miners, operators and the railroads to stimulate coal production.

At the conclusion of Mr. Daugherty's statement Judge Anderson granted the motion and ordered the cases *nolle prossed*. He made no comments and adjourned court immediately. The grand jury investigation which resulted in the indictments two and a half years ago was instituted on instructions from Judge Anderson.

Following the reading of the Attorney General's statement, Indianapolis lawyers who attended the hearing, June 28, said Mr. Daugherty said he believed miners and operators had been guilty of entering into illegal agreements and performing illegal acts, but that the best thing to do was to wipe the slate clean and begin over again.

Some paragraphs were particularly pertinent. One passage follows: "I have no hesitation in saying that usually many of the things agreed upon at the meetings between the representatives of the operators and representatives of the miners, but not often made public, constitute a conspiracy. The public is fed up with the idea that there is a great and stubborn controversy between the contracting parties, when in fact there is no real contest at all and the fake pretensions are intended only to alarm the public so that it will consent to give any price for coal in order to be insured against freezing.

"The intelligent people of this country have grown impatient with the constant quarrel—sometimes only a pretended quarrel—between operator and miner spokesmen, which takes place every few years and lately more frequently, resulting in great losses to industry and great losses to the workingman, to say nothing of the great hardships to everybody. Hereafter the government will give more attention than it has heretofore to the rights of those who suffer the greatest loss by reason of those unlawful acts and who are entitled to the first consideration.

"We may say, avoiding the burden of too much detail, that the government cannot deny in this case that the collective bargaining between the operators and miners, scales committees, the commonly called check-off system and the distribution of statistics, each set forth in the indictment as a means for the accomplishment of the unlawful conspiracies charged, were well known to the then responsible government officials and that to say the least, such acts were permitted by such government officials without protest.

"I believe the acts complained of were unlawful. I have, however, reached the conclusion that the evidence which the defendants would be able to submit to the jury is more or less convincing on the question of intent, and is more than necessary to create a reasonable doubt of guilt. That being so, I believe a verdict of not guilty would be the inevitable result of the trial of this case. I am, therefore, convinced it is my duty to enter a *nolle prosequi* in this case."

Institute to Discuss Inspection Problems

The program for the meeting of the Mine Inspectors' Institute of America to be held in Pittsburg, Kan., July 10, 11 and 12 will be devoted largely to sessions in which inspection problems will be discussed, but provision also has been made for entertainment features, including a banquet and a tour of the Pittsburg mining district.

The principal discussion topics and the leaders are as follows:

"Electric Machinery in Gaseous Mines and Its Limitation for Safety," James Dalrymple, chief inspector, Colorado.

"How to Recognize a Dusty Mine from the Standpoint of Danger," Robert Medill, chief of Department of Mines and Minerals, Illinois.

"Should the Use of Black Blasting Powder Be Prohibited in All Bituminous Mines?" Lawson Blenkinsopp, chief inspector of mines, Kentucky.

"What Can Be Done to Reduce Accidents from Falls of Roof, (a) by additional legislation; (b) by the operator; (c) by the miner; (d) by the state inspector," J. J. Walsh, chief of Department of Mines, Pennsylvania.

"Is Compensation an Aid in Reducing Mine Accidents?" Jerome Watson, chief of Division of Mines, Ohio.

"What Reduction in Accidents Has Resulted from Safety Organizations Conducted by the Operator and What Are the Main Features of Any That Have Proven of Benefit?" Robert Lambie, chief of Department of Mines, West Virginia.

"Is It Practicable to Frame a Basic Mine Law Suitable for All Bituminous Mine Conditions as a Model for Promotion of Uniformity in State Laws as They Relate to Accident Prevention and General Safety?" James Sherwood, chief mine inspector, Kansas.

"In What Manner Can the Federal Bureau of Mines Be of Greatest Assistance to the State Mine Inspectors?" Dr. J. J. Rutledge, chief of Bureau of Mines, Maryland.

Drop Burns Reorganization Plan

The officers and board of directors of Burns Bros., New York, have abandoned the proposed plan of readjustment of the capital structure of the company and the merger of the property with the National Coal Corporation. The plan was proposed by the Board of Directors and recently submitted to stockholders, the latter having voted their approval at a meeting held earlier in the month. M. F. Burns, president of the Burns Bros. organization, declined to comment on the matter. Consequently an official reason for dropping the plan is lacking, but according to reports in the New York financial district the recent sharp decline in the stocks of the company greatly upset the program which officials had in mind.

Must Keep Mines Working in Solving Hard Coal Problem, Say Operators

Declaring that the public will be satisfied with no solution of the anthracite question that does not insure uninterrupted operation of the mines, the anthracite operators through their counsel, Walter Gordon Merritt, submitted recommendations looking toward that end in a statement to the U. S. Coal Commission on June 4, just made public. "Were the diagnosis of the labor situation similar to that of other industries," says Mr. Merritt, "we would not urge remedies which look to any power or agency beyond the control of the parties directly interested but would place our confidence in the wish of these parties to work out some voluntary plan of co-operation. . . . The unfortunate experience of the immediate past, however, and an analysis of the reasons for this failure of existing arrangements demonstrate that the present psychological background requires some more authoritative remedy to restrain the disorders which we have portrayed."

Mr. Merritt then reviews the proposals to avoid general suspension on the termination of agreements, discussing in turn compulsory arbitration, prohibition of strikes and lockouts except where an offer of arbitration has been made and rejected, compulsory investigation with prohibition of strikes and lockouts pending investigation, as illustrated by the Canadian Industrial Disputes Act and the Colorado Industrial Commission Act, and concludes by saying that if none of these is adopted all strikes should be unlawful except when authorized by a two-thirds secret vote and that the anthracite industry should be kept independent of the bituminous-coal industry.

The fundamental defect in the present system, according to Mr. Merritt, is not the character of the agencies for settling disputes but lack of definite authoritative remedy to enforce the submission and collection of damages or indemnity. "Under prevailing conditions in the anthracite industry," he says, "no form of industrial government, however Utopian, will be of avail unless this defect is overcome." The operator, he states, is without the requisite authority to correct these conditions, for he may not join with his associates in declaring a sympathetic lockout as in the building trades, for the public must have coal. Mr. Merritt does not think that the remedy for this condition can be found within the miners' organization, the control of which is today deteriorating.

The remedy, Mr. Merritt concludes, must be supplied by the government in behalf of the public, and he recommends to this end legislation the essentials of which should be as follows:

"(1) It shall be the duty of the government (state or national, as the case may be) to collect for the public treasury from the district union having jurisdiction of the union men where an unlawful strike takes place \$1 per day per man for every day each union man is engaged in such strike.

"(2) It shall be the duty of the government to collect for the public treasury from any operator or operators engaging in a wrongful lockout \$1 per day per man for every day each person is so unlawfully locked out.

"(3) If the government should fail on request promptly to commence proceedings for the collection of such indemnity, any person, association or corporation may commence such suit, and after deduction of reasonable disbursements, including attorney's fees fixed by the court, shall pay over the balance to the public treasury.

"(4) The pendency of a private suit under the last paragraph shall not prevent the government from subsequently prosecuting a similar suit in its own behalf, and either or both sides may be prosecuted to a conclusion, provided that more than one indemnity shall not be collected.

"(5) In the event that the district union is obliged to pay such damages on account of the action of any local union or group of men belonging to any local, the district may in its discretion reimburse itself by collecting all or any part of said damages from the local union having jurisdiction of the men engaging in such unlawful strike.

"(6) The remedy prescribed in the proposed law should not be construed as an exclusive remedy to the derogation of any other remedy which any of the parties involved might otherwise have against each other."

Government Moves to Divorce Railroads From Ownership of Coal Lands

Before the U. S. Court of Appeals in Cincinnati on June 8 litigation begun by the Attorney General of the United States in 1911 to force the Lake Shore & Michigan Southern as well as other railroads to divorce themselves from all ownership interest in coal lands and especially those lying in the Hocking field in Ohio, which is alleged to be in violation of the Sherman Anti-Trust act, was renewed by Benson Hough, U. S. Attorney for the southern Ohio district, and a great array of legal talent.

The original case was heard by Judges Kappen, Warrington and Denison in the federal court at Grand Rapids. Judge Warrington has since died, so the case went before the other two and Judge A. M. J. Cochran of the northern Kentucky district.

In December, 1912, the court ordered the Hocking Valley and other railroads which were involved to dispose of the coal lands and a decree in this case was entered on March 14, 1914, confirming the sale of lands known as the Sunday Creek Coal Co. to John S. Jones, of Granville, Ohio, for \$50,000 and the assumption of a \$4,000,000 mortgage held by the railway companies.

Another decree was entered on Nov. 11, 1916, confirming the sale of the Buckeye Coal & Railway Co. to Mr. Jones for \$450,000. It developed that the Hocking Valley R.R. has a mortgage for \$20,000,000 on its property to protect its bondholders and that the mortgage contained a clause providing for the payment of 2c. a ton royalty on all of the lump coal taken from the mines.

The new litigation that was argued on this occasion was partly an action on the part of the government to force the Hocking Valley R.R. to get rid of this royalty connecting it with the coal companies, on the ground that it might be a temptation on the part of the road to give preference to the coal company in transportation facilities. In addition Mr. Jones as the owner of the Buckeye Coal Co. filed an intervening petition asking that the royalty provision be cancelled as illegal.

Attorney Charles Van Brunt, of New York, acting as counsel for the Central Trust Co. of that city, holder of the \$20,000,000 mortgage, contended that the royalty is valid and that it has so been held by the Common Pleas Court and Court of Appeals of Perry County, Ohio, and that this was due to be paid to the trust company. This royalty amounts to \$75,000 already and its total is estimated to run to \$400,000 on all the coal lands.

Attorneys John P. Wilson, of Columbus, and Lawrence Maxwell, of Cincinnati, represented the Hocking Valley R.R. and also contended that the royalty clause was valid and that this road was negotiating a \$50,000,000 mortgage to take up the \$20,000,000 mortgage and care for other debts.

After hearing all argument the judges took the case under advisement.

Commission Issues Consumers' Price Guide

With the idea that domestic consumers can determine for themselves whether or not they are being charged excessive prices for anthracite, the U. S. Coal Commission is issuing statements showing the cost of stove anthracite on dealers' sidings.

The first of these statements covers various towns in the New England states and shows by towns the mine price and the freight on stove anthracite for the last shipment received prior to May 15, 1923, as reported to the Coal Commission by the retail coal dealers.

The information is intended for local consumption and is a guide to the consumer to indicate whether he is paying a reasonable price for his coal.

What the Interstate Commerce Commission Decided

That assigned cars and private cars are not prohibited by the Transportation Act.

That, nevertheless, the practice of assigning cars, private or system, is unjust, unreasonable, unduly and unreasonably preferential to mines receiving the cars and unjustly discriminatory against and unduly prejudicial to mines not receiving them.

That after Sept. 1 all cars, including private cars, must be distributed on a pro-rata basis and that all cars placed must be counted against the mine's allotment.

That hereafter the Interstate Commerce Commission will assign cars to particular mines under its emergency powers as necessity arises.

The decision, by including private cars, is a complete victory for the Central Pennsylvania Coal Operators. The National Coal Association did not attack private cars.

The private coal-car owners are expected to seek an injunction to stay the commission from depreciating their investment by this ruling.

Seven of the Commissioners signed the decision; four—Hall, Daniels, Potter and Cox—dissented.

Important Step Toward Stabilization of Coal Industry Seen in Abolition of Assigned-Car Practice

The most important single step toward stabilization in the coal industry was taken when the Interstate Commerce Commission abolished the railroad practice of assigning cars. This seems to be the opinion of the great majority of coal producers. It is pointed out, however, that the retention of this great advantage is dependent upon the attitude of the coal producers themselves. If advantage is taken of the situation to exact unreasonable prices from the railroads or if the railroads should be able to demonstrate that they cannot fuel themselves properly without assigned cars, as they have contended, the same body which has issued this order has the power to undo it. This victory for the coal operators was attained on a seven to four decision. Should two members of the commission become convinced that this order was not working properly, revocation doubtless would be prompt.

There is no reason, however, to believe that the coal-producing industry is so lacking in vision as to attempt to gouge the railroads. From Sept. 1, the effective date of the order, the practice of buying coal with cars will cease. Cars, private and otherwise, must be counted against the distributive share of each mine. It is just possible that the private-car interests can delay the effective date by obtaining an injunction, but it is believed that the chance is small of obtaining an injunction which would endure during the life of the litigation which it is reasonably certain the private-car owners will bring. It is thought unlikely that the railroads will take the case to the courts.

Commissioners Hall and Daniels, in their dissenting opinions, simply argued the legal and technical points involved. It remained for Commissioner Potter, however, to go outside of the record and assail the coal industry in what is regarded by many as being partly gratuitous.

The commission has attached significance to the fact that the Pennsylvania, the New York Central, the Louisville & Nashville and other important carriers did not present during the consideration of the case any statement of the reason which have impelled them to adopt and maintain the practice of assigning cars. Very apparently the commission attaches much importance to the fact that a large number of carriers provide themselves with fuel without resort to this practice, as space is taken in the opinion to present in tabular form the names of those companies.

Heretofore the commission has clung tenaciously to its decisions in the Hocking Valley and Traer cases, in which the assigned-car practice was upheld. In this decision, however, it is frank to say that "the rule evolved in the early decisions was not the fruition of right experience." The commission does not hesitate to call attention to Commissioner Lane's statement in 1910 that the distribution of cars to coal mines was based largely upon interest, prejudice and pull.

While the majority of the commission held that the assign-

ing of cars does not contravene the Interstate Commerce Act, Commissioner Eastman is convinced that it does. "I am unable to escape the conclusion," he says in his concurring opinion, "that it was the intent and is the meaning of the law that in times of car shortage every mine should be limited to a pro-rata share of the available car supply and that in computing this share every car furnished to the mine, whether private car or railroad-fuel car, or car for commercial loading, should be counted. Under the assigned-car practice now in effect, however, it appears that the number of such cars placed at a mine may, and often does, exceed its pro-rata share of the available car supply. It does not seem to me that in such cases the cars are being counted 'against' the mine. The purpose, as stated by the House Committee, when the bill was reported, was to avoid 'any possibility of the recurrence of the evil of what is known as assigned cars.'"

Commissioner Potter thinks "assigned and private cars perform essential functions which cannot be accomplished without them. Next to labor, coal costs are the highest item of operating expense. No agency should leave undone anything within the legitimate exercise of its powers to bring about a reduction of coal prices. From every quarter there is demand upon the carriers for increased efficiency and reduced operating costs. At such a time we, the guardians of public and carrier interest, are compelling the carriers against their will to adopt practices which will impair efficiency and increase costs."

At another point in his opinion Commissioner Potter declares that "it is well known that mines assured of continuous operation favorable for low-production costs will contract at lower prices. Opponents of assigned and private cars object to that desirable result. In order to maintain unhealthy and uneconomic conditions in the coal industry they contend that they should have a part of the order of the buying roads at high prices, although the interests of the general shipping public, which pays the carriers' coal bill, requires low fuel prices. The opponents of the private and assigned car demand that the interest of the many be sacrificed for the interest of the few, and we have sustained them."

"No industry that tolerates unnecessary expense should expect to prosper," continues Commissioner Potter, "and the coal industry could not survive if it were not able to pass on to consumers the consequences of the industry's mismanagement. The industry should clean house. Many want to clean house. They cannot do it alone. We have the power to assist the worthy and compel the unworthy through revision of the rate structure and the extended use of assigned and private cars. We should do what the consumers' interests require and almost, it might be said, forget the producer. We should construe the law as directing us to

require the use of equipment as public interest demands to serve best the fuel need."

In the opinion of some the decision bears unmistakable evidence of having been rendered with an eye to the well-being of the coal industry. Some regard it as catering to mine labor.

Illinois Sees Good and Evil in Ruling

Wide divergence of opinion among Illinois coal operators greeted the decision of the Interstate Commerce Commission against the assigned-car rule. At first flush and before any of them had had a chance to read the decision in full, one group thought the decision had no teeth because the commission still has power to issue special rulings creating preferential car distribution whenever an emergency arises, thus practically nullifying the force of the new order of things. Another group felt that the decision would be of real effect in the Middle West only if it prevented railroads from giving car preference to their own mines on their own lines—a point that was not clear in the first news of the decision. The third group felt that the decision is a fine and constructive piece of work by the commission which is bound to help remedy the evils of the coal industry.

There is in the Middle West, however, a small group of operators who find themselves in a position different from the rest. They are the ones with long railroad contracts whose prices were fixed on an assigned-car basis.

"I approve of the abolition of the assignment of cars," said one of that small group, "but what effect is it going to have on our long-term contracts with railroads? The price was set low because we were to be guaranteed plenty of cars and steady running time. The question is, will car supply be so poor at times under the new decision that our running time will be knocked flat and our costs mount to a point where we will be giving away our coal? That's something to worry about, but the only thing we can do is just wait and see what happens."

The jobbers are the class that is consistently happy over the decision. Almost to a man they feel they are going to do more business this year than they ever do normally. They expect to see the percentage of coal traded on the spot market mount from 25 to 50 per cent during the next eight months.

Midwest railroaders still confess to many puzzlements and a great degree of dissatisfaction over the decision. They are certain to try to prevent the decision from becoming operative by applying for an injunction before Sept. 1. The railroad meeting in Washington July 10, where the legal talent of the carriers will assemble, is expected to produce some course of action for the lines to follow.

"Of course," said the vice-president of one of the biggest coal carriers in the country, "if this is going to prevent us from getting coal from our own mines, there's bound to be trouble. That certainly would be unwarranted interference with the rights of a railroad and would interfere with our giving the public and the coal producers the best service of which we are capable."

The railroads will claim that there is no essential difference between railroad coal in railroad-owned mines and railroad coal now in storage along the lines. They say that if carriers cannot give their own mines a full and free car supply, then, by the same sign, they cannot use their cars for unhampered movement of their storage coal from stockpile to point of consumption, and that surely the Interstate Commerce Commission is not empowered to regulate car supply to storage piles.

A high official of a Western line thinks that the I.C.C. can hardly restrict the movement of private cars, while Chicago coal companies owning no private cars say that if private cars run unrestricted, then there is no point whatever to the decision.

"Wouldn't it be foolish," queries this rail official, "if the commission said to my line: 'You can't move but 50 cars to day from a certain mine when that mine has 100 cars of its own standing right at the tippie? There would be the extra 50 cars ready to load; there would be the mine ready to load them; there would be our railroad able and willing to move the whole 100; but nothing could be done simply because there were not railroad cars enough to give

other mines in the same neighborhood also 100 cars that day. Seems to me the commission will modify its decision."

It is generally conceded among Chicago railroaders that railroads will be forced into greater storage this summer if the commission's decision actually covers car supply to railroad-owned mines. Up to the end of the week there was no change of plan on the part of railroads, because of the uncertainty in the situation. Only a few lines, such as the Illinois Central, the Burlington, the Wabash and the Big Four are storing. They may enlarge their storage and roads that had decided they couldn't afford to store may go in for a few hundred thousand tons. This remains to be developed in the next week or so.

Canada Has No Fear of U. S. Prohibiting Export of Coal to Canada

A special committee of the Canadian Senate, appointed to deal with the question of the fuel supply of Canada, in its final report declared that there is little danger that the United States would prohibit the export of coal to Canada.

"There is an abundance of evidence to the effect that the coal areas of Canada, east and west, are sufficient to supply the fuel needs of our entire population for an indefinite period of time," says the report. "A large percentage of the collieries now in operation—more particularly those in western Canada—are capable of increasing their output to a very considerable extent with little or no capital cost, and would undoubtedly do so if markets for their increased output were available.

"Within recent months the coal operators and transportation interests of Canada have been giving a good deal of consideration to the question of reducing freight rates, the desirability of providing further and better facilities for handling and storing coals, and the necessity of educating the public to use Canadian coal.

"As regards the duty of the state as represented by federal, provincial and municipal governments," the committee has no hesitation in recommending "that every possible effort be made by those in authority to encourage the public to obtain their supplies of coal or other fuel from Canadian sources. The fact that we imported for consumption last year 13,017,025 tons of coal at an approximate cost of \$61,112,428 from the United States and other countries should impress everybody with the necessity of utilizing our own fuel resources to the fullest extent."

An exhaustive examination was made of the possibilities of coke. "As every ton of such coke when made from Canadian coal, lessens our dependence on anthracite, we are hopeful that this process will be further utilized in Canada," is the conclusion of the committee.

New England Retail Coal Dealers Report on Labor Conditions

The New England Coal Dealers' Association has issued an interesting condensed report on labor conditions, obtained from information sent in by about 250 members. A digest of the facts with respect to wages and hours is:

Maine, 14 communities reporting—Eight-hour day in three; nine-hour day in ten; ten-hour day in one. Teamsters get from \$18 to \$24 per week; chauffeurs, \$21 to \$30; helpers, \$18 to \$24.

New Hampshire, 15 communities reporting—Eight-hour day in one; nine-hour day in ten; ten-hour day in one; varying hours for different firms in three towns. Teamsters get from \$18 to \$30, the latter being one exceptional case where the firm has double teams; chauffeurs, \$21 to \$31.50; helpers, \$18 to \$24.

Vermont, 11 communities reporting—Nine-hour day in ten; trucking contract in the other. Teamsters, \$18 to \$25.50; chauffeurs, \$18 to \$30; helpers, \$16 to \$21.

Massachusetts, 74 communities reporting—Ten-hour day in one; nine-hour day in fifty-five; eight-hour day in twelve; varying hours in other towns. Teamsters, \$17 to \$32; chauffeurs, \$21 to \$33; helpers, \$17 to \$20.

Anthracite Miners Demand 20-per Cent Wage Increase, Two-Year Contract and Full Union Recognition

High Lights in the Tri-District Convention

Spurred on by John L. Lewis, the convention threw three alleged Communists into the street, thereby vindicating the conservative character of the miners' union.

Voted 11 demands, including 20 per cent increase to tonnage men and 33 per cent to day workers and a series of others, all rejected in 1920 by the Thompson Commission.

Left their scale committee free to negotiate with operators but bound them to refer agreement back to vote of membership or to a reconvened Tri-district convention, thereby meeting specific request of U. S. Coal Commission.

Passed no strike vote, leaving the way clear for peaceful settlement.

Gave Lewis as good a "hand" as it gave Capellini, president elect of District No. 1 and reputed radical.

An increase of 20 per cent in contract wages, a \$2 daily increase for day laborers, uniformity and equalization of all day rates, a uniform eight-hour day and the weighing of coal in computing pay are some of the demands adopted by the anthracite mine workers at the convention held in Scranton June 26 to 29. These demands will be presented to the anthracite operators as soon after July 4 as possible, according to John L. Lewis, International president of the United Mine Workers of America, who presided over the convention the last two days.

The meeting was composed of over 500 delegates representing the workers in Districts 1, 7 and 9 and was held in Town Hall, the demands being adopted at the afternoon session of June 29.

The morning session of June 29 was enlivened by the presence of two men and a woman, alleged Communists. They were ordered to leave the hall and later were attacked and beaten in the Court House Square.

No action was taken regarding the continuation of work after Aug. 31, when the present agreement expires.

"The United Mine Workers of America are not approaching the coming negotiations with the anthracite operators in a spirit of apprehension," declared President John L. Lewis, at his first appearance on the convention floor on June 29. "We are not approaching those wage negotiations with any desire to bring about a suspension of coal production in the anthracite fields. None more than we appreciate the many grave responsibilities which will devolve upon the shoulders of the representatives of the Mine Workers and the operators in the conferences to come, and none more than we recognize the paramount interest of the American people in having effectuated, if possible, a satisfactory wage adjustment in order that these mines may continue to produce coal uninterruptedly."

Concluding, Mr. Lewis said: "The President of the United States last week addressed a letter to the U. S. Coal Commission bearing upon the anthracite situation and asking the Coal Commission to exercise its good offices in expediting matters. There can be no criticism of the President's action in the premises. He was merely articulating a point of view held by a great many people who suffered great inconvenience during the year past."

"The U. S. Coal Commission since the receipt of the letter from the President have addressed a communication through its chairman to Chairman Kennedy of the Tri-District convention. The letter has arrived this morning and I think it opportune at this moment, in closing my remarks, to call upon President Kennedy to read to the convention the letter of the Coal Commission and have it spread upon our records."

The letter from Mr. Hammond follows:

"On Jan. 11, pending negotiations between the operators and the bituminous miners on a new contract, this commission approached both sides, urging an agreement that would continue mining operations. It received assurances of support from both sides to the suggestion that by mutual co-operation an understanding should be reached that would protect the interest of each and at the same time save the public from the disaster of a suspension of mine operations."

"We now address you in the same spirit as regards the

necessity for the same co-operation in the settlement of the details of a new contract in the anthracite fields, the present contract expiring Aug. 31.

"This commission hopes that the prompt and satisfactory response received to its suggestions in the matter of the bituminous contract will be repeated in the negotiations about to be undertaken in the making of an anthracite contract. The public expects an agreement, and we have full confidence that both operators and miners will recognize their duty to the public and will be able to effect a speedy conclusion."

"You will receive within a few days the commission's report upon the anthracite industry. In the meantime we urge upon both sides that, in addition to the welfare of each, that of the great body politic of the American people is involved, and that public sentiment will not tolerate a suspension of its anthracite coal supply with the beginning of the fall and winter season."

"As the present contract provides 'the continuance of production after Aug. 31, 1923, shall be upon such terms as the parties may agree upon in the light of the report of the commission,' the commission confidently expects that all questions will be left open for consideration of the Joint Scale Committee."

NOTABLE ATTENDANCE OF YOUNG MEN

The convention opened on the morning of June 26 and Thomas Kennedy, president of District No. 7, was chosen temporary chairman. A noticeable feature was the presence among the 500 delegates of a large number of young men, which was generally commented on. Heretofore the majority of delegates have been men of middle age.

Mayor John H. Durkan welcomed the delegates. An effort was made early in the meeting to have Rinaldo Capellini, according to the unofficial returns the newly elected president of District No. 1, address the convention. Chairman Kennedy overruled the motion at that time but later in the day Mr. Capellini made a speech in which he said he stood for 100 per cent unity, 100 per cent effort to obtain better wages and 100 per cent brotherliness and love.

During the first day's sessions Chairman Kennedy appointed the scale committee, the committee on resolutions and the committee on rules. Capellini made a request that inasmuch as the newly elected officers of District No. 1 would be in office after the new wage agreement had been signed it would only be fair to allow them to sit in while the conference committee discussed the demands to be presented. Late on June 29 President Lewis announced that Capellini would be on the sub-committee that will confer with the operators.

At the session on June 27 Chairman Kennedy took up the cudgel against the National Retail Coal Merchants' Association, which on the day previous had adopted a resolution urging the incorporation of all labor unions, although the resolution did not name the mine workers' organization. He declared it as the unseen hand of the anthracite operators hitting at the mine workers. Mr. Kennedy said the United Mine Workers of America is not dealing in commodities, it is not a business organization for profit and that therefore there is no necessity for incorporation.

The convention referred to President Lewis a resolution that the United Mine Workers enter into an agreement with miners of foreign countries by the terms of which a coal supply would be shut off from America in case of a miners' strike. A resolution that the convention approve the John Mitchell Insurance Co., an organization about to be formed to supply insurance to mine workers at a reduced premium, was adopted. It was explained that the company was in no way affiliated with the miners' organization and that it will be a private enterprise catering to miners.

The demands which were adopted by the convention follow in full:

(1) That the next contract be for a period of two years with complete recognition of the United Mine Workers of America, Districts 1, 7 and 9.

(2) That the contract wage scales shall be increased 20 per cent; all day men shall be granted an increase of \$2 per day; that the contract laborers increase now being paid by the operators shall be added to the contract rates; that the differential in cents per day between classifications of labor previous to the award of the U. S. Anthracite Coal Commission shall be restored.

(3) Uniformity and equalization of all day rates and that skilled mechanics, such as carpenters, blacksmiths, etc., shall be paid the recognized standard rates existing in the region, which rates should not be less than 90c. per hour as a basis and that engineers and pumpmen who do repair work on their engines and pumps shall be paid the mechanics' rate quoted herein for this repair work; and that all day men shall be paid time and one-half for over time and double time for Sundays and holidays.

(4) That the provisions of the eight-hour clause in the present agreement shall be applied to all persons working in or around the anthracite collieries coming under the jurisdiction of the U. M. W. of A., regardless of occupations, and that in the bringing of these employees under the eight-hour day their basis shall be arrived at in the same manner as the basis was arrived at in the case of pumpmen and engineers, plus the increase demanded in Sec. 2 of this document; and further, that inside day labor shall work on the basis of straight eight hours underground.

(5) That where coal is paid for by the car it shall be changed and payment shall be made on the ton basis of 2240 lb. where dockage and penalties are now imposed for refuse, that the amount of such refuse to be permitted in any car shall be fixed by the mine committee and colliery officials in conformity with the agreement and that the present unreasonable penalties and dockage shall be abolished.

(6) A more liberal and satisfactory clause in the agreement covering the question of miners who encounter abnormal conditions in their working places, and that to correct this situation the following quotation: "Unless otherwise directed by the foreman." shall be stricken from the agreement covering this particular subject and that the consideration rate of each colliery should be equivalent to the average daily earnings of contract miners under

normal conditions and that for dead work performed by the contract miner he shall be paid this consideration rate.

(7) Payment for all sheet iron, props, timber, forepolling, extra and abnormal shoveling, where such is not now paid for, and that jackhammers shall be supplied to miners free of charge and that company workers shall be supplied with tools free of charge.

(8) That a uniform rate of 20c. per inch be paid for refuse in all kinds of mining up to ten feet wide, and that the rate for blasting top and bottom rock shall not be less than 30c. per inch with the understanding that there rates are to be the minimum, not affecting higher rates that exist.

(9) That after a grievance has been disposed of by the Conciliation Board and referred to the umpire that the umpire shall likewise render his decision within thirty days, said decision to be based upon equity if requested by complainant.

(10) That the wage schedules be brought up to date, containing all new rates and occupations, and that mine committees shall be authorized to meet with company officials and agree upon rates for new work, before such work is commenced, and that such rates shall be added to the rate sheet and complete copies shall be supplied the committees and filed with the Board of Conciliation. The foregoing section to likewise apply to new rates for pillar work.

(11) That employees of stripping contractors be brought under the general agreement on their present basis of wages plus the increase demanded herein and that stripping locomotive engineers shall receive a rate equal to that of the shovel cranimen with extra payment for looking after their engines previous to starting time, at noon time and after quitting time; and that the shovels and boilers to be assigned watchmen shall be restricted to a certain number to be determined upon between the contractors and the committee.

We recommend that our Scale Committee use every effort to have the operators agree to some provision in the agreement regarding the price of coal and rent to be charged the employees.

Supplementary Recommendations on Policy.—The committee recommends that the scale committee to negotiate the contract shall be composed of the officers, the Executive Board members of the three districts, together with the resident International officers and three mine workers from each district affected, the district presidents to select the three mine workers in each district subject to the approval of the Executive Boards. We further recommend that this committee shall decide as to whether the report shall be submitted to the rank and file by referendum vote or to a tri-district convention, with the further understanding that copies of the report of the scale committee shall be forwarded to all local unions in sufficient time for their information, previous to the referendum vote or the convention. We further recommend that the unofficially elected new officers in District 1 shall be permitted to become members of the scale committee from the start of the negotiations, subject to approval of the regular biennial convention of District 1. This recommendation is made without prejudice to any controversy that might arise concerning the election for officers of District 1.

Wage Parley at Atlantic City, July 6

Officials of the United Mine Workers will present to mine owners at Atlantic City, July 6, the demand for anthracite wage increases drawn up by the workers at Scranton, Pa., last week. Besides John L. Lewis, president, and other officials of the International union, the sessions will be attended by the three presidents of the anthracite district and most of the Miners' Scale Committee. S. D. Warriner of Philadelphia, is expected to head a delegation of eight of the principal coal producers.

Army Seeks Coal Bids for Midwest Posts

The Quartermaster Corps of the army has called for bids on coal for various government posts to be opened at the Chicago Depot, July 17, at 11 a.m., as follows: Fort Benjamin Harrison, Indiana, 8,000 tons; Fort Brady, Michigan, 1,650 tons; Chanute Field, Illinois, 2,100 tons; Fort Cook, Nebraska, 3,150 tons; Fort Wayne, Michigan, 1,200 tons; Camp Custer, Michigan, 1,200 tons; Fort Des Moines, Iowa, 4,800 tons; Erie Proving Grounds, Ohio, 1,250 tons; Fairfield Air Depot, Ohio, 4,600 tons; Fort Hayes, Ohio, 3,700 tons; Jefferson Barracks, Missouri, 5,500 tons; Fort Leavenworth, Kansas, 35,000 tons; Camp Knox, Kentucky, 1,000 tons; Little Rock Depot, Arkansas, 150 tons; McCook Field, Ohio, 4,500 tons; Fort Omaha, Nebraska, 400 tons; Fort Riley, Kansas, 14,000 tons; Fort Robinson, Nebraska, 1,500 tons; Rock Island Arsenal, 800 tons; Scott Field, Illinois,

3,600 tons; Fort Snelling, Minnesota, 6,000 tons; Selfridge Field, Michigan, 5,900 tons; Fort Sheridan, Illinois, 6,000 tons; Fort Thomas, Kentucky, 2,800 tons. In addition bids are asked for small quantities of anthracite at a large number of Middle Western army posts.

Class 1 Railroads Consume 9,373,000 Tons Of Coal in April at \$3.56 per Ton

Class 1 railroads of the United States consumed 9,373,000 net tons of coal during April, 1923, as charged to account 394, compared with 14,340,000 tons during the preceding month and 6,856,000 tons in April, 1922, according to a recent report of the Bureau of Statistics of the Interstate Commerce Commission covering 176 steam roads. During the first four months of 1923 these roads consumed 39,530,000 tons as compared with 31,361,000 tons during the corresponding period of 1922. The delivered cost per ton in April last was \$3.56 compared with \$3.45 for the corresponding month of last year.

Consumption of fuel oil during April totaled 147,694,000 gallons compared with 155,949,000 gallons in March and 116,364,000 gallons in April, 1922. The totals for the first four months of 1923 and 1922 were 589,498,000 and 474,927,000 gallons respectively.

THE TROUBLE SEEMS TO BE that Mexico can't get along without American capital and can't get along with it.—*Passaic News.*

Coal Commission Postpones Submission of Report Until July 9; Government Developing Coal Sense

BY PAUL WOOTON
Washington Correspondent of *Coal Age*

So as to make possible a stronger and a more comprehensive report, the President's Coal Commission has sacrificed compliance with the literal date set for its special anthracite findings and probably will release it for publication on July 9 instead of July 2, as had been planned. The report is expected to be in final form on July 4, but to insure a maximum amount of publicity it must be delivered in advance to the press so that copies may be mailed to publications for use on July 9.

While one of the causes of delay is the late receipt from certain companies of essential data, Chairman Hammond and Commissioner Smith made it clear in their statement to the press that the delay is in no way chargeable to dilatoriness on the part of those making returns. The task in some instances was greater than could be accomplished within the time limit. Some delay is chargeable to compilation and the commissioners themselves must have some time to digest and interpret the recapitulation which has been made.

In some quarters the delay in the issuance of the report is regarded as serious. This is based on the fact that it cuts down the time during which it could be considered by those engaged in the anthracite wage negotiations. Had the report been available promptly on July 1 it would have strengthened the position of the conservative leaders at Scranton, some contend. There is general feeling of regret that it did not come through on scheduled time. The plain terms of the law are that the report should be made on or before July 1. The fact that this was not done is certain to result in criticism. This is particularly the case since those engaged in the anthracite negotiations were keyed up to expect the report on July 1.

STRESS BEARING ON ANTHRACITE WAGE NEGOTIATIONS

The commission undoubtedly owes its existence to the anthracite situation. Had that not become acute at the time the legislation was under consideration the bill probably would not have passed. This is given as an additional reason why nothing should have been allowed to prevent the report coming out so as to give the maximum amount of time for its consideration at this particular stage of the wage negotiations.

The position of the commission apparently is that it is better to sacrifice a few days and have a much better report, one which will be of more service during the wage negotiations than would have been the case had it been issued with the material at hand on July 1. To issue the report on July 1 would have meant its completion on June 28 or 29 so as to provide the time necessary for publication release. As it is, the commission is keeping in particularly close touch with the situation in the anthracite region, where Judge Daniel M. Link, of Indiana, is acting as observer for the commission.

Judge Link was described at the commission as a man with eyes and ears and good judgment. Chairman Hammond, acting for the commission, addressed a letter to the officers and delegates at the Tri-district anthracite mine workers' convention at Scranton urging them not to bind their scale committee but to leave all questions open to consideration by the joint scale committee.

The extent to which the Attorney General may have been guided in dismissing the Indianapolis indictments by the recommendations of the Coal Commission is not known, but it is certain that the commission is very much of the opinion that nothing constructive could have been obtained from pressing that action and that its discontinuance would be in the public interest.

The fact that the Attorney General took counsel with the Coal Commission before action in that case and the fact that he dismissed the indictments is regarded as evidence that the government is displaying more practical sense than ever

before in the handling of coal problems. The existence of these indictments was one of the great impediments to settlement last summer, as it was the most valuable card in the hands of the diehards among the operators.

Ever since those indictments were brought it has been generally believed that they were ill conceived. Had they been pushed it would have thrown the industry into complete chaos. Judge Anderson is perhaps the only federal judge who would have taken them seriously. It has become increasingly clear, many contend, that large blocks of tonnage must be represented in any agreement when the coal from six states compete in a single city. It called for an interstate agreement, but along came the Attorney General of the United States professing to see restraint of trade in the well-established processes of collective bargaining.

The dismissal of the suit not only indicates that there is to be more sanity on the part of the Federal Government in the handling of coal problems but it emphasizes the conspicuous failures which have followed the efforts to deal legalistically with coal problems. It emphasizes the advantages of placing such matters on a plane of human understanding rather than on one of court procedure. The check-off and other indictments have been singularly barren of results, particularly when compared with the real results which followed Mr. Hoover's voluntary program, which prevented a runaway market when there was not a vestige of law to strengthen his arm.

The President's speech at Cheyenne and the assigned-car decision are other signs that federal authorities are becoming educated in coal. The experience here during the last strike and the results in the Ruhr demonstrate beyond peradventure that coal cannot be mined with troops. The problems which confront the industry are myriad, but the Coal Commission is fully expected to urge a code of conduct which will take these disputes out of the realm of hostility into one of sane and practical negotiation.

During last week the commission conferred with a committee from the Massachusetts Legislature. The committee was composed of Senators and Representatives. John W. Haigis was its chairman. The committee discussed the anthracite situation in its relationship to New England.

Trade Commission Puts in More Evidence To Prove Charge Against Dock Men

The second week's hearing in St. Paul of the Federal Trade Commission's charges against the Northwest Dock Operators' Association continued to bring forth evidence tending to show that the dock association worked to eliminate independent coal concerns by refusing to make contracts with them and by making discriminating prices against them, also by attempts to bring about monopolistic control of the trade of this district. What is assumed to be an admission of similar position under the law is presented in the immediate withdrawal of the Pittsburgh Coal Co. from the association upon the Supreme Court decision that the hardwood lumber association was a conspiracy.

Evidence has been presented to prove that association members refrained from bidding direct on municipal steam business requiring team delivery in competition with the local retail dealer, and that they refrained from approving contracts with dealers except where the contract covered a public utility with a definite tonnage covered by contract between the utility and the dealer. About 1,000 or more documents are to be introduced in evidence by the prosecution. The defense professes to be quite secure in the propriety of its answer, and expects to offer complete and adequate explanations which will justify all actions that are admitted, and denies that any illegal methods or policies have been pursued.

Production and the Market

Weekly Review

The coal trade is fast losing its fear of a suspension of anthracite mining on Sept. 1, and soft-coal prices in the East are being dragged downward as this belief grows. It is generally conceded that if the anthracite operators and mine workers should announce the signing of a contract there would be an immediate slump in the demand for domestic anthracite and independent prices would drop from their \$11 peak to company circular.

Soft-coal trade as a whole has settled down to a normal summer grind differing only from pre-war conditions in that a much larger proportion of the coal is now going forward on spot purchases and the railroads and large industrials are accumulating stocks.

PRICES SHOW DOWNWARD TENDENCY

Prices are uneven and the general tendency downward. *Coal Age* Index declined two points last week to 203 on July 2, corresponding to an average price at the mines of \$2.46 per net ton. Quotations for Clearfield, Cambria, Somerset, Pittsburgh and Mount Olive district coals show no change from last week, but there were declines in Pocahontas, Pittsburgh No. 8, southern Illinois and eastern Kentucky coals and advances in Kanawha, Hocking and western Kentucky.

Production of soft coal is declining at about the same rate as prices. The estimated output in the third week of June was 10,411,000, with a decline indicated in the last week of the month. The output for the first half of the year was about 273,000,000 net tons, which is above the average of the same period of the three most prosperous years of recent times.

The feature of the week is the showing in the government statistics of coal exports in May of the large tonnages taken by Europe. More than 481,000 gross tons of bituminous coal cleared from ports of the United States for Europe in May. Of this 238,427, or nearly half, was destined for France, Italy received some 57,000

tons and The Netherlands 43,000 tons. The movement to South America was brisker in May than a year ago, partly because of the strike here last year and partly because England has not been able to meet market demands of her foreign customers. Federal Fuel Distributor Wadleigh will release a summary of the export situation the end of this week, to which will be added expressions of opinion from some of the leading American and British exporters.

Buying in the Middle West is at low ebb. There is no demand and storing by large consumers has almost ceased. Curtailing of production by industries, particularly the textiles, in New England, has put a damper on business there. Receipts have diminished and new

business is scarcely heard of. In Pittsburgh the market is easier than a week ago. More mines are closing each week.

Lake dumpings continue heavy. Receipts at Milwaukee are so heavy and shipments so light that the docks will soon have received about 50 per cent of last year's season's total.

Dumpings at Hampton Roads for the week ended June 28 for all accounts were 355,961 net tons, as compared with 265,060 net tons the previous week. The feature of the Hampton Roads situation at the end of last week

was the large accumulation and the scarcity of tonnage awaiting coal.

Production of beehive coke increased during the third week of June, the total output being estimated at 413,000 net tons, an increase over the revised figure of the preceding week of 6,000 tons. Cumulative output during the year to date is 9,672,000 net tons.

Little Doing in Chicago

Trade continues flat in Chicago. There is no demand for anything. The few railroads and other large consumers who are storing have begun to ease a little, thus choking down about the only important outlet the producers of the Middle West have had for lump, egg and nut coals. Retail call amounts to nothing and is not expected to make itself felt for some time. Not only were Illinois prices not advanced July 1, as they were June 1, but it is a lucky producer indeed who manages to get the circular price. Screenings are the bane of the Middle West's life just now. Good Franklin County coal below nut size sells now for \$1.50 on this market. Smokeless and anthracite reach Chi-

cago in small but steady volume and are moving into consumers' cellars with a shade more celerity than is usual at this slack time of year, because of impending labor troubles in the anthracite fields.

Midwest Fields Full of "No Bills"

Southern Illinois mines are working two and three days per week, with "no bills" being carried everywhere. What little demand there is seems to be largely for lump, the "no bills" being carried largely in the egg, nut and steam sizes. Though the circular price is \$4.35 some of the larger producing companies are offering 6-in. lump at \$3.85, egg at \$3.85 and nut at \$3, while independents are offering lump at \$3.25, egg at \$3, and nut at \$2.50, with mine-run ranging between \$2.25 and \$2.50 and screenings being offered freely at \$1.50.

In Jackson and Perry counties better working time has been experienced by some of the operators in this district who have been successful in obtaining railroad storage orders. In the Standard field coal is actually being sold at less than cost, 6-in. lump being offered at \$2.25 per ton, 2-in. lump at \$2, steam, nut and egg \$1.75 per ton and screenings \$1.15@1.25.

Coal Age Index of Spot Prices Bituminous Coal F.O.B. Mines

Index	1923		1922	
	July 2	June 25	June 18	July 3
Weighted average price	\$2.46	\$2.48	\$2.54	\$3.51

This diagram shows the relative, not the actual, prices on fourteen coals, representative of nearly 90 per cent of the bituminous output of the United States weighted first with respect to the proportions each of slack, prepared and run-of-mine normally shipped, and second, with respect to the tonnage of each normally produced. The average thus obtained was compared with the average for the twelve months ended June, 1914, as 100, after the manner adopted in the report on "Prices of Coal and Coke, 1913, 1918," published by the Geological Survey and the War Industries Board.

St. Louis

Domestic demand still quiet, brought about largely by the fact that there will be no increase in the price effective July 1. Dealers do not expect any increase in business before the middle or latter part of July. There is only a fair demand for anthracite in spite of the fact that Western shipments have been temporarily curtailed. Coke, while not plentiful, is easier and the demand has been better on account of the contemplated increase of 25c. per ton effective July 1.

Western Kentucky Screenings Advance

The general demand in the western Kentucky field is unsteady, operations being controlled by the activity of their selling organizations. Mines producing only mine-run are out of the running. Prices are generally firm all along the line in spite of lack of orders for prepared coal during the last few days. This has caused a slight slump in production of screenings. At the same time there probably has been a little better steam demand due to reduction of storage stocks, and screenings have advanced from \$1 a ton last week to \$1.25 now, with some houses quoting \$1.35. Mines haven't much business ahead as a rule and are operating on day-to-day orders, with frequent closedowns.

Eastern Kentucky Is Weaker

Eastern Kentucky coal is reported as somewhat weaker all along the line, slight breaks having been reported in egg and lump sizes, but block is firm. Mine-run is unchanged, but screenings weakened a little, as production of prepared has been quite fair, especially on movement to the Lakes in spite of the L. & M. embargo, and to the north and west. Car supply is excellent.

It is reported that an immediate delivery contract of 15,000 tons of Hazard screenings was taken at \$1 a ton during the week, but that the contract for the Cincinnati Water Works annual supply was taken on the basis of \$2.50 a ton.

At Kansas City the retail price of Arkansas semi-anthracite advanced another 50c. on July 1. This is the second 50c. increase since the slash of early spring, made in an effort to encourage summer buying and storage. So far the advances have not forced the domestic market. Operators, jobbers, wholesalers and retailers under the title of "The Associated Coal Bureau of Kansas City" by an intensive advertising campaign are trying to educate the public in the hazards of the coal business and the factors that determine the price of coal. The campaign has not been on long enough for results yet to be noticeable.

Utah weather is really hot now and dealers are doing very little business. The slack market is very soft at \$1.75. It will improve as soon as the sugar companies begin buying heavily. The coast business is fair. Lump and intermediate sizes are in demand there as well as locally.

Early Improvement Improbable in Ohio

The Cincinnati market is sluggish and refuses to respond even to drastic cuts made on lower grades of slack. West Virginia 2-in. lump was quoted \$2.50@2.75 on July 2, as compared with \$2.75@3 the previous week, and south-eastern Kentucky 2-in. lump at \$2.50@2.75 as compared with \$2.50@3 the week previous. There was little change in the Columbus and central Ohio situation. Buying is at low ebb and there are no immediate prospects of improvement. Steam trade is quiet and there is no disposition on the part of steam coal users to stock up. The best customers are the utilities and railroads although some tonnage is being taken by industries. The domestic trade is quiet, many householders believing that prices are going to be lower. Output in the Hocking Valley, Pomeroy and Crooksville district is around 25 per cent. At Cleveland the market is dull and operators say that while they are receiving some inquiries, little improvement is looked for in the immediate future.

Conditions at Pittsburgh are a trifle easier than a week ago. Demand in the open market is poor. The market at Buffalo continues inactive with a good-sized tonnage on the tracks unsold.

Car supply on the Chesapeake & Ohio, Virginian, Norfolk & Western and the Baltimore & Ohio in West Virginia shows some improvement, but is not giving producers as much concern as lack of orders. Additional high-volatile mines in West Virginia suspended operations late in June rather than sell their product at a loss.

New England Market Turns for Worse

In New England the current market has gone from bad to worse. Receipts have diminished, and there is almost an utter lack of new business. Industrial plants have curtailed in many directions and a surprisingly large number of textile mills have shut down for periods over the holiday. Buyers have little interest in the spot market except as their curiosity is piqued by quotations at new low levels. For the average sales agency the present state of trade here holds little encouragement for July and August, although there are those who are still predicting serious transportation difficulties in the autumn.

Central Pennsylvania coal quotations have changed very little. Most operators feel it better to shut down than sell at less than cost. A few of the higher grades are commanding about the same range of price that has obtained for the past sixty days, but even producers of these con-

cede that buying power has practically disappeared from the market.

Pocahontas and New River share the general depression. Accumulations continue heavy at Hampton Roads and prices the past week have shut off from \$5.50 to \$5.10 on second grades, with No. 1 Navy standard coals at only 25 to 35c. more. For distribution inland from Boston, Providence and Portland on car prices also slumped, \$7 to \$7.25 being the asking figure. No orders of any volume have materialized either f.o.b. or at this end, and there is a feeling that the new demurrage tax which goes into effect July 1 will tend to curtail shipments to the piers.

From Philadelphia as well as from Norfolk and Newport News the number of loadings recently has been notably less. Transportation continues in ample supply and today there seems no anxiety about coal coming forward in volume sufficient for all possible needs.

Seaboard Market Shows Little Life

Along the seaboard the market is quiet. At New York the daily number of cars at the terminals averages about 1,900, a slight increase over the previous week. Demand continues quiet. The Philadelphia market shows no added strength. There is a feeling that the railroads will come into the market soon. There are some bright spots in the market at Baltimore and some of the better grades, such as Pools 71 and 9, are hard to pick up at times. Despite this there is no real upward tendency with regard to prices.

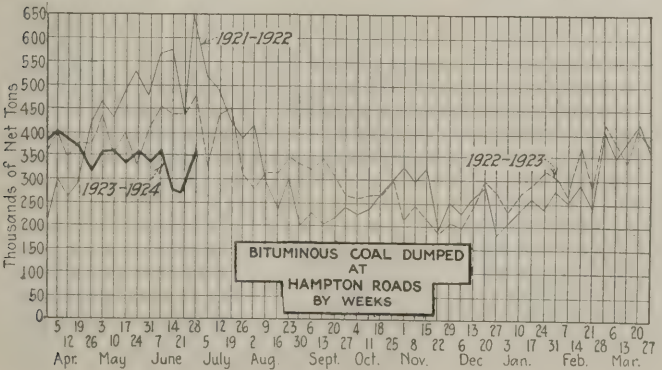

Dullness prevades the Birmingham market. Demand for steam coal is poor, while inquiry for the lower grades of lump and other domestic coals is easier. Regardless of the fact that there is scarcely any market for commercial coal and this class of mines is operating only about half time, production for the week ended June 16 was 359,000 tons. Mine labor is becoming scarce in some sections on account of the exodus of negroes to the North and West.

Heavy Dock Receipts at Duluth

The second largest week as far as dock coal receipts are concerned was scored at Duluth last week when sixty-four cargoes arrived, five of which were hard coal. Thirty-four others are reported on way, four of which are anthracite. It is estimated there are about 2,500,000 tons of bituminous and 150,000 tons of anthracite on the docks. Receipts at Milwaukee so far this season amount to about 1,329,870 tons of all coals, or about 50 per cent of last year's season total. There is much less buying of lake coal in the Pittsburgh district. Shipments of anthracite from Buffalo for the week were reported at 139,000 net tons, of which 59,000 tons were for Duluth and Superior, 43,700 tons for Chicago, 33,700 tons for Milwaukee, 1,400 tons for Sheboygan and 1,200 tons for Kenosha. Lake Erie dumpings during the week ended July 2 was 1,034,908 net tons of cargo coal and 57,239 tons of fuel coal, making the total dumpings this season 10,345,147 tons.

Anthracite Market Fails to Speed Up

The anthracite market fails to show any increased activity notwithstanding that the demands to be made on the operators by their employees have been announced. Consumers continue to be urgent for supplies, egg and stove sizes being the most wanted. Retail dealers are urging

shippers for deliveries. The steam coals are not moving easily. Some companies continue to store large tonnages, which enables the independent operators to dispose of their product easier.

"There was no slackening in the rate of anthracite production during the third week of June," says the Geological Survey, "and production again passed the 2,000,000-ton mark. According to reports from the principal anthracite-carrying railroads, 39,055 cars were loaded, and on this basis it is estimated that the total output, including mine fuel, local sales, and the product of dredges and washeries, was 2,042,600 net tons.

"The cumulative output during the present calendar year to date stands at 49,287,000 tons and compares favorably with the output in the years of great activity in anthracite mining."

Slight Increase in Coke Output

Practically the entire increase of 6,000 net tons in the production of coke during the week ended June 16 over that of the preceding week occurred in Kentucky and Alabama, says the Geological Survey, where the railroads reported loadings nearly as twice as large as those of the week before. Production in all other districts except Pennsylvania and Ohio was practically the same as in the week ended June 16.

Foreign Market And Export News

British Coal Output Shows Slight Decline; May Exports Heavy

Great Britain's coal output for the week ended June 16 was 5,651,000 tons, says a cable to *Coal Age*. This compares with 5,654,000 tons the preceding week, a decrease of 3,000 tons.

The Welsh coal trade is quiet, due to the fact that the European demand has returned to something like normal. On the other hand the operators have plenty of orders in hand and are showing no anxiety. Exports to South America are particularly good. A new feature is the circulation of inquiries from Australia, on account of the labor troubles in that country. The introduction of the third shift at the docks has resulted in a much better clearance of coal, and ships are being got away on time.

With the exception of the gas coals section, the market in the north of England is particularly quiet. The European buyers are sitting tight waiting for prices to fall. Gothenburg has taken 25,000 tons D. C. B. at 32s. 7d. c. i. f. and Belgium is inquiring for 10,000 tons of best coking coals monthly for the rest of the year.

British coal exports in May amounted to 7,684,405 tons, which was the largest tonnage of coal ever exported from Great Britain in a single month according to official statistics of the British Board of Trade received by the Bankers Trust Company, of New York, from its English Information Service. A total of 33,220,230 tons of British coal were exported in the first five months of the present year, or 3,700,000 in excess of British coal exports during the same period of 1913.

Germany continues to be a heavy purchaser of British coal.

Market Quiet at Hampton Roads

Business at Hampton Roads was unusually quiet last week, with prices continuing to break, and with a seasonable dullness pervading the situation. Bunkers, only, appeared to be holding to the average, with coastwise and foreign trade at low ebb.

Considerable foreign movement on old contracts resulted during the week, but

no new orders were reported by shippers. The movement of coal to the West by rail continued to divert attention from the Norfolk & Western and Chesapeake & Ohio lines.

Although the approach to July 1 was expected to disclose a number of new inquiries for coal during the coming year, they failed to materialize. The inclination throughout the field was to depend largely upon the spot market and to take chances. The tone of the market was exceedingly weak.

News Items From Field and Trade

ALABAMA

The DeBardleben, Empire and Corona coal companies, three of the largest operating concerns in the state, have been merged. Henry T. DeBardleben, president of the new company, announces the issuance of \$4,000,000 first mortgage 6 3/4 per cent gold bonds dated July 1, the proceeds of which will be applied to payment in part for the properties of the three companies absorbed. The new company represents an annual production of 2,000,000 tons and has valuable unopened seams.

The Imperial Coal & Coke Co., it is announced, will install a complete water works system at its Majestic Mines, in the northern part of Jefferson County, a reservoir or standpipe of 100,000 gallons capacity being provided, with the necessary water mains to cover the camp. Septic tanks or pit toilets also will be installed at all residences of employees at Bradford mines, as well as at Majestic mines, operated by the same interest and located near the Bradford pit.

The Galloway Coal Co. is constructing a brick commissary building and also a large warehouse at Carbon Hill, the location of extensive mining operations of the company, the improvements to cost around \$50,000.

Incorporation papers have been taken out here by the Consolidated Coal & Mining Co., with an authorized capital of \$50,000, business to begin when \$25,000 is paid in. Officers and incorporators of the new company, which will have offices at Birmingham, are: E. H. Douglass, Calxico, Calif., president; Torcuato Marcor, Chihuahua and Mexico City, Mex., vice-president, and J. J. Healey, Birmingham, secretary-treasurer. J. L. Croft and J. Hughes Croft, Gadsden, Ala., G. C. Healey and A. Eubank, Birmingham, are others interested in the organization.

The Pratt Fuel Company, with headquarters in Birmingham, has purchased the properties of the Dora Fuel Co. and the Kershaw Mining Co., at Dora, Walker County. The consideration is not given, but is said to be a large figure. The addition of these mines at Dora will give the Pratt Fuel Co. an output of 50,000 tons of coal per month. The announcement is made that Frank Marquis, who was president of the Dora company, and John Stone, of the Kershaw company, will be members of the Pratt Fuel Co., with Walter Moore as president. Mr. Moore also heads the Empire Coal Co., of Birmingham. Mr. Moore owned extensive mines near Dora previous to the purchase of these other mines. All of these mines will now be consolidated, under the head of the Pratt Fuel Co. Mr. Moore is said to be planning the erection of a big byproducts plant at Empire and other big enterprises. The mines at Dora have contracts on hand which will require at least one year of steady operation of the mines.

The Porter Coal Co., at Palos, of which Frank House is president, has increased its capital stock to \$100,000, and has commenced operations at the old Porter mine, in Walker County, where the Big Seam or Mary Lee seam of coal is being worked.

ALASKA

By a proclamation issued by the President and made public June 26, the Secretary of the Interior is authorized to operate the government railroad of Alaska, including branch lines, feeders, and telegraph and telephone lines connected with it. Vestment of this authority was made necessary by the completion of the construction of the line last week when the last length of standard-gage track was laid into Fairbanks, thus finishing all the engineering work.

CALIFORNIA

James F. Callbreath, secretary of the American Mining Congress, was the guest of honor at a banquet in Los Angeles, June 7, at the University Club, under the joint auspices of the Chamber of Mines and Oil, the Los Angeles Stock Exchange, and the American Institute of Mining and the Metallurgical Engineers. He spoke on the min-

ing industry. A. C. McLaughlin, president of the Chamber of Mines and Oil, presided.

COLORADO

It is confidently expected by some elements in the Colorado coal industry that the prospective building of the Moffatt tunnel will open to northwestern Colorado a large trade in bunker coal on the Pacific coast. Most bunker coal in American Pacific ports now comes from Australia and even Wales and sells often for as much as \$30 a ton. It is calculated that Routt County coal could be sold at Seattle and San Francisco for half that. The case obstructing the progress of the tunnel project is now before the United States supreme court. It may be decided during June. If the decision is favorable, Colorado is free to sell tunnel bonds and soon thereafter begin construction.

Having completed his term as State Commissioner of Mines, Horace F. Lunt has opened an office as consulting mining engineer at 617 Majestic Building, Denver.

CONNECTICUT

The Connecticut Blower Corporation, Hartford, has been incorporated under the laws of Delaware with a capital of \$250,000. M. E. Keeney, president; C. H. Keeney, treasurer; C. E. Keeney, secretary. The company has taken over the International Blower Co. and the Hartford Sheet Metal Works. The products manufactured and installed include blowers and exhaust fans, blower systems of all kinds, dust-collecting systems, exhaust systems, ventilating systems, etc. The plant of the International Blower Co. will be utilized until autumn, when a considerably larger plant will be occupied.

ILLINOIS

The Roanoke Brick Co., of Roanoke, has purchased the plant of the Roanoke Coal Co. and will operate the mine in the future. The mine now gives employment to 160 men and it is the intention of the new owners to develop the property.

W. R. Trapper & Co., Inc., Fisher Building, Chicago, is a new organization with capital of \$40,000. The incorporators are Sidney H. Ware, James Mayer and George Erickson. The company organizes to manufacture coke as well as mine coal and will deal in both coal and coke.

The Hi-Carbon Coal Co., Campbell Hill, has been incorporated with capital of \$30,000 to deal in and operate coal, fluorspar and fireclay mines and gas and oil wells. It has been organized by E. B. Dick, Byrd Thimig, J. B. Gustat and A. C. Mitchell.

The Abbott Coal Co. has been organized at Pekin by Charles Abbott and associates. A new mine is to be opened on the Abbott land southeast of Pekin, near the location of the Hawlet coal mine.

The Riverton mine of the Peabody Coal Co., which has been closed since May 1 while a new shaker screen was being installed, resumed operations June 15. J. F. Monahan is the district manager.

The Rutland Third Vein Coal Co., of Rutland, has been incorporated with capital of \$100,000 to operate the Rutland mine, which has been discarded for some months. J. L. Bane will be general manager of the company, and M. J. Proctor is the superintendent. J. L. Bane, F. W. Rohrer, F. W. Sauer and M. J. Proctor has been appointed a committee to purchase material for the new company. The steel tower which had settled 7 ft. at one corner since the mine closed down has been straightened. It is planned to resume operations by Aug. 15.

The Orton & Steinbrenner Co., 608 South Dearborn St., Chicago, manufacturers of locomotive cranes, dipper shovels and grab buckets, announce a reorganization of the company and the election of the following officers: P. A. Orton, president and general manager; E. B. Ayers, vice-president; Herbert Mertz, secretary and sales manager; Harry Shaffer, treasurer and purchasing agent; G. L. Niederst, chief engineer, and Alex. Orton, works manager. The reorganization is occasioned by the resigna-

tion of H. G. Steinbrenner as president and the disposal of his interest in the company.

Rumors that Williamson County Coal was pretty well mined out in the No. 6 seam resulted in an investigation which shows that while the west half of the county underlain with seam No. 6 probably will be exhausted by the existing mines in the next 30 years, the eastern half is practically untouched except in the Pittsburg area. Some of the mines now working No. 6 contemplate in time working No. 5, which is from 60 to 100 ft. deeper. This is a thin seam, averaging 5 ft., but is of higher quality than No. 6. The Harrisburg seam is No. 5. Constant mining of this seam will take from 75 to 100 years to work out Williamson County.

Directors of the Sullivan Machinery Co., Chicago, have declared a dividend of \$1 a share, payable July 16 to stockholders of record June 30, 1923.

INDIANA

The boiler room, the hoisting cable and machinery and other mining accessories of the J. & M. Mine, two miles southwest of Linton, Ind., were destroyed by fire recently, entailing a loss of about \$10,000, closing the mine for an indefinite period until new construction is completed. The mine is owned by the High-Grade Coal Co. of Terre Haute, in which Clem and Frank Richards and John T. Beasley are chief stockholders.

The Pine Ridge Mines Co., of Terre Haute, has filed preliminary certificate of dissolution.

The Clinton Coal Co., of Clinton, has arranged with Roberts & Schaefer, of Chicago, to build a four-track steel tippie at Clinton.

The Penna mine, opened about three months ago by the Templeton Coal Co. near Hymera, on the C. M. & St. P. R.R., is just getting into production. It is expected to develop into one of the big producers of that region.

IOWA

The Electric Mining Co. is building a switch from the Burlington tracks near Cuba. The switch is about two miles long.

The Razor Coal Co., of Tuscola, will erect a new office building.

KANSAS

A new steam shovel has been installed at the Moka pit near Mulberry by the Sheridan Coal Co. as a part of a program to increase tonnage.

KENTUCKY

The Consumers Red Ash Coal Co., of Pineville, capital \$2,000, has been chartered by T. P. and R. A. Cairns and B. F. Johnson. The Berger Coal Co., Harlan, has filed amended articles increasing its capital stock from \$150,000 to \$225,000.

Louisville retailers are watching with interest the erection of the first silotype coal handling plant in Louisville, this being erected by the Charles Buddeke Coal Co., at Logan and Breckinridge streets.

Fred J. Hinkebein after 14 years as secretary of the Atlas Coal Co., has resigned and gone with the Moll Wrecking Co., Louisville. He has been succeeded by W. W. Dant, formerly in the retail coal business and distillery business at Dant, near Lebanon.

The Louisville & Nashville R.R. is spending \$8,734,403 in double tracking 89.61 miles of its divisions in the very heart of Kentucky's coal-producing regions in order to facilitate fuel shipments and relieve congestion.

The Elkhorn Star Coal Co., of Pikeville, has increased its capital stock from \$125,000 to \$175,000. New Kentucky incorporations are the Castro Coal Co., of Pineville, capital \$30,000, by W. M. Freeman, E. A. Smothers and C. L. Gooch; the Cumberland Straight Creek Coal Co., Pineville, capital \$20,000, by Col. E. Shaffer, Eula Pursiul and H. J. Gibson.

The work of pouring concrete for the new tippie of Mine No. 1 of the Wasson Coal Co., Harrisburg, has started. The new tippie, which is being erected by the Jeffrey Mfg. Co., may be completed by Aug. 1.

The Old Ben Coal Corporation, one of the largest operating companies in southern Illinois, announces the opening of offices in the Central National Bank Building, St. Louis.

The two big issues that are being used in the platforms of the various candidates for Governor of Kentucky in the fall elections, in an effort to obtain the nomination, revolve around race-track gambling and a tonnage tax on coal. There may be some argument in favor of a tonnage tax, but there are many arguments against it. As a matter of fact a Governor has very little to say about the matter, as he can't make laws, and it is a question for the state legislature to decide on either issue. However, it is certain that there will be a number of bills before the next Legislature on these two subjects.

Charles Geis, of Zanesville, Ohio, and Peter C. McKinney of Oakmont, Pa., holders of one-fifth of the \$400,000 capital stock of the Rockport Coal Co., operating mines at Rockport and Centerstown, have instituted suit in the federal court against the Crown Coal Co., H. L. Tucker, Mrs. Zetta Tucker, James Danks, John T. May, L. D. Smith and Rodney D. Reid, stockholders, asking the appointment of a receiver and an accounting of the business. The petition alleges that H. L. Tucker and his associates have voted excessive salaries to the present officers of the company; that they formed the company known as the Crown Coal Co. and that later they entered into a contract with this company, giving it the exclusive right to sell all coal produced or controlled by the Rockport Coal Co. on which sales a commission of 8 per cent was paid and that these commissions have exceeded \$100,000. It is also alleged that Tucker and his associates have caused to be issued to them many shares of stock in the company for which no cash payment has been made.

The Kentucky & Indiana Terminal R.R. at Louisville has arranged to spend \$1,500,000 for better terminal trackage at Louisville and has ordered a number of switch engines to take care of severe traffic congestion which has been experienced in Louisville over the past few months as a result of heavy traffic and shortage of facilities for handling it. The road operates a bridge across the Ohio River at Louisville and switches for the B. & O., Monon and Southern railroads.

The Southeast Coal Co., of Seco, suffered damage of \$8,000 on June 9, when a large commissary store was burned. Part of the storehouse was saved.

Clifton Rodas, vice-president of the Pittsburgh Fuel Co., Louisville, lost by fire a home valued at \$25,000 Saturday afternoon, June 9. The home is on the upper River Road, and while city equipment answered the alarm, there was no water available.

Officials of the Louisville & Nashville R.R., Louisville, as well as of the Interstate R.R., of Stonega, Va., have denied press reports from Whitesburg to the effect that the L. & N. had obtained control of the Interstate, which would give it a connection from Norton, Va., to the C. C. & O. R.R., which has recently been leased by the L. & N., giving the latter a connection from southeastern Kentucky to the Atlantic coast.

MINNESOTA

An estimate of the number of oil-burning plants in domestic establishments in the Twin Cities places the present number at around 1,000. These plants burn from 50 to 150 gallons of oil a week, during the cold weather, representing, according to the oil concerns, from one-third of a ton to a full ton of coal in heating value. This represents a considerable diversion of business heretofore going to domestic coal.

The find of supposedly anthracite coal at Benoit, near Crookston, proves to be a soft coal of apparently the same grade as that found in the railroad yards nearby.

Albert Lea, comes forward with a find of coal, pronounced by a local geologist as being of the grade similar to that known as blacksmith's anthracite and worthy of a further investigation.

MISSOURI

The case against Fred W. Kleine, of the former St. Clair Coal & Mining Co., by the St. Louis water works for fraud in short weighting, has been dismissed by the prosecuting attorney. The water works weighmaster and Edwin F. Kleine, who were sentenced to two years for prosecution in these frauds have appealed, but the evidence was such that the attorney felt that he could not get a conviction in the case of Fred W. Kleine.

J. W. Alder has leased 2,600 acres of coal land near Amorel on the Kansas City

Southern R.R., and development work will start soon.

MONTANA

The Northern Pacific railroad is building a branch line from Forsythe, about 40 miles up Armell's Creek to Hobsonville, where more lignite acreage is to be opened and stripped with steam shovels.

NEW YORK

William E. Marks Coal Co., of Syracuse, was low bidder for 1,000 tons of buckwheat coal for use at the Onondaga Court House at the opening of bids on June 11. The company's bid was \$5.94 for immediate delivery, but the price for an optional order for 1,000 tons for future delivery was placed at \$6.19. E. J. Leonard bid \$6.04 in both cases, and the C. L. Amos Coal Co., \$6.15.

L. B. Foster Co., Inc., has moved its New York City offices into larger quarters on the 14th floor of the Tribune Building.

The Pennsylvania Coal & Coke Corporation reports a surplus of \$79,707 after all charges for May, against a deficit of \$91,473 last year. For the first five months of the year the surplus was \$549,319, against a deficit of \$48,296 in the same period last year.

OHIO

Papers have been filed with the Secretary of State increasing the authorized capital of the Cambridge Stripping & Mining Co., Cambridge, from \$5,000 to \$20,000.

The Southern Ohio Coal Exchange reports that out of 445 mines reporting for the week of June 9, a total of 227,090 tons were produced, with a full-time capacity of 752,993 tons. Of the shortage of 525,903 tons, railroad disability or car shortage caused a loss of 59,387 tons; labor shortage, 19,406 tons; strikes, 5,010 tons; mine disability, 14,574 tons, and no market, 427,226 tons. In the eastern Ohio field during the same week 16,562 cars were ordered, of which 14,047 were placed and 11,274 were loaded. This was an 85 per cent car supply.

Suit for \$150,000 damages has been filed in Common Pleas Court by the McIntire Coal & Builders' Supply Co., of Zanesville, against the Pennsylvania Railroad Co. and the Zanesville Terminal Railroad Co. for alleged failure to furnish shipping facilities to it at Zanesville since 1918. The coal company says, in the petition, it had an agreement with the Zanesville Terminal company for service over a belt line at Zanesville, and that when the short line was sold to the Pennsylvania Co., April 27, 1917, service was refused.

OKLAHOMA

The Gem Coal & Mining Co. is the firm name of a new coal mining concern just organized at Henryetta. The company is capitalized at \$75,000 and announces that it will develop coal mines near Henryetta. The incorporators are Duncan McKay, Elizabeth McKay and J. E. Thompson, all of Henryetta.

The Chicago, Rock Island & Pacific Ry. will abandon its coal mines in Oklahoma and Arkansas and convert its locomotives to oil burners, according to announcement by Peter R. Stewart, Arkansas Commissioner for the Southwestern Interstate Coal Operators. Opinion among coal operators is that the railroads in changing from coal to oil-burning locomotives and the use of fuel oil in many industrial plants has curtailed the consumption of coal in Oklahoma until the mine output will have to be restricted to prevent overproduction.

PENNSYLVANIA

J. O. Durkee, formerly with H. C. Frick and the Hillman Coal & Coke Co., has been appointed chief mine inspector with the Bethlehem Mines Corp.

The Suffolk Coal Co. has purchased 130 acres, including the Langcliffe colliery in Avoca, from the New York & Pittston Coal Co. Title carries with it the coal in the mines and surface title. Practically all the stock of the New York & Pittston company was held by Pittston families. The consideration has not been made public. The new owners have carried on mining operations on the land for some time.

Since acquiring the mine of the H. D. W. Coal Co. in Preston County the Preston Smokeless Coal Co., organized not long ago,

has materially increased the capacity of the mine which is now producing at the rate of 450 tons a day instead of at the rate of 150 tons a day as was the case before the mine was sold. Among other improvements made has been the installation of cable haulage. This company is developing approximately 125 acres of Freeport coal. Ira L. Weaver and others of Fairmont are interested in the new concern.

The following coal companies were incorporated at the State Department, Harrisburg, recently: **Thompson Run Mining Co.**, Ellwood City, mining and preparing bituminous coal for the market; capital, \$40,000; incorporators, Harry L. Clark, 216 Glenn avenue, Ellwood City, treasurer; Clyde Gibson, New Castle, and J. E. Drake, New Castle. **Universal Coal Co.**, Dravosburg, mining and quarrying coal and limestone; capital, \$6,000; incorporators, Anastasia Bielski, Dravosburg, treasurer; Vincent Bielski and Alexander J. Bielski, Dravosburg. **Noel Coal Co.**, Uniontown; capital, \$20,000; mining coal and manufacturing coke; incorporators, Dick Sherrick, Uniontown, treasurer; J. D. Sherrick, Connellsville, and Harry Strickler, Uniontown.

Since acquiring Mine No. 93 of the Consolidation Coal Co., the Connellsville By-products Coal Co., owned by the J. A. Paisley interests, has been making a number of improvements, with a view to increasing the production of this plant. Sixteen feet are being removed from the bank at Murray in order to provide for side-track facilities. It is also understood that the company has under consideration the question of constructing a large steel tipple with a capacity of 450 tons an hour, which will make it possible to increase the daily production of the mine from 500 tons a day to about 3,500 tons a day.

It is estimated that within a period of six weeks up to and including May 25 there were produced in northern West Virginia no less than 5,362,350 tons of coal, the largest production during that period being in the week ending May 19, when the output reached a total of 664,500 tons. It has been possible to produce that large a tonnage notwithstanding the fact that about half the mines in the northern part of the state are idle. Approximately 275 are not in operation and about 290 are producing.

Chief Walsh of the State Department of Mines, who is anxious to reduce mining accidents and to keep the department in the front rank in maintaining a high standard of safety work, has completed arrangements to have operators and miners in the anthracite region devote two weeks to a careful study of all phases of mining that have a bearing upon the safety and welfare of the employees.

A deal was closed recently whereby J. H. Weaver, of Philadelphia, became the owner of coal lands in Cambria County owned by Joseph and Michael Farren. The price was said to be \$165 per acre and the total consideration was \$85,000. The purchase also includes the Murry estate adjoining, which Michael Farren is executor. The coal will be mined near Ebensburg.

The Superior Coal Co. has closed down indefinitely its mine at Superior, Fayette County.

E. A. Siemon, of California, Pa., general superintendent of the Diamond Coal & Coke Co., a subsidiary of the Hillman Coal & Coke Co., has been appointed assistant general superintendent of the latter company, in charge of several mines, including the mines of the former company and several others.

The State Department of Mines is unaffected by the new administrative code which is now being put into effect at Harrisburg. The code originally made the department a bureau of the Department of Labor and Industry, but opposition to this plan resulted in an amendment that kept the activities of the commonwealth relative to mining under a separate department.

A State charter was issued recently at the State Department, Harrisburg to the Pilgram Coal Co., Pittsburgh, mining and preparing coal for the market. Capital, \$5,000. Treasurer, J. D. C. Miller, 213 North Elizabeth Street, Hazelwood, Pittsburgh. Incorporators: C. F. Kiefer, Pittsburgh; J. D. C. Miller, and David E. Meigs, Swissvale.

What promises to be the largest coal-mining operation in the Myersdale district of Somerset County was launched recently when application was made to the Governor for a charter for a corporation to be known as the Blue Lick Coal Co. The projectors of the new company are Frederick Rowe, Frederick E. Rowe, Clarence F. Rowe and Clyde J. Rowe, all well-known coal operators in the Myersdale field except Clyde J. Rowe,

who is operating at Wellersburg, Pa., and Mt. Savage, Md. The tract includes 1,300 acres and will be worked from a number of openings which will be connected with both the Baltimore & Ohio and the Western Maryland railroads by a broad-gage railroad four miles in length. It is thought the road will be finished in time to start three or four operations before cold weather sets in.

Russell A. Tippins has resigned as superintendent for the receivers of American No. 1 coke plant of the American Coke Corporation, at Linn, Fayette County. The duties of the position have been taken over by Gibson Hardy, of Orient, general superintendent of the American No. 1 and Orient plants of the company. The American No. 1 plant was closed down a few weeks ago and is now resuming operations again in full. The Orient plant has fired 80 more ovens and now has 250 out of a total of 480 in blast.

Officials of the United Mine Workers in the anthracite coal fields are reported to be planning to organize the John Mitchell Life Insurance Co.

Governor Pinchot has appointed T. Henry Walnut, of Philadelphia, as chairman of the state workmen's compensation board. Mr. Walnut, who is an attorney and former assistant United States district attorney, will take the place made vacant by Harry A. Mackey, who was appointed under the Brumbaugh administration.

Alex Campbell, of Pittston, general chairman of the Pennsylvania Coal Co. miners, has been elected international board member of the United Mine Workers, according to complete returns of the district election recently held. The contest between Campbell and Michael Kosik, of Dupont, was the only one not definitely settled early in the count. With the count completed, Rinaldo Cappellini's plurality over William J. Brennan for the district presidency is 9,530. Cappellini received 24,500 votes, while Brennan's total was 14,970.

Investigation of books and records of anthracite companies was ordered by Auditor General S. S. Lewis, June 21, as the result of discrepancies between market and reported value of anthracite. The aggregate of anthracite recorded for 1922 fell short of estimates, the Auditor General stated. Mr. Lewis intimated that charges in excess of 12 1/2 per cent were being passed on to the consumer. "It is my desire not only to determine the aggregate value but as well to standardize methods of reporting and to bring the whole practice into conformity with the law," the Auditor General declared. H. J. Cassidy and N. Nester Grimm, special investigators of the department, will make a tour of the anthracite field and report to Mr. Lewis.

An opinion by Deputy Attorney General J. W. Brown to Joseph J. Walsh, chief of the State Department of Mines, holds that if bituminous coal miners are using cars which are not of uniform capacity and cars which are not branded they are violating the law. The opinion states that the act of June 1, 1883, P. L. 52, in Sec. 2, provides as follows: "That at every bituminous coal mine in this Commonwealth, where coal is mined by measurement, all cars, filled by miners or their laborers, shall be uniform in capacity at each mine; no unbranded car or cars shall enter the mine for a longer period than three months, without being branded by the mine inspector of the district, wherein the mine is situated; and any owner or owners, or their agents, violating the provisions of this section, shall be subject to a fine of not less than one dollar per car for each and every day as long as the car is not in conformity with this act, and the mine inspector of the district, where the mine is located, on receiving notice from the check-measurer or any five miners working in the mine, that a car or cars are not properly branded, or not uniform in capacity according to law, are used in the mine where he or they are employed, then inside of three days from the date of receiving said notice, it shall be his duty to enforce the provisions of this section, under penalty of ten dollars for each and every day he permits such car or cars to enter the mine: Provided, That nothing contained in this section shall be construed or applied to those mines who do not use more than ten cars."

UTAH

The United States Fuel Co. is making a new opening in Panther Canyon and expects to be shipping coal from there soon.

George W. Hahn, of the United States Fuel Co., has been appointed chairman of the entertainment committee for the convention of the Rocky Mountain Coal Min-

ing Institute, to be held in Salt Lake City, Aug. 27 to 29, in conjunction with the international safety convention.

Two more miners have been convicted in connection with the killing of a deputy sheriff during the strike of last year. The cases were heard in Salt Lake City. The charge was reduced to manslaughter and the men were sentenced to one year in the state prison. Eleven more men are to be tried in connection with the same case.

Eli Taylor, of Salem, has been appointed to succeed Gould B. Blakely as register of the Federal land office in this state.

The United States is trying to recover control of 1,600 acres of coal land in the Fish Lake National Forest in cancellation proceedings against eleven persons. All of the defendants had been granted permission to mine for coal, but the government claims that they did not intend, as the law requires, each to operate separately. Also it claims they have not done any work.

WEST VIRGINIA

Sixteen new companies were formed in West Virginia to engage in the coal business during April, including two non-resident corporations, with an aggregate capital stock of \$2,011,000.

The New River Collieries Co., operating in the New River field of West Virginia, produced a total of 600,000 tons during January, February, March and April. During the first four months of the year the New River company had declared \$4.50 a share in dividends or \$330,546 in all on its 73,477 shares of preferred stock.

The Realization Coal Co., of New York, has been incorporated by Charleston interests in West Virginia. It will have a general office at 2 Rector Street, New York and has an authorized capital stock of \$150,000. The firm is empowered to operate coal mines in various counties of the state.

The Bethlehem Mines Corporation, of Philadelphia, is buying two Marcus screens to be installed in the company's new tippie at Richards.

The Farrell Fuel Co., which maintains offices in Philadelphia and Uniontown as well as Pittsburgh, Pa., announces the opening of a new office at Fairmont. James P. Burns, Jr., has been appointed manager.

Harrison County coal people have organized the Cummings-Bowers Coal Co., with capital of \$50,000, for the purpose of operating in Harrison County. The office of the company is to be at Clarksburg. Identified with the new concern are: A. H. Cummings, Calder A. Lyons, Stanley C. Morris, V. A. Miller, all of Clarksburg, and James H. Bowers, of Lumberport.

Operations on quite a large scale in the Logan field are contemplated by the Dwyer Coal Co., the headquarters of which are at Chapmansville. The company has a total authorized capital stock of \$100,000. The company was incorporated by John J. Dwyer, J. W. Dwyer, R. A. Dwyer, I. D. Dwyer and N. L. Ford, all of Lewisburg.

With a view to engaging in the coal business in the Monongalia field, the High Quality Coal Co. has been ushered into existence by Morgantown business men, this company having a capital stock of \$100,000. Morgantown is to be the headquarters of the company. Incorporators of the new concern were B. M. Chaplin, O. K. Sauerwein, G. H. Saville, H. W. Hunt and T. M. Jones, all of Morgantown.

The Banks Supply Co., Huntington, dealers in mine, mill and factory supplies, having found it necessary to enlarge its plant the second time within two years, is about to build a two-story brick and steel building 50 by 90 ft. on the lot on Eleventh Street adjoining the present property. This building will be used as a showroom for mine and road machinery.

The old pump house at the mouth of Beaver Creek near Gage, formerly used by the Davis Coal & Coke Co. to supply water for its Weaver plant, was burned down during the early part of June. It had not been in operation for some time.

Since the price began to drop, production of coke in northern West Virginia has begun to dwindle and many ovens have been drawn. That has been the case on the Connellsville Division of the Baltimore & Ohio between Fairmont and Morgantown as well as in other sections of West Virginia. Coke manufacturers expect no immediate improvement in the coke situation in view of prevailing low prices.

The Scotts Run Railway Co. is the name of a company recently incorporated with a capital of \$1,000,000, according to an announcement from Morgantown. The com-

pany intends to purchase the Morgantown & Wheeling Railroad Co. when it is placed on sale by trustees of the Monongahela County Circuit Court, July 6, to satisfy outstanding indebtedness, approximating \$1,500,000, it was announced. The incorporators are: H. C. Nutt, Pittsburgh, president of the Monongahela Railroad Co.; Albert Ward, of Pittsburgh, counsel for that company, and Judge Frank Cox, George C. Baker and Stanley R. Cox, of Morgantown, local counsel for the company.

WASHINGTON

Burnett mine hoisted 900 tons of coal June 15, which surpassed all production records for a single eight-hour shift in the history of the operation.

WASHINGTON, D. C.

The U. S. Civil Service Commission announced an open competitive examination for observer and computer in gas analyses to fill a vacancy in the Bureau of Mines, at Pittsburgh, Pa., and vacancies in positions requiring similar qualifications, at entrance salaries ranging from \$1,320 to \$1,620 a year, plus the increase of \$20 a month granted by Congress. The examination will be held throughout the country on Aug. 8. Full information and application blanks may be obtained from the U. S. Civil Service Commission, Washington, D. C., or the secretary of the board of U. S. civil service examiners at the post office or custom house in any city.

CANADA

Profits of the Crows Nest Pass Coal Co., Ltd., for 1922 were \$213,959, as compared with \$411,170 for the previous year, being a decrease of nearly 48 per cent. This is attributed to the five months' strike resulting in a reduction of production from 774,847 tons of coal and 66,569 tons of coke in 1921 to 569,339 tons of coal and 46,368 tons of coke in 1922. After provision was made for depreciation and taxes the profit and loss account shows a debit balance of \$94,874 as compared with a credit balance last year of \$93,725.

The investigation into the charges brought by the striking miners against the Edmonton city police in connection with the strike at the Penn mine, on Jan. 4, ended by a finding that exonerates the police. The charges were that the police brutally clubbed women in dispersing the crowd, that the chief constable fired into the crowd, and that the chief constable was drunk. The last charge was withdrawn during the investigation when it was found that the chief constable was a total abstainer. Justice Walsh found that the police force was acting within its jurisdiction, that no unnecessary violence was used, and that if any injuries were received by the miners or their wives the blame could be placed only on themselves.

According to a report just issued by the Ontario fire marshal, E. P. Heaton, too many substitutes for anthracite have caused the great increase in the number of fires throughout Ontario of late.

The Toronto Board of Education has decided that the entire 17,000 tons of coal required for the current year for the schools of the city shall be Pocahontas coal to be supplied by the Doan Coal Co.

Profits of the Sterling Coal Co., Toronto, which operates mines in Ohio and West Virginia, for the year ending March 31, 1923, including dividends and earnings from investments, and after deducting operating expenses, cost of management, etc., amounted to \$121,945.68, against \$6,788.20 last year. The balance at credit of profit and loss now stands at \$243,183 compared with \$200,672 last year. Current assets stand at \$313,004 and current liabilities at \$252,850.

Association Activities

At an executive meeting of the new board of directors of the National Coal Association held just before adjournment of the annual convention at Atlantic City, M. L. Gould, president of the Linton Coal Co., of Indianapolis, Ind., was elected as director from Indiana. He succeeds A. M. Ogle, president of the Vandalia Coal Co., Terre Haute, Ind., who will serve as director ex-officio during the terms of his four successors in office as president of the National Coal Association.

Trade Literature

Electric Capstan Car Puller. Gifford-Wood Co., Hudson, N. Y. Bulletin No. 74. Four-page folder illustrating and describing how the machine locates cars to be loaded or unloaded.

Erie Lubricated Caterpillar Type Mounting. Erie Steam Shovel Co., Erie, Pa. Bulletin S-60. Pp. 20; 8x11 in.; illustrated. Among the advantages claimed are: The tread links are automatically oiled from internal reservoirs, the link pins have hardened renewable steel bushings, the steel treads are practically indestructible and it can be steered by power from the cab.

Novo Air Compressor Outfits, Type H. Novo Engine Co., Lansing, Mich. Bulletin 153. Pp. 11; 8x11 in.; illustrated. Describes short belt drive with floating idler pulley and independent cooling systems. The engine can be used as an independent power plant if desired.

A trolley folder recently issued by The Yale & Towne Mfg. Co., Stamford, Conn., illustrates and describes its plain and geared types of steel plate roller bearing trolleys, also its cast-iron trolley, with details of tests to which the latter was subjected.

American Air-Tight Doors. Conveyors Corporation of America, Chicago, Ill. Four-page folder describing this non-warping, cast-iron door, particularly applicable to ashpits, coke ovens, boiler settings, dryers, etc.

Mellin Belt Conveyor Idler. Chillingworth Engineering Corp., New York, N. Y. Bulletin No. 3 A. Four-page folder describing both the troughing and return idler.

Circle Showers. The American Hinge Co., St. Louis, Mo. Pp. 12, 5 x 7 in., illustrated. Different types of showers, water heaters, drinking fountains, etc., are described.

Publications Received

Your Telephone—The Voice of Your Business, by Pauline Dunstan Belden, Blodgett Press, St. Paul, Minn. Pp. 71; 4 x 6 in. This little book gives some useful information concerning the telephone, how it should be used, etc.

West Virginia Geological Survey of Morgantown, West Va., has just issued a detailed report on **Tucker County**, by David B. Reger. The book contains 542 pages and is illustrated with 16 half-tone plates and 11 zinc etchings. A separate case of topographic and geologic maps accompany the report.

Bibliography of Petroleum and Allied Substances in 1919 and 1920, by E. H. Burroughs. Bureau of Mines, Washington, D. C. Bulletin 216. Pp. 374; 6 x 9 in.

Explosives, Their Materials, Constitution and Analysis, by C. A. Taylor and Wm. H. Rinkenbach. Bureau of Mines, Washington, D. C. Bulletin 219. Pp. 188; 6 x 9 in.; illus. Explosives are grouped as dynamites, black powders, propellants, detonators and primers.

An Investigation of the Fatigue of Metals, by H. F. Moore and T. M. Jasper. A report of the investigation conducted by The Engineering Experiment Station, University of Illinois, in cooperation with The National Research Council, Engineering Foundation and The General Electric Company. Bulletin 136. Pp. 97; 6 x 9 in.; illustrated.

The Geology of the Mokau Subdivision, by J. Henderson and M. Ongley. Dept. of Mines, Geological Survey Branch, New Zealand. Bulletin No. 24. Pp. 83; 8 x 11 in.; illus.; maps and tables. Informs the reader that the coal measures of the Mokau and Waitewhena districts are found to be of younger age than the Waikato coal measures and gives analyses of coals found.

The Star, Johannesburg, South Africa, on March 14, 1923, published its special annual commercial and financial supplement. Information pertaining to coal is found on page 8, covering the export trade and byproducts.

Third Standardization Bulletin by the Standardization Division of the American Mining Congress. Pp. 387; 6 x 9 in.; illustrated. Proceedings of the third national standardization conference, held in connection with the 25th annual convention of the American Mining Congress at Cleveland, Ohio, Oct. 9-14, 1922.

American Railway Association. Program of the railroads to provide adequate transportation service in 1923. Pp. 12; 8 x 10 in. Statement and resolutions adopted at member meetings of the association held in New York City April 5, 1923, with chart traffic forecast for 1923.

The Black Hills Engineer, formerly the **Pahasapa Quarterly**, published by The South Dakota State School of Mines, Rapid City, S. D. The March issue is almost wholly devoted to the subject of lignite. Results of tests made at the Mining Experiment Station of the State School of Mines on North Dakota lignite are given, also costs.

The Universal and the Fireman's Gas Masks, by S. H. Katz, J. J. Bloomfield and A. C. Fieldner. Bureau of Mines, Washington, D. C. Technical paper 300. Pp. 22; 6 x 9 in.; illustrated.

The coal beds in an area of 462 square miles in Belmont, Monroe, Guernsey and Noble counties, Ohio, not far from Wheeling, W. Va., are described in a report by D. D. Condit, just published by the Geological Survey as its Bulletin 720, entitled **"Economic Geology of the Summerfield and Woodsfield Quadrangles, Ohio."** A precise knowledge of the thickness, extent and purity of the coal beds is given, as well as their geologic structure or slope, their location with respect to routes of transportation, and the composition and heating value of the coal in the minable beds. The bulletin not only indicates the areas in these quadrangles where the Pittsburgh and other well-known coal beds of the northern Appalachian field attain workable thickness but describes the geologic formations and states the resources of building stone, limestone, clay and shale, and underground water.

Owing to the popular interest in the nature and operations of the **Industrial Court Law of Kansas** an account of the law and its workings through the period that it has been in effect has been published by the U. S. Bureau of Labor Statistics as Bulletin No. 322. The report gives the text of the law, which was passed in 1920, a synopsis of the cases filed on the industrial side of the court during 1920 and 1921 showing the methods and principles adopted by the court in its various actions, and an account of the legal proceedings arising in connection with the attendance of witnesses before the court and other activities of the court. A résumé also is given of the annual reports which have been published and a bibliography of books and articles relating to the court is appended. The bulletin is based only on official data and presents no other viewpoint or comment than that of the body under consideration or of the courts discussing it.

The Mines Branch, government of the Province of Alberta, at Winnipeg, has issued a brochure entitled **"Coal Truths,"** which was prepared primarily for the use of the domestic user of Alberta coals, although it is also expected to prove of value to large purchasers of coal, engineers and firemen. The brochure is designed to bring about a better understanding of fuel with a view to greater economy in use. It is profusely illustrated. The text and illustrations of the publication were prepared by Geo. R. Pratt, A. M. E. I. C., fuel engineer, Province of Alberta, Winnipeg, Manitoba.

Fires in Steamship Bunker and Cargo Coal, by H. H. Stoeck, Bureau of Mines, Washington, D. C. Technical paper 326. Pp. 51; 6 x 9 in.; illustrated. This report should be of value to steamship owners and to shippers and buyers of water-borne coal.

Increase of Population in the United States 1910-1920, by William S. Rossiter. Bureau of the Census, Washington, D. C. Pp. 255; 7 x 10 in.; tables, maps and charts. Study of changes in the population of divisions, states, counties, and rural and urban areas; also sex, color and nativity.

Year Book for 1917 and 1918, by Frank W. DeWolf, chief, State Geological Survey, Department of Registration and Education, Urbana, Ill. Bulletin No. 38. Pp. 474; 7x10 in.; illustrated, plates, map and tables. Contains administrative report and economic and geological papers.

Manual for Operators Under Oil and Gas Regulations, by S. E. Slipper, under the direction of O. S. Finnie, director of Northwest Territories and Yukon Branch, Department of the Interior, Ottawa, Canada. Pp. 73, 5x7 in., illustrated; with map showing natural gas resources.

"The Anthracite Strike of 1922," a 62-page pamphlet, has been issued by the Anthracite Bureau of Information, Philadelphia. The brochure is a chronology of the communications and negotiations between the anthracite operators and the United

Mine Workers, including the producers' reply to the miners' demands and embodying a plan for averting future suspensions; also the arbitration proposal—an offer by the operators to refer issues in dispute to a presidential commission; the government's proposal, indorsed by the President and offered through Senators Pepper and Reed; also the agreement of Sept. 2, an extension of wage contract and working conditions to Aug. 31, 1923, pending investigation by the U. S. Coal Commission.

Electric Brass Furnace Practice, by H. W. Gillett and E. L. Mack. Bureau of Mines, Washington, D. C. Bulletin 202; 334 pp.; 6x9 in.; illustrated. Records progress so far made in melting brass electrically.

Specifications for Petroleum Products and Methods for Testing. Bureau of Mines, Washington, D. C. Technical paper 323; 88 pp.; 6x9 in.; illustrated. The specifications noted were officially adopted by the Federal Specifications Board for the use of the departments and independent establishments of the government in the purchase of materials covered by them.

Traffic News

During 1922 fifteen new coal mines were opened along the lines of the **Norfolk & Western R.R.**, making 221 companies organized for producing coal and coke on the road, with a total of 328 separate mines, of which 324 were in actual operation, and 9,731 coke ovens of which 1,052 were in blast. The freight tonnage carried amounted to 37,357,078, an increase of 7,672,143 tons over 1921. Income from freight transportation showed an increase of \$10,451,025.22 over the previous year, while the operating revenues were \$90,314,742.34 and the operating expenses \$67,977,201.90, leaving net operating revenues of \$22,337,540.44. Fuel for yard locomotives for the year cost \$600,379.45, a decrease of \$323,997.40 when compared with 1921, and for train locomotives \$5,999,127.79, a decrease of \$1,771,686.60 for the same period. Fuel consumed by steam locomotives during the year was 2,758,804 net tons, an increase of 515,808 net tons over 1921. Among the securities owned by the railroad company are 9,994 shares out of 10,000 shares of capital stock of the Pocahontas Coal & Coke Co., which is valued at \$999,400. The balance sheet of that company shows a deficit as of Dec. 31 of \$2,037,198.63.

Coming Meetings

Oklahoma Coal Operators' Association will hold its annual meeting Sept. 13 at McAlester, Okla. Secretary, A. C. Casey, McAlester, Okla.

Rocky Mountain Coal Mining Institute will hold its summer meeting Aug. 27 to 29 at Salt Lake City, Utah, in conjunction with the **International Safety and First-Aid Meet.** Secretary, Benedict Shubart, Denver, Colo.

National Safety Council will hold its twelfth annual safety convention at the Buffalo Statler Hotel, Buffalo, N. Y., Oct. 1-5. Managing director and secretary, W. H. Cameron, 168 No. Michigan Ave., Chicago, Ill.

The American Institute of Mining and Metallurgical Engineers will hold its annual meeting in Canada. The meeting will start Aug. 20 at Toronto and end Aug. 30 at Montreal. Secretary F. F. Sharpless, 29 West 39th Street, New York City.

Coal Mining Institute of America will hold its annual meeting Dec. 19, 20 and 21 at Pittsburgh, Pa. Secretary, H. D. Mason, Jr., Chamber of Commerce Building, Pittsburgh, Pa.

The American Mining Congress will hold its twenty-sixth annual convention in conjunction with the **National Exposition of Mines and Mining Equipment**, Sept. 24-29, at the Milwaukee Auditorium, Milwaukee, Wis. Secretary, J. F. Callbreath, Washington, D. C.

Mine Inspectors' Institute of America will hold its 13th annual meeting July 10-12 at Pittsburgh, Kan. Secretary, J. W. Paul, 4800 Forbes St., Pittsburgh, Pa.

New York State Coal Merchants' Association will hold its annual convention on Sept. 10-12 at Sacandaga Park, N. Y. Executive secretary, G. W. F. Woodside, 250 Arkay Building, Albany, N. Y.

COAL AGE

The Only National Paper Devoted to Coal Mining and Coal Marketing

C. E. LESHER, *Editor*

Volume 24

NEW YORK, JULY 12, 1923

Number 2

The Anthracite Report

WHATEVER points of difference the operators and the miners may have with the anthracite report of the Coal Commission they with the public will in the end, if not at once, recognize that Mr. Hammond and his associates have held themselves true to their trust as representatives of the public. A searching inquiry, an array of facts and impartial suggestions and recommendations characterizes the report on anthracite, carried in full in this issue of *Coal Age*. There is no "muckraking," no invective, but temperate, straight-from-the-shoulder statement of the facts as found. So many and complicated are the subjects considered that no brief summary is possible, and numerous matters of major import have been touched but lightly by the Commission at this time with the promise that they will be treated more fully in the final report due in September, which will cover the bituminous-coal industry as well.

Rejecting alike governmental ownership and operation of the anthracite mines, the Commission holds to the view that this industry is charged with a public interest. At the same time it pays public tribute to the many responsible shippers of anthracite who have conducted their business with "restraint and good judgment." The Hudson Coal Co. alone is cited as having obstructed the best efforts of the industry to function in the public interest. Publicity of accounts is recommended through a governmental agency, not so much because of past abuses but as a protection for the future, for the "Commission fears that the concentrated control of the anthracite industry may take indefensible profits." To this the majority of the hard-coal operators will not object. With the exception of the Hudson Coal Co. they have never opposed the efforts of the government to examine their accounts or to publish the results nor have they opposed legislation previously proposed looking to this end. Nor can it be held that the recommendation looking toward active governmental control of the production and distribution, and of prices and wages, during times of national emergency is a reflection on the anthracite operators. Again with the notable exception of the Hudson Coal Co. they have been active participants with the government, state and federal, in these matters in every national crisis in recent years.

The labor monopoly held by the United Mine Workers is described as fully as the natural monopoly of the holders of the unmined reserves of coal and the economic combination of the producers. It is proposed that the labor union be made responsible for its contracts, that where the operators and miners cannot agree and a suspension is in prospect, the matter in dispute be submitted to arbitration, as has been repeatedly urged by the operators and as often refused by the United Mine Workers.

The operators, too, are charged with having been

derelict in looking to the human relationships that tend to bring about better understanding, and in having at times neglected discipline and insistence on efficiency in the pursuit of profitable output. Both sides may well take the advice to "wipe the slate clean" and to try out the suggested plans in a spirit of fairness and tolerance. It is plainly stated that what will in the end be the judgment of the Commission as respects the United Mine Workers will depend upon the spirit they display in the pending conferences with the hard-coal operators.

The Commission has made no startling disclosures of fact. The statistical data and the historical information are not secrets laid bare for the first time. Most of it has been published or has been available in some form by no means entirely *ex parte*. What the Commission has done is to take material from original sources and bring it forth in a form and with a preciseness and detail that will inspire public confidence. Here is an authoritative assembly of facts that while they may not settle all vexed questions in the public mind should satisfy its curiosity.

But what the public may learn from a careful study of this report will be new to most people, fed up on strange tales about the "coal barons." Profits of the producers are given in cents per ton, and judgment as to the reasonableness of from 36c. to \$1.07 per ton is reserved until the corresponding investment can be determined. The mine price represents about half what the consumer pays at his curb—the remaining half is divided about equally between retail dealer and railroad. About 11c. of each dollar paid by the consumer of domestic anthracite is profit to the producer and local dealer, which on a \$16 curb price gives \$1.76, out of which the public pays profit to the industry on both ends and out of which must come the "gouge"!

The anthracite mine workers are not found to be downtrodden, poverty stricken slaves. On the contrary they enjoy, if they work, incomes around \$1,500 to \$2,000 and upward per year, live for the most part in sanitary conditions and are "no longer a submerged or exploited population." The only section of labor that suffers any measure of economic distress are the miner's laborers, whose rate of pay incidentally is largely determined by the miner himself.

The *tout ensemble* of the report will be confusing to the layman because it necessarily embraces such a wide range of subjects. There is a vast opportunity for a simpler set-up of the essential points as they affect and interest the ordinary consumer. The one simple, elemental fact that stands out is that it is strikes of the miners that are the causes of the important shortages of anthracite supply, although no attempt is yet made to assign responsibility for the strikes. Of the three parties at interest, public, operators and miners' union, each may draw a measure of consolation from the report, but the miners the least.

Anthracite Report Will Have Potent Influence on Whole Industry

BY PAUL WOOTON

Washington Correspondent of *Coal Age*

AN HONEST, courageous document has come from the President's Coal Commission. The anthracite report, made public Monday, is destined, many believe, to exert a powerful influence on the entire coal industry. Its twenty-one recommendations indicate that the industry's ills have been diagnosed skillfully. There will be differences of opinion as to the benefits which would follow the application of these recommendations, but it must be admitted that the report suggests no resort to paternalism and places main responsibility on the persons in the industry to conduct it so that imperative public interests will be reasonably served.

The representative character of the Commission is expected to insure serious consideration of its findings by Congress, by the industry and by the public. The case of coal has been laid before a jury of six Americans. The jury forms a splendid cross-section of conservative thought in the country—a jury of men who believe in building on what we have and who take no stock in panaceas or short cuts to Utopia. They cannot be accused of being demagogues or cowards. No one could have brought pressure to bear on them successfully. Any effort to have done so would have been resented promptly and pointedly. It can be said most positively, however, that no such effort was made.

Even the President, who properly might have laid his own thought before the Commission, gave that body free rein and left it untrammelled with any instructions or suggestions. No public agency could have been more free from political influence of any kind. The report that the Attorney General had inflicted some of his ideas on the Commission was without any foundation whatever. Such a rumor was launched, it is believed, to prejudice labor against the report. Since the Attorney General is as a red flag to the United Mine Workers, there could have been no better way to embitter labor against the report than to create the idea that Mr. Daugherty contributed something to it.

The real truth of the matter is that the jury of six Americans moulded its own report. Other than the basic facts, no part of it is the product of the staff. One of the chief points of significance about the report is the fact that it represents the sober, carefully weighed conclusions of men who are representative of the American people and who have had at their disposal the most complete basic data to guide them. The conclusions that have been reached by a millionaire mining engineer, a Jeffersonian Democrat, the editor of the *Atlanta Constitution*, a down-East Yankee, a lecturer and economist reputed to be hostile to corporate interests, and a man who has steered a middle course between employer and employee for twenty years will not be greatly different from the conclusions which would be reached by the majority of American citizens if they had the same well-rounded understanding of the subject.

A mirror has been held up to the anthracite industry and to the coal business in general. Those who want to see their business as the American people see it may do so by gazing in that mirror. The anthracite

situation has been analyzed without reflecting the bitterness which has characterized the relationships of the mine owners and the mine workers. There is a flavor of tolerance throughout the document. It creates an impression of sympathetic understanding, but it expresses very firmly the belief that the public has a right to be insured service by the coal industry. It is made plain that the Commission does not want that service on any terms which will not give fair profits to the owners and wages to the workers in keeping with the American standards of living. It does indicate, however, that the public is in a mood to insist on a steady supply of coal.

It stands out all through the report that the Commission conceives the anthracite business as being affected by public interest and impressed with public use—phrases used several times in the report. One of the most significant statements in the whole report is this one: "Coal is quite as much a public necessity as gas, street-railway service or any other service or commodity that has been brought under public regulation." The Commission admits that there is not sufficient basis in knowledge or experience as to just how far control or regulation should be exercised in insuring maximum service to the public by the coal industry, but the industry itself is asked to modernize its wage agreements and the machinery for interpreting them; to set up an adequate inspection service of its own; to take hold of the problem of resizing and to improve its practices generally, but it also calls upon the public to take a healthy interest in looking out for its own welfare.

The Commission does recognize that any failure on the part of the industry to discharge properly its own responsibility, thereby stopping the flow of coal long enough to imperil the public interest, would justify the government in taking over "the operation of the mines and the transportation and distribution and marketing of the product with full power to determine the wages to be paid the mine workers, the prices at which the coal shall be sold and, subject to court review, the compensation to be paid to land and mine owners." Not more than a month ago the Supreme Court of the United States, in the Kansas Industrial Court case, said that since the adoption of our Constitution the vocations of the coal miner and the coal operator have not been regarded as public callings. The utterance of the Court is a historical fact, but this jury of six representative Americans has decreed something different for the future. That jury holds "that a limited natural monopoly like anthracite, held by a relatively small number of individuals, estates and companies, and supplying a necessity of life for millions of our people cannot continue to be treated as if it were not affected by a public interest."

Of the 21 recommendations, 15 constitute disinterested counsel to men in the coal business. Two of them deal with regulation, two with emergency powers, one with the uniform ton and one is a recommendation to the Interstate Commerce Commission for an investigation of freight rates.

Full use was made of the work of the staff and of the engineering services of outside experts, but the report bears no trace of those contributions. The Commission has worked without respect for the 8-hour day. There was one sitting from 9 a.m. to 6 p.m., with no interruption for lunch.

Report of U. S. Coal Commission on Anthracite

TO THE PRESIDENT AND THE CONGRESS OF THE UNITED STATES:

The U. S. Coal Commission renders herewith as directed by law, its 'separate report on the anthracite industry.'

Both the Congress and the American people are concerned in the questions whether in the anthracite industry a reasonable return on investment can be paid to the owners and operators, decent living conditions and an adequate wage based on American standards furnished to the mine workers, a proper return made to the railroads and the dealers, and coal be delivered to the patrons of the industry at lower prices than those now charged. Furthermore, they want to know what can be done to assure an ample supply of anthracite with a constant flow from mine to consumer. Peace with justice in the industry is the first requisite and economy is the second. To these inquiries the Coal Commission has directed its attention.

Ownership or Regulation?—The fundamental fact in the anthracite coal problem is that heretofore these limited and exhaustible natural deposits have been in the absolute private possession of their legal owners, to be developed or withheld at will, to be leased for such royalties as could be exacted, to be transported and distributed at such rates and in such manner as a double-headed railroad and coal combination might find most advantageous from the point of view of private profit, to be sold at such prices as could be maintained by the restriction of output and the elimination of independent competitors, through such means as the maintenance of freight rates burdensome except to those who, owning both mines and railroads, could afford to be indifferent as to whether their revenue came from the one source or the other.

The Commission does not recommend the abolition of existing property rights, however much might be said for the view that mineral deposits should have been held from the beginning as national rather than individual property. The Commission does not recommend government ownership either by purchase at present value or by expropriation. It does, however, hold the view that a limited natural monopoly like anthracite, held by a relatively small number of individuals, estates and companies, and supplying a necessity of life for millions of our people, cannot continue to be treated as if it were not affected by a public interest.

Coal is quite as much a public necessity as gas, street-railway service, or any other service or commodity that has been brought under public regulation. There should be no secrets from the public in regard to mining costs, profits, salaries, wages or corporate relations. Banks and insurance companies are privately managed because we find by experience that they can be managed more efficiently and economically on the principle of individual responsibility. But, like railroads, they are required to report to a public authority and they are subject to such regulation in the public interest as experience may show to be necessary and public opinion may from time to time approve. The guiding principle in such enterprises is no longer maximum profit to owners but maximum service to the public.

The time has certainly come to establish the same controlling idea in the anthracite-coal industry. There is not as yet a sufficient basis in knowledge or experience to determine what form of control or regulation

will ultimately be most advantageous. What is clear is that in the operation of coal mines, as in the operation of railroads, telephones, water companies or banks, the public interest must be respected and served, and that this requirement places limitation on the rights of owners of coal lands, operators, mine workers, carriers, and dealers. The Commission believes that the principle of individual and corporate responsibility should be maintained as most likely to insure economical and efficient management of the industry, and that the public interest may be adequately safeguarded by the creation of a governmental authority with power to require financial and operating reports, to prescribe uniform methods of cost accounting, and determine conditions on which coal may be shipped in interstate commerce.

The President of the United States should be authorized by act of Congress to declare that a national emergency exists whenever through failure of operators and miners in the anthracite industry to agree upon the terms of employment or for any other reason there is a suspension of mining operations, seriously interrupting the normal supply of anthracite fuel in interstate commerce; and to take over the operation of the mines and the transportation and distribution and marketing of the product, with full power to determine the wages to be paid to mine workers, the prices at which the coal shall be sold, and, subject to court review, the compensation to be paid to land- and mine-owners.

On these subjects more definite recommendations will be reserved for the final report of the Commission since they apply to both branches of the industry.

Prices.—The well-known increase in anthracite prices in the last ten years or so is frequently attributed to profiteering and frequently to increases in wages, but there have been insufficient facts available with which to measure the justice of either accusation. How great has been the actual rise in price, how this rise is related to the general price movement, what items are included in the price the consumer pays for his coal, and especially what profits come out of that price, are questions properly asked.

The average retail price of stove anthracite in 1913 in Boston and Washington was \$8.25 and \$7.50, respectively, the former, however, being the price of a short or net ton, the latter that of a long or gross ton. In 1923 the corresponding retail prices are \$15 for Boston and \$15.39 for Washington. Since 1913 the freight rates from the anthracite mines to these two cities have increased \$1.25 and \$1.14. Eight of the larger coal companies, most of them still closely affiliated with the railroads, are grouped together in price quotations and their product is known as "company" coal, in contrast with the "independent" coal produced by 100 or more smaller "individual" companies. In 1913 the average mine price of stove anthracite was \$3.53 a gross ton; today the quotations are \$8 to \$8.35 a gross ton for "company" and \$8.50 to \$11.50 for "independent" coal.

Thus, in ten years both the retail and the wholesale prices of stove coal have practically doubled. This is in line with the general advance in commodity prices, except that while the wholesale price of metals, for instance, reached its peak in 1917; of chemicals in 1918, of farm products in 1919, and of other commodities in 1920—all with subsequent declines, usually large—the price of anthracite has continued steadily upward.

Anthracite Consumer's Dollar Analyzed—Production, Distribution and Freight Costs

The Consumer's Dollar.—An analysis of the consumer's dollar based on an examination of the books of retail dealers in several of the larger cities may serve to show the component parts of the price he paid. For example, in November, 1922, in Boston the average retail price of stove coal at the customer's curb was \$15.68 a net ton. At this rate a dollar paid for 128 lb. of coal. Of this dollar 45c. represented the sales price at the mine, 23c. the charge for freight, and 32c. the share of the dealer. In New York the average price was \$13.77. Here the dollar paid for 145 lb. of coal, and 56c., 18c., and 26c. represented the division between mine, railroads, and dealers. In Philadelphia the price, figured on a net ton basis was \$12.93, so that the dollar paid for 155 lb. of coal, with 61c., 16c., and 23c. as the respective shares of mine, railroads, and dealers. In Washington the price figured on a net ton basis was \$14.20, and the consumer's dollar paid for 141 lb. and included 58c. as mine price, 20c. as freight, and 22c. to the dealer. In Chicago, at the greater distance from the mines, the consumer's dollar paid for only 120 lb. of coal and included 49c. as mine price, 30c. as freight, and 21c. as dealers' costs and profits. In St. Louis, with a price per ton 44c. lower than in Chicago, the dollar contained only 15c. for the dealer. This abstract of a much larger exhibit is sufficient to show that from 15 to 32c. of every dollar spent for Pennsylvania anthracite remains with the local dealer or possibly in part with a wholesaler from whom he obtained the coal, and between 45c. and 60c. goes to the producer.

It is interesting to the public to know what part of the consumer's dollar commonly goes for profit of operator or retail distributor. A buyer of domestic anthracite in Boston in November, 1922, paid something like 11c. out of every dollar in the form of profit to the producer or retailer of coal. Of this about 4c. went to his local retailer and nearly 7c. to the producer, for his profit on mining and sale at wholesale. Practically the same figures hold for Washington, where the same month the householder paid 3 c. out of every dollar in profit to the retail coal merchant and nearly 9c. out of every dollar as profit to the producer and wholesale distributor of coal.

Another inquiry made by the staff of this Commission has furnished facts intended to be of immediate service to the local buyer of coal. Tables have been made public showing the present wholesale cost of stove anthracite as reported by retailers in nearly a thousand towns and cities from Maine to Minnesota. The items shown include the mine cost of the last shipment received prior to May 15, 1923; the freight charges, and the total cost of this shipment on the dealer's siding. The range of latest quotations to these dealers on May 15 are also given, from which it will be seen, for example, that in New England the more common wholesale prices quoted were from \$10 to \$11.50, and in Pennsylvania from \$8.30 to \$9.50. All these prices are necessarily given for the long or gross ton of 2,240 lb., the unit in which anthracite is sold at the mines and on which freight is paid, although in all but a few cities and towns outside of Pennsylvania the same coal is sold at retail by the short or net ton of 2,000 lb. In using this cost-to-dealer information, allowance must therefore be made on the one hand for the dealer's losses by degradation, for his cost items, and for a fair margin of profit, and, on the other, for this difference of 240 lb. in the ton used.

The Commission urges the Congress to fix a uniform standard of weight for anthracite and bituminous coal throughout the country. Bituminous coal, except in the export and tidewater business, is mined, transported and sold by the net ton of 2,000 lb. Anthracite is mined, sold at the mine, and transported by the gross ton of 2,240 lb., but is retailed in some places by the one unit and in some by the other. To guard against temporary opportunities for injustice, the change should be accompanied by the widest publicity.

Cost of Distribution.—The expense of distributing the coal is the item of cost nearest home, and yet it is an item that the consumer may overlook. The city retailer may have provided extensive storage in his coal yard or pocket and delivery trucks sufficient to meet promptly every call for immediate delivery in midwinter; the small dealer may own neither yard nor delivery equipment, simply selling from the car to the customer's own truck or a hired truck. Such a variation in service naturally involves a variation in gross margin or difference between the cost of anthracite on the dealer's siding and his price to the consumer. The field agents of this Commission have found that these margins are as high as \$3.50 or more per ton and as low as \$1, or even less. The larger service rendered to the city consumer includes unloading, storage, screening, and delivery.

In five of the larger cities examination of the books of dealers handling anthracite almost exclusively showed that the average gross margin per ton was \$2.88 in 1920; \$2.55 in 1921, and \$2.41 in 1922. The average expenses of these

dealers for these three years were \$2.39, \$2.26, and \$1.99, respectively, showing a decrease since 1920, and net margins of 49, 29, and 42c. respectively for the three years. Returns received from retailers throughout the country show that in the past five years there has been in general an increase in gross margins in the later years, amounting for some dealers to \$1 or more. Generally there also is a considerable diversity in the margins reported, due either to price competition among dealers or to the varying cost to dealers, depending on whether the coal was purchased from big companies or from independents or from jobbers. Were it not for these wide differences in wholesale prices the normal effect of competition would tend to narrow this spread of margins in the retail trade. The source of the anthracite, as determining the cost to the dealer, may have more to do with his success than the relative efficiency of his business organization. *The characteristic feature in the retailing of anthracite is the lack of uniformity in margins both within the same city and between cities.*

Of the anthracite domestic sizes 24 per cent is sold directly from mine to retailer or consumer, and 53 per cent through sales agents, and 20 per cent is handled by wholesalers, whose margins vary widely from city to city and from year to year. Reports from representative wholesalers in 5 cities showed an average margin of 23c. in November, 1921, and over 27c. in November, 1922. In these two months the high and low margins for individual companies were, in 1921, 70c. and 18c., and in 1922, \$1.40 and 6c. One feature in this wide spread is the fact that the wholesale trade has to dispose of steam sizes, sometimes at a loss, along with the more profitable domestic sizes. The trend of wholesalers' gross margins in the last three years has been downward, with a decrease of 13c. from 1920 to 1921 and a recovery of 3½c. in 1922. Nevertheless, the margins of wholesalers and retailers in recent years have been high and they have been relatively higher on domestic sizes of anthracite than on the steam sizes of anthracite or of bituminous coal, indeed it is a fairly common practice to make up on sales of domestic anthracite any losses on steam coal.

The speculative activity of the independent wholesaler in time of shortage adds to the wide spread in the prevailing prices of anthracite, and this activity may result not only in largely increased profits for individual jobbers but in pyramiding profits by multiple sales among jobbers. The Commission's study of carloads of high priced coal selected at random from shipments to New England during the past fall and winter disclosed considerable buying and selling among jobbers with consequent pyramiding of their margins, varying on different sales from 15c. to \$4.25, the amount which a Boston jobber in December, 1922, added to the \$9 mine price of a car of stove anthracite. A considerable number of sales were reported at margins from 75c. to \$1.50 a gross ton. It must not be forgotten that the jobber of this type physically handles no coal whatever; his is only a credit and bookkeeping business.

Freight Charges.—The item of freight alone in the examples cited takes from 16 to 30c. of the consumer's dollar. The question whether or not the existing freight rates on anthracite are excessive is one that comes under the jurisdiction of the Interstate Commerce Commission. The three years painstaking investigation of these rates by that body, on which its decision of July 30, 1915, was based, developed the pertinent fact that all the conditions in the transportation of anthracite—the vast quantities in trains of maximum tonnage and in cars of large capacity originating with relatively large shippers—tend toward lower operating costs. More than forty years ago President Gowen of the Philadelphia & Reading referred to this traffic as "very profitable," and in later years anthracite has been termed by the carriers their "backbone traffic." Throughout the history of the industry there has been no change in the attitude of the carriers toward this very desirable business, the active competition for which explains most of the history of combination.

As so large a part of the anthracite consumer's dollar goes as freight charges, a material reduction in the price of coal might come through a reduction of freight rates. With a keen appreciation of the public demand for the scrutiny of every item in the cost of anthracite, the Coal Commission urges upon the Interstate Commerce Commission, the duly constituted agency of the Federal Government, a re-examination of the reasonableness of anthracite freight rates. The pending separation of carriers and mining companies in the three larger systems makes opportune the reconsideration of the subject by the Interstate Commerce Commission.

Cost of Mining.—The mine price of anthracite, which is the first item of cost on the retailers books, is an item concerning which the consumer rightly desires unbiased testimony. The Commission has obtained reports on costs,

sales realizations, and margins covering the period Jan. 1, 1919, to March 31, 1923, from all but one of the important operators. (Reports covering operations of the Delaware, Lackawanna & Western R.R. Co. during part of this period have yet to be received.) By making certain allowances for differences in accounting practice these reports can be compared with returns made by the same companies to the Federal Trade Commission for the years 1917 and 1918. For twelve companies—nine railroad coal companies and three large independents shipping from 60 to 70 per cent of the total anthracite—the comparison can be carried back to 1913. The cost figures here presented for the years beginning with 1919 are those reported to the Coal Commission by the operators without revision.

The mine cost as it stands on the books of each mining company and as reported by the company represents the average cost of the total output, all sizes, of anthracite. Egg coal has, for example, at least five times the market value of barley, but these sizes are mined together and their costs cannot be separated. Mine costs directly reflect the conditions under which these deposits of coal are recovered for the use of man. Even within the few counties in which anthracite is found there is a conspicuous range of natural conditions, involving economic and even social consequences.

The distinction between the Northern, Middle, and Southern field, or, as they are also termed, the Wyoming, Lehigh, and Schuylkill regions, is primarily geologic and topographic, but the effects of the natural conditions largely control costs. The attitude of the rock beds, including the seams of anthracite, practically determines the method of mining the coal and the type of mine equipment, which in turn involve a corresponding variation in costs of mining and even in the skill of mine workers.

The contrast is great between some of the level-lying beds of moderate but fairly constant thickness under the broad Wyoming Valley, where mining and underground haulage present relatively simple problems to the engineer, and the steeply pitching or overturned and faulted beds of changing thickness in the Schuylkill field, where crushed coal and treacherous roof multiply the difficulties of mining and increase the unavoidable waste. Even more direct is the connection between geologic processes working in the past and the differences in the character of the coal as mined today, the varying proportions of large and small sizes demanding in turn differences in preparation and resulting in corresponding differences in marketing problems and in average prices realized for the product of the mines.

Waste in Mining.—The engineering staff of the Commission has carefully studied the subject of waste and has determined the proportion of the coal deposit which is lost

in the processes of mining and preparation. It is gratifying to find that while forty years ago estimates of the percentage of recovery were 27 per cent to 40 per cent, and twenty years later the Roosevelt Commission predicted that with better mining methods and the utilization of former waste material a 50 per cent recovery could be expected in the near future, the present study shows that this estimated higher recovery has been in fact exceeded, and that the practice of today in mining and preparing the coal for market yields an average recovery of about 61 per cent, the greater percentage of waste being in the Southern Field, where the steeply pitching beds of crushed coal place a natural limitation on recovery. It must be kept in mind, however, that this type of conservation engineering, which increases the percentage of recovery and adds to the expected life of the limited reserves of anthracite in the ground, may involve an increase in the cost of mining.

It is found that all the factors involved in mining costs contribute to the increase in mine prices. In the 10 years under review by the Commission's accounting staff, labor costs in the production of fresh-mined coal have risen from \$1.56 a gross ton in 1913 to \$4.12 in the first quarter of 1923, the cost of supplies from 35 to 71 cents, and general expenses from 32 to 92 cents. Labor cost bears about the same relation to total mine cost in 1923 (71.7 per cent) as in 1913 (70 per cent); supplies cost relatively less in 1923; and general expenses are relatively higher in 1923.

The total range in the average mine cost of a ton of coal with the nine railroad companies has been from \$2.23 in 1913 to \$5.75 in 1923. With three independent companies for which there are continuous cost records, the corresponding change has been from an average cost of \$2.50 in 1913 to \$6.32 in 1923. Examined in detail, the increase in mine costs for these twelve companies was moderate until 1918, when for three successive years there was an annual jump of approximately a dollar. To these increases, changes in wage rates, rising prices for supplies, and increasing charges for royalty and depletion have all contributed, and the discussion of the first and largest item, labor costs, leads to the most extensive inquiry which this Commission has undertaken, covering the living conditions of the miners' families and the earnings and other labor conditions of the mine workers.

Sociological Studies—Composition of Mining Population, Living Costs and Wage Rates

The Census of Mining Population.—The decennial Federal Census secures and publishes much valuable information regarding the population as a whole which it is not practicable to present by industries in the general census report. With the consent and the co-operation of the Director of the Census, agents of the Commission have gone to the original schedules returned by the enumerators during the census of 1920 and have taken therefrom certain information relating to the nationality, places of domicile, ages, marital status, etc., of mine workers.

The 1920 returns show 147,456 anthracite mine workers. These together with their families number approximately five hundred thousand persons. The mine workers themselves constitute about one-half of the occupied males in the communities in which the mine workers live; and they and their households together constitute about one-half of the populations of the counties in which the anthracite coal fields lie.

Of these 147,456 mine workers, 102,485 live in incorporated towns or cities of a population of 2,500 or over. The remaining 44,971 live in communities of less than 2,500 population. The census thus classified 69.5 per cent as urban and 30.5 per cent as rural. Of the urban population, 16,456, or 11.2 per cent of the total number of mine workers, live in places of 50,000 or more population; 41,526, or 28.2 per cent, in places of from 10,000 to 50,000; 30,629, or 20.8 per cent, in places of from 5,000 to 10,000; and 13,874, or 9.4 per cent, in places of from 2,500 to 5,000. The small, isolated mining community, located on the company property, unincorporated and company controlled, and not easily accessible by trolleys, such as are found in the bituminous fields, is exceptional in the anthracite field. While 98 company-controlled communities were reported less than 15,000 mine workers were living in these communities; and less than 7,000 of these were living in communities that are as much as two miles from an incorporated town of a population of 2,500 or over.

Railroad service is frequent and interurban trolleys connect up the towns in the greater part of the anthracite field. Thus approximately 90 per cent of the anthracite mine workers live in communities that are independent of the employing companies. They live just as the mass of other Americans live, in free self-

governing communities where their civic rights are within their own keeping. Comparatively few of the mine workers live in company-owned houses so that they are free to go from one mine to another to work without its having any effect on the tenure of their domicile. Very many of the mine workers live a good ways from their work and go back and forth by trolley just as workers in our cities do. It is not unusual to find them trolleying back and forth to and from their work anywhere from five to ten or twelve miles.

In connection with the study of the kinds of communities in which the mine workers live, a study was made of the extent to which they lived in company-owned houses. Reports secured from 124 out of 129 mining companies showed that 112 of these companies owned dwelling houses. The number of employees reported as on the payrolls of these 124 companies is 162,724. This number is some 15,000 greater than the number reported in the census. But the larger figure represents a date in the early part of the present year, 1923, while the census represents a period in 1920. The 112 companies out of the 124 that reported ownership of company houses represented 98 per cent of the employees of the 124 companies; and these 124 companies employed approximately 98 per cent of the total number of anthracite workers. This report on company-owned houses, therefore, covers 96 per cent of all the mine workers.

The total number of family dwellings reported by these 124 companies was 10,246; and the number of mine workers living in these company-owned dwellings was 15,486, or 9.7 per cent of the total number of mine workers employed by the 124 reporting companies. Less than 10 per cent of the total of all anthracite mine workers are thus shown to be living in company-owned dwellings. This is one of the few items in which there are any perceptible differences between the divisions of the anthracite fields, as only 5.3 per cent of the employees in Northern field are reported as living in company-owned houses as against 15.8 per cent in the Central and Southern fields taken together. Of the 10,246 company-owned dwellings, 3,156 (housing 4,696 mine workers) are located in incorporated places of 2,500 or more population.

Of the 147,456 mine workers reported by the 1920 census, 2,039, or 1.4 per cent were under 16 years of age; 3,690, or 5.9 per cent were sixteen or seventeen years of age; 7,974, or 5.4 per cent, were eighteen or nineteen years of age; 17,393, or 11.8 per cent were from 20 to 25 years; 39,334, or 26.7 per cent, were from 25 to 35 years; 35,413, or 24 per cent, were from 35 to 45 years; 23,994 or 16.3 per cent, were from 45 to 55 years; 9,825, or 6.7 per cent, were from 55 to 65 years; and 2,660, or 1.8 per cent, were 65 years of age or over. The age of the remaining 134 was reported as unknown.

Nationality and Citizenship.—Of the mine workers reported by the 1920 census, 69,645 were native-born whites, 46 were native-

born colored, while 77,765 were foreign born. Thus 47.3 per cent of the total number of mine workers were native born as against 52.7 per cent foreign born. Of this 77,765 foreign born, 26,562, or 18 per cent of the total number of mine workers, were born in Poland; 15,450, or 10.5 per cent were born in Russia; 9,645, or 6.5 per cent, in Italy; 8,333, or 5.7 per cent, in Austria; 7,356, or 5 per cent, in the British Isles; 5,330, or 3.6 per cent, in Slovakia; 1,700, or 1.2 per cent, in Hungary; 1,286, or 0.9 per cent, in Germany; the remaining 2,103, or 1.4 per cent of the total mine workers, were born in countries other than given above. Approximately 42,000, or 28.5 per cent of all the mine workers reported in the census, were of Polish or of Russian birth; and of the total foreign born, approximately 55 per cent have been furnished by these two countries.

Of the 77,765 foreign-born mine workers, only 431, or 0.6 per cent had been in the United States less than five years at the time of the 1920 census; 14,275, or 18.4 per cent had been here from five years up to ten; 17,330, or 22.3 per cent, had been here from ten to fifteen years; 16,007, or 20.6 per cent had been here from fifteen to twenty years; 27,620, or 35.5 per cent, had been here twenty years or over; while the years of residence of 2,102, or 2.7 per cent, is reported as unknown. These figures indicate that for the three five-year periods from 1900 to 1915 there was a steady and fairly uniform flow of foreign-born workers into the anthracite fields. In the five-year period from 1915 to 1920 there was an almost complete cessation of this flow as well as an exodus from these fields.

Of the above-described foreign-born mine workers, 31,446, or 40.4 per cent, had become naturalized by 1920; 10,483, or 13.5 per cent, had taken out first papers; while 34,322, or 44.1 per cent, had remained alien, not having even made a declaration of intention to become citizens. These percentages are based on the total number of foreign-born mine workers reported by the census, while the age figures of mine workers show that 10,729, or 7.3 per cent of the total number, were under eighteen years of age, there are only 996 foreign-born mine workers in the group under eighteen. Formal declaration of intention to become a citizen can be made at the age of eighteen, although naturalization cannot be obtained before twenty-one. The foreign born under eighteen should, therefore, be disregarded in computing the percentage of naturalization figures. But making allowance for those under eighteen years, the percentage of foreign born who have remained completely alien would remain approximately 44 per cent.

Of the 69,691 mine workers born in the United States, 98.9 per cent can read and write. Of the 7,431 born in the British Isles, 95.4 per cent can read and write; while of the 70,334 born in countries other than those given, 45,477, or 64.7 per cent, can read and write, 2,319, or 3.3 per cent, can read but not write, and 22,538, or 32 per cent, can neither read nor write. Further, 9,824, or 14 per cent of those born in countries other than the United States and the British Isles, do not speak English. When it is remembered that 99.4 per cent of the mine workers had been in the United States five years or more, this appears a high percentage unable to speak English; and this fact takes on an added significance when we consider the hazardous nature of the occupations in which they are engaged. Over 22,500 of the foreign born cannot read any language, so that safety notices or instructions would be meaningless to them; and nearly 10,000 of them cannot speak English and would have difficulty in understanding their foremen unless these spoke their particular language. These figures suggest, therefore that there has been remissness somewhere in the matter of teaching the foreign born the language of the country, just as there appears also a lack of energy on the part of the various organizations that might properly be looked to in the matter of stimulating their interest in acquiring American citizenship.

Social Status.—Of the total mine workers reported by the census, 83,877 were maintaining homes. Of the 69,691 native born, 30,605, or 43.9 per cent, were maintaining homes; of the 77,765 foreign born, 53,272, or 68.5 per cent, were maintaining homes. A very much larger percentage of the foreign born are maintaining independent homes than of the native born.

TABLE I—MARITAL AND DOMICILE STATUS OF THE TWO GROUPS MAINTAINING HOMES

	Native born—		Foreign born—	
	No.	Per cent	No.	Per cent
Single.....	2,345	7.7	581	1.1
Married, wife present....	27,213	88.9	51,103	95.9
Married, wife not present....	178	.6	364	.7
Widowed or divorced....	850	2.8	1,212	2.3
Marital status unknown....	19	12

TABLE II—MARITAL AND DOMICILE STATUS OF 63,579 MINE WORKERS NOT MAINTAINING SEPARATE HOMES.

	Native born—		Foreign born—	
	No.	Per cent	No.	Per cent
Total boarding with family.....	30,390	3,702
Single.....	29,632	97.5	3,579	96.7
Married, wife present....	84	.3	4	.1
Married, wife not present	313	1.	56	1.5
Widowed or divorced....	170	.6	40	1.1
Marital status unknown	191	.6	23	.6
Total boarding with a family other than their own....	8,696	20,791
Single.....	5,671	65.2	12,770	61.4
Married, wife present....	1,681	19.4	935	4.5
Married, wife not present	453	5.2	5,590	26.9
Widowed or divorced....	868	9.9	1,414	6.8
Marital status unknown	23	.3	82	.4

Out of 39,086 native-born workers who are not maintaining homes, 30,390 are boarding with a family of which they are a part; while out of 24,493 foreign-born workers who are not maintaining homes only 3,702 are boarding with such family.

Of the 83,877 mine workers who maintain homes, 27,142, or 32.4 per cent, own their homes. Of this number, 8,734 are native born and 18,408 are foreign born. Of the native born who maintain homes, 28.8 per cent own their homes; of the foreign born who maintain homes, 34.5 per cent own their homes. Of the homes owned, 64.5 per cent are free of mortgages, and this percentage applies approximately alike to both native and foreign born.

TABLE III—PERCENTAGE OF FAMILIES MAINTAINING HOMES AND NUMBER OF CHILDREN

	Total Maintaining Homes	Percentage of mine-workers maintaining homes who have specified number of children							
		None	One	Two	Three	Four	Five	Six	Seven or Over
Native and foreign born	83,877	13.1	14.4	16.8	15.9	13.4	10.6	7.4	4.3
Native born..	30,605	19.	20.2	19.2	14.6	10.3	7.3	4.6	2.5
Foreign born..	53,272	9.7	11.1	15.4	16.6	15.2	12.5	9.	5.4

As shown above, there are 30,605 native-born mine workers who maintain homes. In 62.4 per cent of the families maintained in these homes there is only one member gainfully employed, that is engaged in an occupation from which he secures a money return; in 22.6 per cent of these families there are two members gainfully employed; in 8.8 per cent there are three members so employed; in the remaining 6.2 per cent there are four or more members gainfully employed. In 50.8 per cent of the families of the 53,272 foreign-born workers who maintain homes there is only one member gainfully employed; in 28.8 per cent there are two such members; in 11.6 per cent there are three, and in the remaining 7.8 per cent there are four or more members gainfully employed. These figures show a marked difference between the native and foreign born, as nearly two-thirds of the families maintained in homes by native-born mine workers are supported by the work of a single breadwinner while this is the case in only one-half of the families maintained in homes by the foreign-born mine workers.

In a very considerable number of cases the additional worker in the family aside from the father is the mother. As already shown, of the families maintained in homes by 30,605 native-born mine workers, there are 11,497 in which there were two or more members gainfully employed. But it also develops that the wives of 4,405 native-born mine workers who maintain homes are gainfully employed as well as their husbands. This leaves 7,092 families of native-born mine workers whose support is contributed to by members other than the father and mother. Of the families maintained in homes by the 53,272 foreign-born mine workers, there are 26,187 in which two or more members are gainfully employed. In 12,138 of these families the wife of the mine worker is reported as gainfully employed as well as the husband, leaving 14,049 families maintained in homes by foreign-born mine workers to the support of which a member other than the father or mother contributes.

There are 27,144 native-born mine workers who maintain homes with the wife present, and 83.8 per cent of these homes the wife is not employed in any gainful occupation. Of the 16.2 per cent of wives who are reported as gainfully employed all except 109, or 0.4 per cent, are employed in work within their own homes. The occupations of the 109 require them to go out from their homes to other places of work.

There are 51,041 foreign-born mine workers who maintain homes with the wife present and in 76.2 per cent of these homes the wife is reported as not employed in gainful occupation. As in the case of native-born workers, practically all of the wives of these foreign-born workers who are reported as gainfully employed are so employed within their own homes. Of the 23.8 per cent of the wives reported gainfully employed only 159, or 0.3 per cent, are reported as in occupations that take them out of their homes.

Of the 30,605 homes maintained by native-born mine workers, boarders or lodgers were taken in 4,955, or 16.2 per cent. Of the 53,272 homes maintained by foreign-born workers boarders or lodgers were taken in 12,308, or 23.1 per cent. Of these families taking boarders or lodgers, 58 per cent of the native born and 53 per cent of the foreign born took only one such boarder or lodger; 23.5 per cent of the native born and 26.7 per cent of the foreign born took two; 10.8 per cent of the native born and 11.2 per cent of the foreign born took three, and 7.7 per cent of the native born and 9 per cent of the foreign born took four or more boarders or lodgers.

Cost of Living.—In order to measure wages against cost of living in the anthracite fields an investigation was made of the principal items of expense in mine workers' families.

A list of the food supplies purchased by 550 families for six months last winter (October-March) was obtained from storekeepers' records, and prices of foods on Dec. 15, 1922, were secured from 83 stores patronized by the families of 16,469 mine workers, numbering approximately 100,000 people. The lowest prices were found in the cities of 2,500-10,000 population; the highest in the small mining village, with the cities of Wilkes-Barre and Scranton not far behind. In the small village the winter's supply of food cost 2 per cent more than in the two large anthracite cities; in the towns of 10,000-50,000 it cost 3 per cent less, and in the smaller towns of 2,500-10,000 it cost 4 per cent less.

Compared with prices in Philadelphia and Pittsburgh, as collected for the same date by the U. S. Bureau of Labor Statistics at stores located among wage-earning population, it was found that it cost something like 10 per cent more in Scranton and Wilkes-Barre than in Philadelphia; 11.4 per cent more than in Pittsburgh; and that in the group of anthracite towns where the prices were lowest they were 3½ per cent higher than in Philadelphia, and 4.8 per cent higher than in Pittsburgh.

It is not practicable to compare the cost of clothing, furniture and similar items in the same way, because of the difficulty of finding identical articles in different places.

It was discovered, however, that retail dealers in the smaller mining villages allowed for higher gross margins in fixing prices than are usually allowed, for example by merchants in Washington, on many items of wearing apparel, notably men's shoes, men's underwear and goods sold by the yard.

Rent ranks next to food and clothing in the expenditures of the anthracite miner's family. Among the 712 families whose budgets were secured, those paying rent in Scranton and Wilkes-Barre paid on the average \$14.71 per month; those in cities of 10,000-50,000 paid \$14.39, whereas families in cities of 2,500-10,000 paid \$11.36. The rent for company-owned houses was always less than for others, the average paid being \$5.57. A comparison of rentals, even in the same region, is difficult, because so much depends on the location, the equipment and the state of repair of the particular house. The prevailing type of dwelling occupied by anthracite-mine workers is a two-story frame detached house of five or six rooms. Such a house with running water in the kitchen and electricity will rent for \$20 if favorably located and in good repair, while one of the same description located on the flats may rent for only \$10.

Excluding families living in company houses, the prevailing rent in Scranton and in the towns of 2,500-10,000 population was \$10 and \$12; in the cities of 10,000-50,000 it was \$15. These rents are for houses without a bathroom, to secure which adds approximately \$5 a month to the rent, aside from the extra cost of the water connection. As a matter of fact, however, a bathroom is the exception in the houses offered for rent in the anthracite region, and even if a miner wishes to meet the additional expense he would at present have difficulty in finding a house with it.

In the purchase of coal the mine worker's family had an advantage. The average price paid by them for chestnut coal delivered in Scranton in December, 1922, was \$7.30, and it averaged \$6.71 per ton in cities of from 2,500 to 10,000 population.

Taxes were found to be an appreciable amount in the family expenses of the mine worker. Every adult person in the anthracite region pays a direct tax. An occupational tax must be paid by every miner and a school tax by both the miner and his wife, whether or not they own property. Among the families studied taxes represented about 2 per cent of total expenses.

These topics and others connected with the cost of living are discussed more fully in an appendix to this report, but a summary table is included here, showing the principal items of expense last winter in the budgets of the 712 families interviewed by agents of the Commission. The budgets covered the six months beginning Oct. 1, 1922. In the table the 712 families are divided into four groups, according to the amount of income.

TABLE IV—MONTHLY DISBURSEMENTS OF ANTHRACITE MINE WORKERS' FAMILIES DISTRIBUTED ACCORDING TO INCOME OF FAMILIES

Expenses:	Family Income Less Than \$100		Family Income \$100 and Under \$150		Family Income \$150 and Under \$200		Family Income \$200 and Over	
	No. Families	per Disbursed Family	No. Families	per Disbursed Family	No. Families	per Disbursed Family	No. Families	per Disbursed Family
Rent.....	37	\$13.24	152	\$13.51	160	\$13.06	74	\$14.60

The income as well as the expenses of the 712 families interviewed by the agents of the Commission was secured from the mine worker or his wife and the wages of the mine workers were checked against the payroll. The chief wage earner in every family was employed in the mines. In 33 per cent of these families he was a contract miner; in 34 per cent he was a company miner or a skilled or semi-skilled day worker; in 33 per cent of the families he was classified as a laborer. These proportions are approximately the same as they are in the total body of mine workers. Sixty per cent of the mine workers in these families worked the entire 26 weeks covered by the study; 20 per cent worked from 22 to 26 weeks, and only 23, or approximately 3 per cent, were employed in the mines for less than half of the period. The lack of employment was due in large part to the failure of certain mines to reopen when the strike was ended because of the "cave-in" law which was then being contested in the courts and which has since been annulled.

The prevailing household was one of six members—usually four children with the father and the mother, but sometimes three children and an adult relative or a boarder. Half the families

were dependent entirely on the father's earnings in or about the mines, while the other half had some additional income either from boarders or from earnings outside the home by other members of the family. About a quarter took boarders. The custom of turning the weekly pay envelope over to the mother prevailed in most of the families, and in all but a few cases, therefore, the earnings of the various members of the family were spent or distributed by her for the benefit of the family as a whole.

Exclusive of families living in company-owned "patches," one in every ten families owned a house other than the one occupied and secured some income—about \$15 a month—from rentals.

Taken together, the families depended for 80 per cent of their income on the father's earnings; 11 per cent was added by other members of the family earning outside the home; 8 per cent was secured by the mother through keeping boarders, and 1 per cent came from investments.

The average income from all sources was approximately \$176 per month; 41 per cent had as much as this or more; 59 per cent had less. Nine families, or 1.2 per cent of the total families visited, had an average monthly income during the six months of less than \$75; forty-seven families, or 6.6 per cent, had from \$75 to \$100; ninety-nine families, or 14 per cent, had from \$100 to \$125; one hundred and twenty-seven, or 17.8 per cent, had from \$125 to \$150; one hundred and thirty-seven, or 19.2 per cent had from \$150 to \$175; one hundred, or 14.1 per cent had from \$175 to \$200; and one hundred and ninety-three, or 27.1 per cent, had \$200 or over.

Occupational Names.—To facilitate understanding of the labor sections of this report an explanation is given of terms peculiar to the anthracite industry. Pick and machine miners, together with their assistants, are paid on a piece-rate basis and are what would be termed in other industries *piece workers*. In this report they are referred to as either *contract men* or *tonnage men*. While some contract miners are paid by the *car* and others by the *yard*, instead of by the *ton*, they are all grouped together under the term *tonnage men*. Every colliery has some miners, employed in various kinds of work, who are paid by the hour and not by the piece. These are called *company miners*, and are included under day workers, and not under *tonnage* or *contract men*.

There is a third class of miners, between the contract miner and the company miner. These are contract miners who because of abnormal conditions in their working places have been placed temporarily on a day rate, usually somewhat above the day rate of company miners. The rates at which they are paid are known locally as *consideration* rates and these miners are called *consideration miners* during the time they are on the day rate. But as ordinarily they are on a day rate for a comparatively short time and go back to their contract rates as soon as conditions in their working place become normal, their earnings on the whole represent the earnings of piece workers rather than day workers. In the tables, therefore, they have been grouped with contract miners.

Most miners employ a *laborer* who is an employee of the miner and not of the company. These *laborers* load the coal blasted down by the miner, assist him in his work and are employed, disciplined or dismissed by the miner. They usually are paid a percentage of the miner's earnings. The miner turns in a statement of the amount due his laborer and this amount is deducted by the company from the miner's earnings and paid to the laborer directly by the company. The miner's laborers are piece workers and are included under the general term *contract men* or *tonnage men*. Practically all the other employees around the mines are paid by the day or hour and are, therefore, time workers. These time workers are referred to sometimes as *day men* but more frequently as *company men*.

All contract men, or *tonnage men*, are underground workers. *Company men*, or *day men*, are subdivided into *inside men* and *outside men*, according to whether their working places are underground or on the surface.

Development of Wage Rates.—From the standpoint of industrial relations, and for an understanding of the present structure of wage rates in the anthracite industry as well as the relation of these rates to changing living conditions, it is necessary to take the award of the Anthracite Coal Strike Commission in 1903 as dividing the history of wage making into two distinct periods.

The labor organizations that had been a strong factor in the industry in the seventies had disappeared by 1880, and the steady inflow of widely differing races from Europe, beginning at this time, made any immediate reorganization of the wage earners practically impossible. For the twenty years prior to 1900 therefore, contract rates, wage rates and conditions of employment were determined not by collective bargaining but by the individual employee seeking employment pitted against the individual management. The industry was demoralized by an oversupply of labor and by an overdevelopment of the mines, with the result of both a low wage rate and a limited opportunity for work.

In the five years ending 1895 the mines had averaged only 197 working days per year, and in the five-year period ending 1900 had averaged only 160 days. Thus, in the first period they had worked less than two-thirds of the working days of a year, and in the second barely more than one-half. But this does not mean that the collieries worked this number of days consecutively and that the employees were accordingly free to find other employment the rest of the year. The starts made by collieries were generally scattered throughout the year, a few days in one week, a few in another, just as is the case in much of the bituminous field at the present time. Even when the whistle called the mine workers to the colliery to begin a day they could not assume that it meant a full day's work.

Figures published in the report of the Anthracite Strike Commission reflect the situation for the year 1901, in which the anthracite mines together average 196 working days. One of the large companies, in its colliery that made the best showing, reported 288 starts within the year; but all starts taken together equalled only 232 full ten-hour days. In another colliery making 286 starts the total time represented by these starts equalled only 178 ten-hour days. In another instance a colliery making 227 starts worked only the equivalent of 102 ten-hour days. Under such conditions it was inevitable that the wage structure which had grown up during the twenty years prior to 1900 should be more or less haphazard and that the differentials between collieries for the same occupations and within a colliery as between different occupations should be somewhat erratic.

A partial organization of the anthracite workers was effected by the United Mine Workers by 1900 and a strike in that year resulted in a 10-per cent increase for all mine workers, but left the wage structure and working conditions otherwise unchanged. The Anthracite Coal Strike Commission, appointed in October, 1902, as a result of the nearly six months strike of that year, handed down an award fixing wage rates and working conditions for a period of three years from April 1, 1903. Special provisions were made for certain limited classes of employees, but the great bulk of the mine workers came under one or the other of two general provisions of the Award. Contract miners and their laborers secured a flat increase of 10 per cent in their rates. Company men, not covered in the special provisions, were given a nine-hour day with the same wages for the nine hours that they had been receiving for their former ten-hour day.

The award also provided for a sliding scale giving to all classes of workers a further increase of 1 per cent on their rates for each 5c. increase above \$4.50 in the selling price of prepared sizes of coal at New York harbor. This sliding scale gave an average increase of approximately 45 per cent during the nine years it continued in existence. The award represented an actual increase in earnings of contract miners and their laborers, if they could send out as many cars of coal in the nine hours as they had sent out in ten hours; and many, if not most of them did. But while the provision of the award reducing the company men's day from ten to nine hours gave these employees an increase of 11 per cent in their hourly rates, it gave them no actual increase in earnings if they worked no more days per year than they had been working. It merely allowed them to earn in nine hours the same amount that they had formerly earned in ten.

In 1906, after a suspension of nearly five weeks, an agreement was reached to continue the award of the commission in effect without change for another three-year period. Again in 1909 the award was continued for another three-year period with a few changes which, however, did not affect either wages or hours. In 1912, after a suspension of over five weeks, an agreement was entered into for four years which gave an increase of 10 per cent to all classes of employees, but as this agreement also abolished the sliding scale under which the mine workers had secured approximately 4.5 per cent, their net increase was around 5½ per cent.

In 1916 a new agreement was entered into running for another four years and expiring March 31, 1920. This agreement gave to the great bulk of the company men an eight-hour day, with the same wages as they had been receiving for nine hours, and gave an increase of 3 per cent on top of this. To certain other company men who received no reduction of hours it gave an increase of 7 per cent, and it gave an increase of 7 per cent to contract workers. The increase to the day workers who had received a reduction in hours from nine to eight, plus 3 per cent, was an increase of approximately 16 per cent in their hourly rates, but it was an increase of only 3 per cent in their actual earnings per day. As in the case of the award of the commission in 1902, the reduction in hours gave no actual increase in a day's earnings but allowed company men to earn in a day shortened by one hour the same amount they had earned in their longer day.

Although this agreement ran to March 31, 1920, the rapid and unprecedented increase in the cost of living brought on by our entrance into the war, and the difficulty of maintaining an adequate force of mine workers in the face of wages being paid in outside industries, led the parties to the agreement, in conference with the Federal Fuel Administrator [sic] to enter into a supplementary agreement effective May 1, 1917, which gave increases to all classes of workers.

The effects of this series of agreements may be summarized in terms of the increase per dollar of earnings which they brought to the different classes of mine workers. For the contract miner and his laborer, assuming that they were able to send out as many cars of coal in the eight- and nine-hour day as they did in the ten-hour day, the dollar of earnings of April 1, 1902, was increased by the award of the commission of 1903 to approximately \$1.15; by the agreement of 1912 to \$1.21, and by the agreement of 1916 to approximately \$1.30; a total increase of 30 per cent.

For the company men, or day men, the effect of these increases is very different, according to whether we consider their hourly rates or their day's earnings. The effect on the hourly rates was to increase the dollar of 1902 to \$1.16 in 1903, \$1.22 in 1912 and \$1.42 in 1916—a total increase of 42 per cent as compared with the increase of 30 per cent for contract miners and their laborers. But this 42 per cent increase in the hourly rate of company men was not necessarily reflected by any means in their actual earnings.

The reduction in hours given them in 1902 and again in 1912 gave no actual increase in a day's earnings, so that the increase in earning power of company men from 1902 up to May, 1917, would have been only 13.3 per cent if the mines had continued to work the same number of days as they worked in 1902 and 1903. There was, however, a considerable increase in the number of days worked per year in 1916 and thereafter as compared with the period prior to 1903. The number of days worked by all the anthracite mines in the five-year period ending in 1902 averaged 167 per year, while in the five-year period prior to 1917 the average was 243 days. The economic conditions of the mine workers had been bettered between 1902 and 1917 by this increase in their opportunity to work more than it was by increases in rates.

The supplementary agreement of May 1, 1917, gave increases in rates to all classes of mine workers. Another supplemental agreement in November, 1917, gave new increases; a third in November, 1918, gave still further increases, and an agreement in September, 1919, continued these increases in effect until March 31, 1920. The agreement of November, 1918, gave to contract workers an increase of 40 per cent and to various classes of company men increases of \$1.80, \$2 and \$2.20, respectively, over their rates as fixed in the agreement of May, 1916.

On March 31, 1920, the operators and mine workers had been unable to agree upon a new contract to replace the one expiring on that date. Fruitless negotiations were continued until June 1, when it was mutually agreed to submit the matters in controversy to a commission appointed by President Wilson. On Sept. 2, 1920, the operators and mine workers entered into a new agreement incorporating the award of this commission, this contract being retroactive to April 1.

The outstanding increases given in this 1920 contract are as follows: Contract miners were given an increase of 65 per cent over the rates established by the agreement of May 5, 1916. All increases of \$1.80, \$2 and \$2.20 per day granted to the different classes of day workers respectively by the supplemental agreements made during the war period were retained. To the new rates made up by the addition of these respective increases to the rates of 1916 a further increase of 17 per cent was added. Another provision of the contract fixed a minimum wage of 52½c. per hour for all company men whose rate under the agreement of May 5, 1916, was \$1.54½ or more per day, thus fixing a minimum of \$4.20 per day for those covered by this provision. The hourly rate of company men receiving less than \$1.54½ per day under the agreement of May 5, 1916, was increased 4c. per hour.

This agreement ran until March 31, 1922. After a five months' suspension, beginning April 1, 1922, it was continued in effect until Aug. 31, 1923.

The actual wage rates in effect for company men during March, 1923, were secured for 53,159 company men from 180 collieries distributed through the three anthracite fields. Of these, 24,087 were outside men and 29,072 inside men. All weekly or daily rates reported were, for purposes of comparison reduced to an hourly basis. While there is a very wide range in these rates—from 23c. an hour to \$1.11 an hour—the real range is between 27 and 71c. per hour, only one employee being reported as below 27c. and only 977 above 71c. Of these above 71c., only 26 are above 89c. These 53,158 workers fall into four groups as follows:

TABLE V—NUMBER OF ANTHRACITE MINE WORKERS RECEIVING SPECIFIED RATES PER HOUR.

	27c. to 39c.	39c. to 51c.	51c. to 71c.	71c. and over	Total
Outside Employees	4002	286	19,193	515	24,086
Inside Employees	921	106	27,583	462	29,072
	5013	392	46,776	977	53,158

The great bulk of them—88 per cent—receive 51-75c. per hour. Of the 5,405 who receive less than 51c.—approximately 10 per cent—at least 4,133 are boys, including about 3,000 slate pickers who work in the breaker above ground, and about 800 door boys underground who open and close the doors of the haulageways. Of the adult employees, therefore, approximately 95 per cent receive hourly rates between 51 and 71c. per hour. As most of these employees are on an eight-hour day, their daily rate is \$4.08-\$5.68.

In further analysis of the rates of these 46,595 adult employees, they are subdivided in the following tables, first into ten groups and then into five:

TABLE VI—NUMBER OF ADULT ANTHRACITE MINE WORKERS RECEIVING CERTAIN SPECIFIED RATES PER HOUR

	51c. to 53c.	53c. to 55c.	55c. to 57c.	57c. to 59c.	59c. to 61c.	61c. to 63c.
Outside.....	8597	1752	1770	990	1875	996
Inside.....	307	823	2418	1751	5394	7498
Total.....	8904	2575	4188	2741	7269	8494
	63c. to 65c.	65c. to 67c.	67c. to 69c.	69c. to 71c.	Total	
Outside.....	736	1069	1044	297	19126	
Inside.....	2134	2560	3478	1106	27469	
Total.....	2870	3629	4522	1403	46595	
	51c. to 55c.	55c. to 59c.	59c. to 63c.	63c. to 67c.	67c. to 71c.	Total
Outside.....	10349	2760	2871	1805	1341	
Inside.....	1130	4169	12892	4694	4584	
Total.....	11479	6929	15763	6499	5925	

To summarize: 24 per cent of the adult employees paid by the hour receive 51-54c. per hour; 15 per cent, 55-58c. per hour; 34 per cent 59-62c. per hour, and 13 per cent, 67-71c. per hour.

The appendix shows rates by specified occupations in considerable detail. The above figures have grouped employees together regardless of occupation, merely for the purpose of showing the opportunity for earning afforded by the anthracite industry irrespective of the particular name by which a worker's occupation may be called. Many of the occupations are peculiar to mining and no valuable purpose would be accomplished by enumerating them here. But for purposes of comparison it may be well to refer to some of the occupations that are found in outside industries as well as in anthracite mines.

For 101 blacksmiths working underground, for example, the rates range from 61 to 81c. per hour, 70 per cent falling between 65 and 69c. Of 448 blacksmiths working above ground, 258 received from 65 to 69c. Of 67 carpenters working underground, 50 received from 67 to 71c., of 1,762 carpenters working above ground, 86 received from 51 to 59c., 314 from 59 to 63c., 634 from 63 to 67c., 609 from 67 to 71c., and the remainder, 71c. and over. Of 126 electricians working underground 57 received under 63c. per hour, and 69 over that rate. Of 110 electricians working outside, 11 received under 59c. per hour, 83 between 60 and 71c., and the remaining 16, 71c. and over. Of 1,861 firemen, 117 received less than 57c. per hour, 1,394 from 57 to 61c. an hour, 289 from 61 to

65c. an hour, and the remaining 61, 65c. an hour and over. Of 628 outside machinists, 35 received less than 55c. an hour, 129 from 55 to 59c., 149 from 59 to 63c., 158 from 63 to 67c., 113 from 67 to 71c., 20 from 71 to 75c., while the remaining 24 received 75c. and over. Of 2,530 men classified as laborers working underground, 28 received less than 51c. per hour, 96 from 51 to 55c., 343 from 55 to 59c., 1,914 from 59 to 63c., 130 from 63 to 67c., 19 from 67 to 71c. Of 4,001 outside laborers, 26 received less than 51c., 3,801 received between 51 and 55c., 135 between 55 and 59c., 39 received 59c. and over.

To show the actual rates being paid to certain representative groups of employees as well as the change in these rates from 1903 to the present time, tables are given below for outside laborers and for company miners at different collieries. The first two columns give the actual hourly rates paid April 1, 1903, and 1923. Thus in the first table, covering outside laborers, the hourly rate fixed by the award of the commission in colliery No. 1 was 16½c. per hour. The various increases granted by the successive agreements have brought this up to the present rate of 52½c. per hour. The second set of columns show relative rates, on the base of the rate fixed in 1903. Thus, if we take the rate of outside labor shown for colliery No. 1 as being the equivalent of 100 on April 1, 1902, the rate under the agreement of 1912 was equivalent to 110 and the present rate to 318, indicating a total increase of 218 per cent.

TALBE VII—RELATIVE RATES OF PAY FOR OUTSIDE LABORERS (a) IN THE ANTHRACITE FIELD, 1903, 1912, 1923 (1903=100)

No. of Operation	Hourly Rates		Relative Rates		
	1903	1923	April 1, 1903	May 20, 1912	April 1, 1923
1	.165	.525	100	110	318
2	.170	.525	100	110	309
4	.180	.532	100	110	296
5	.150	.381	100	110	254
9	.160	.525	100	110	328
	.170	.525	100	103	238
	.180	.525	100	110	309
	.200	.562	100	110	281
23	.171	.525	100	110	307
	.183	.536	100	110	293
42	.130	.525	100	110	404
	.143	.525	100	110	367
62	.178	.532	100	111	299
64	.163	.525	100	110	322

(a) Stripping operation laborers not included.

TABLE VIII—RELATIVE RATES OF PAY FOR COMPANY MINERS IN THE ANTHRACITE FIELD, 1903, 1912, 1923 (1903=100)

No. of Operation	Hourly Rates		Relative Rates		
	1903	1923	April 1, 1903	May 20, 1912	April 1, 1923
1	.235	.643	100	110	274
2	.235	.643	100	110	274
10	.245	.658	100	110	269
11	.230	.636	100	110	277
23	.266	.689	100	110	259
28	.222	.664	100	113	299
42	.252	.668	100	110	265
58	.258	.678	100	110	263
64	.244	.656	100	110	269

While it is not practicable to show the actual rates paid contract miners because of the wide variety in these rates and of the differing bases on which they rest in different collieries, a table is appended showing the relative rates of contract miners. The rates of 1902 are taken as 100. The increases granted by the various awards are then applied to this basis up to and including the agreement now in effect. The various agreements have made the relative rate of 1923 213.6 as compared with base rate of 100 in 1902.

TABLE IX—RELATIVE WAGE RATES OF ANTHRACITE CONTRACT MINERS*

(April 1, 1902=100)		
1902	100.0	121.0
1903	114.4	121.0
1904	114.8	129.5
1905	114.3	142.5
1906	114.9	161.9
1907	114.2	181.3
1908	114.4	181.3
1909	114.5	213.6
1910	114.4	213.6
1911	115.0	213.6
1912	121.0	213.6
1913	121.0	

*Relative numbers for years 1903 to 1911 inclusive are based on the increase granted by the Award and the average annual increases resulting from the operation of the sliding scale.

Opportunities for Employment in Anthracite Mines.—

The improvement in the economic condition of the anthracite mine worker is not fully reflected by the increases in contract and wage rates. A further and much more important increase in his earning power is due to the increased opportunities afforded him to work. The following table shows the average days worked by anthracite mines from 1890 to 1921, both years included.

As concerns regularity of employment, the condition in the anthracite industry from 1890 to 1903 was very similar to the present demoralized conditions in the bituminous field. Only twice in those fourteen years—and those were the first two years of this period—did the number of working days average as many as 200. After 1891 the average went down, until in 1897 it was only 150, less than half the full working year, and it did not reach 200 again until 1903.

TABLE X—AVERAGE DAYS WORKED BY ANTHRACITE MINES 1890—1921

(Based on statistics of the U. S. Geological Survey)

Year	Days worked	Year	Days worked	Year	Days worked	Year	Days worked
1890	200	1900	166	1910	229	1920	271
1891	203	1901	196	1911	246	1921	271
1892	198	1902	(a) 116	1912	231		
1893	197	1903	206	1913	257		
1894	190	1904	200	1914	245		
1895	196	1905	215	1915	230		
1896	174	1906	195	1916	253		
1897	150	1907	220	1917	285		
1898	152	1908	200	1918	293		
1899	173	1909	(b)	1919	266		
Average	183	Average	190	Average	254		

(a) Strike

(b) Not available.

Dividing the table into five periods beginning with 1901, we find that in the first period the average was 197 days, or less than two-thirds of a full year; in the second, ending in 1900, only 163 days, little over half a year. In the next period although this included the strike of several months in 1902, it was 186 days; and in the period ending 1910, with figures for one year missing, 211. In the next period ending 1915, it rose to 248 days, and for the six years ending with 1921 it was 273, approximately 90 per cent of a full working year. The average number of days for all the mines in 1921 was 271 days; and approximately 40 per cent of the employees worked in mines that operated 290 days or over.

The following table shows the percentage of employees who had opportunity to work a specified number of days in the year 1921:

TABLE XI—PER CENT OF ANTHRACITE EMPLOYEES IN COLLIERIES OR WASHERIES WHICH WORKED EACH SPECIFIED NUMBER OF FULL-TIME DAYS IN 1921.

(Based on operator's annual reports to the U. S. Geological Survey)

Days worked by colliery or washery	Cumulative Per cent of all Anthracite employees	Days worked by colliery or washery	Cumulative Per cent of all Anthracite employees
300	6.1	200 or over	94.6
290 or over	40.3	180 or over	95.9
280 or over	59.4	160 or over	96.2
270 or over	67.3	140 or over	97.2
260 or over	76.8	120 or over	97.5
250 or over	87.5	100 or over	98.0
240 or over	90.4	80 or over	98.0
230 or over	91.9	60 or over	98.4
220 or over	92.6	40 or over	(a) 100.0
210 or over	93.1		

(a) The number employed on operations working less than 40 days was only 28, or one-sixteenth of one per cent.

TABLE XII—CLASSIFICATION OF EARNINGS FOR CONTRACT AND CONSIDERATION MINERS SHOWING AVERAGE STARTS PER MAN AND NUMBER OF MEN FOR THE ANTHRACITE INDUSTRY IN 1921

Earnings	Average Starts per Man	Number of Men
Under \$100	8	9162
\$100 and under 200	26	4563
200 and under 300	41	3605
300 and under 400	55	3070
400 and under 500	70	2560
500 and under 600	83	2648
600 and under 700	94	2495
700 and under 800	106	2002
800 and under 900	121	1760
900 and under 1000	138	1535
1000 and under 1100	154	1351
1100 and under 1200	172	1415
1200 and under 1300	189	1425
1300 and under 1400	204	1534
1400 and under 1500	217	1763
1500 and under 1600	231	1928
1600 and under 1700	238	2136
1700 and under 1800	246	2362
1800 and under 1900	249	2379
1900 and under 2000	254	2353
2000 and under 2100	257	2253
2100 and under 2200	259	1903
2200 and under 2300	261	1719
2300 and under 2400	263	1331
2400 and under 2500	265	1199
2500 and under 2600	266	856
2600 and under 2700	268	633
2700 and under 2800	271	524
2800 and under 2900	272	394
2900 and under 3000	272	282

Earnings of Anthracite Mine Workers Classified by Main Occupations

Earnings.—In the preceding pages the *rates* of wages for employees paid by the day or the hour have been given in considerable detail. When an hourly rate is given it is possible to compute what can be earned in a day of given length and to compare the rate with rates for the same occupation in other collieries or in other industries. It is not practicable to give a similar statement of *rates* for contract miners. They vary widely, not only between different collieries but also between different sections of the same colliery, as they are determined by the varying conditions in the veins in which miners are working. The base upon which the rate is fixed varies also, in some instances being by the ton, in others by the car, and in still other instances by the year. Moreover, in one colliery the rate per ton or per car may include setting props and doing other dead-work while in another there may be specific rates for different classes of dead work in addition to the rate per car. It, therefore, seems useless to undertake to give rates for tonnage workers.

Reports showing earnings were secured from 216 of the 254 operations in the anthracite region that employed 75 men or over during the year 1921; all the operations in the Lehigh district, 100 out of the 128 in the Wyoming, and 83 out of the 96 in the Schuylkill district. These reports show the name of every employee appearing upon any payroll during the calendar year 1921: the earnings for each one and the number of days on which he started work. The tables which follow classify the men according to the amount of their earnings and show also the average number of the men in each earning group.

Obviously tables made up on this basis do not give the total earnings for the year of many of the employees included. For example, if a man worked ten days in colliery A, six weeks in colliery B, and ten months in colliery C, he would be reported by all three collieries and would appear as three units in the table, but no one of the three reports would represent his total earnings for the year. It would not be practicable to follow each mine worker from colliery to colliery to secure his total annual earnings.

The total number of men reported in the table is of course in excess of the number required to fill the positions, since one individual may be reported from two or more collieries. In the detailed tables published in the appendix the employees in each of the earning groups are shown under the colliery in which they worked, and the collieries are grouped according to the number of days they operated. From these detailed tables a fair idea may be derived of the annual earnings of those who work approximately through the year. From the summary tables it is possible to derive an approximate idea of the possibility of earnings by those employees who work a full year.

One way to avoid some of the difficulties that are inherent in the method that has been adopted would be to report the earnings of only those employees who work throughout the entire year. But this would make an inaccurate showing. A considerable number of employees lose some time during the year through illness, accident, shutdown, bad condition of working places, or other causes beyond their control. Frequently when a contract miner finishes driving his working place it may be some time before he secures another place to work. To give the earnings, therefore, only of those who work for the full year would eliminate all loss of

earnings which were beyond the mine workers' control, would reflect only the cream of the earnings, and would give an exaggerated idea of the earnings of mine workers under the actual conditions of their every day life.

It was deemed preferable, therefore, by the Commission to tabulate all names on the payrolls, since whatever defects there may be in this method are obvious and can be taken into account in studying the tables; and a corrective appears on the face of the tables by the figures showing the average number of starts made by the men in each group. The table on page 49 shows by classified groups the earnings reported for 64,279 names of contract and consideration miners.

As has been stated, this does not represent 64,279 separate miners, since the same man may be included more than once. The very large proportion of men given in the lower wage groups indicates a large amount of "turnover" in the mines, a subject which is considered more fully in a succeeding section of this report. Over 9,000 men are shown as earning under \$100 and as having worked an average of only eight days. This means that many men appeared on the payrolls of different mines and earned less than \$100 in each of these mines. The table also shows that this group made on the average only eight starts in the mines on whose payrolls they appear. Similarly, 4,563 are shown as earning between \$100 and \$200, and as having worked on the average only 26 starts.

The average starts made by all the anthracite mines during the year 1921 was 271 days, some mines having started more than this number of days and some less. The earnings, therefore, in the upper wage classifications where the average number of starts was above 250, may be taken as approximating toward the annual earnings in these groups, and this may be true in the groups immediately below 250. The fact that over 9,000 men appear on the various payrolls as having earned under \$100 in individual mines and as having worked on the average in these mines only eight days, shows that a very large number were going from mine to mine, seeking better opportunities for earning, and through this shifting must have lost no inconsiderable amount of working time.

A comparison of the average starts made by the men in each of the wage groups with the earnings classification gives an approximate idea of the earnings per start made by the different groups shown in the table though the average earnings per start cannot be computed with exactness; one of the significant things disclosed is the increasing

76,016

average wage per start as the earnings groups ascend. In the \$1,500 to \$1,600 group, the average earnings per start approximate \$6.75 and they rise until the average in the \$2,500 to \$2,600 group is around \$9.50; and in the \$3,000 to \$3,100 group it would go above \$11. This steady increase of average earnings per start, with the increasing earnings classes, represent the more skilled miners, or possibly those working in exceptionally favorable places.

The next table gives the earnings of miners' laborers in the same form as the earnings for miners were shown. This table indicates even more strikingly than the one for miners a tremendous shift from one place to another. Over 33,000 miners' laborers are shown as having earned under \$100 in the individual collieries on whose payrolls they appear and as having averaged only seven starts per man. The miner's laborer is the employee of the miner rather than of the company, and the large turnover indicated here shows that the laborers were moving around at an astonishing rate. This condition is more fully reflected in the later section of this report dealing with turnover.

The table given below shows the earnings of outside company men, that is, men paid by the day or the hour, whose place of work is outside the mine and above ground. The first glance at this table shows a marked contrast in steadiness of employment between the outside day men and the inside men. It has been shown in a previous section of this report, dealing with hourly rates, that for similar occupations inside men have slightly higher rates than those outside. The same fact is reflected in this table by the number of outside men who may be considered as working approximately a full year. The earnings of the outside men who may be considered as having worked to the full extent of their opportunity ranges from \$1,100 to \$1,700. Therefore, with the exception of some ten men, all of the groups of these outside day men shown as earning \$1,700 averaged more than 365 days. As in the case of inside men, the

earning of those working over 365 days represent men working more than an eight-hour day, and the earnings, therefore, represent over-time as well as the earnings of a normal day;

TABLE XIV—CLASSIFICATION OF EARNINGS FOR OUTSIDE MEN FOR THE ANTHRACITE INDUSTRY IN 1921.

Labor Turnover and Overtime Employment

Turnover.—A study of turnover in anthracite mines has been made from reports from 127 mines and ten washeries located in the three fields and representing 40 per cent of the total production. By turnover is meant the changes in personnel due to men leaving the employment and others being hired to take their place. The extent of turnover is expressed in a percentage. If there are 100 positions and only 10 changes in personnel during the year the rate of turnover is 10 per cent. If 50 men leave and 50 are hired in their places, the rate of turnover is 50 per cent. If changes go on so rapidly that 125 men are hired to fill the places of men leaving, the rate of turnover is 125 per cent.

The variations in turnover in the 127 operations studied are so wide as to make any average useless. The variations occur not only between the different regions but also between different mines and between different occupations in the same mines. The tables given in the appendix classify the mines by the number of employees, showing on a percentage basis all separations from the payroll that occurred in the year 1921; the number of complete separations, that is employees who did not return during the year; the number who left but were re-employed; the number of new men hired, and the percentage of the normal force that remained at work continuously throughout the year.

Mine workers in their status as employees, are divided into two general classes: (1) Those who are employed directly by the companies, and (2) the laborers who work with the contract miners as their helpers, and are employed and discharged directly by the miner.

This distinction is important in studying figures of turnover, since the management of a colliery has no control over the extent of turnover that may occur among miners' laborers, and there is a tremendous difference between the company employees and the miners' own employees in this respect. In one colliery, with a percentage of turn-

over among company employees of only 39 per cent, which is comparatively low, the turnover of contract miners' laborers was 263 per cent. In another colliery, with a turnover of 68 per cent for all classes of company employees, the turnover rate for contract miners' laborers was 416 per cent.

The wide range in turnover rate both among collieries and among groups of employees is illustrated by figures for the Lehigh region. In the collieries reporting from that region the turnover ranges from 8 per cent to 114 per cent for contract miners; from 11 per cent to 156 per cent for inside day men; from 14 per cent to 52 per cent for outside day men; and from 60 per cent to 416 per cent for contract miners' laborers. Comparing the three regions into which the anthracite fields are divided for all classes of company employees, the turnover ranges in the Lehigh district from 21 per cent to 83 per cent; in the Wyoming region from 8 per cent to 255 per cent, with an even higher percentage at one washery, and in the Schuylkill region from 29 per cent to 194 per cent.

Although in many instances the turnover is above 100 per cent, this of course does not mean that every employee of the colliery left during the year and that there was a consequent change of personnel in every single position. On the contrary, in practically all cases the turnover is limited to a certain percentage of the positions; for example, in a force of 100 employees, 80 of them might remain in their positions without change during the year while the remaining 20 positions might each be filled five different times during the year. This would establish a turnover of 100 per cent, although 80 per cent of the working force was not affected and the plant might be considered as having a more than ordinarily stable force. The tables all indicate the percentage of the total force involved in the turnover by showing in each case the percentage of men who remained at work continuously throughout the year.

In the study of earnings attention is called to the very large number of men who appeared on the payrolls as working less than two weeks. These figures should be taken into account in connection with the study of turnover. In other parts of the report references are made

to the very wide variety of conditions not only between the different mines but in different parts of the same mine and even in different parts of the same vein. Attention also has been drawn to the wide variety from colliery to colliery in the range of rates paid in the different occupations of day men.

When a new contract miner comes to work in a colliery he may find that the better working places are filled. If he is not satisfied with the working place assigned to him, he is likely to quit and go on to another colliery hoping to better himself. He may repeat this attempt over and over, thus becoming a factor in the turnover rate of one colliery after another. In the same way, day men, knowing of better opportunities in another colliery, leave their positions when they hear of a vacancy at a better rate elsewhere. Ordinarily the turnover reflects the demand for labor. When jobs are scarce men do not readily give up a position to seek another, and the turnover at such a time is low. On the other hand, when labor is scarce, when there are more jobs than there are men and when jobs are beckoning from every side, the natural instinct of a man to better his position will reflect itself in an increased turnover.

The output of anthracite coal in the year 1921 was greater than it was in either 1919 or 1920. It was not so large as in 1917 and 1918, but with the exception of these two years it was higher in 1921 than in any year since 1914. It is probable, therefore, that the turnover shown in 1921 may be somewhat above the average. The median turnover point in the three regions—that is the middle percentage for both turnover and stability—is as follows:

	Turnover, per Cent	Stability of Force, per Cent
Lehigh region	55	71
Wyoming region	100	58
Schuylkill region	115	54

These figures mean that in the Lehigh region, for example, the 71 men out of each 100 in the working force remained in the employment of the same company throughout the year, while 29 positions out of each 100 had to be refilled more than once during the year, 55 men being required to fill these 29 positions. In both of the other regions turnover was considerably higher and stability considerably lower.

While the turnover in these collieries seem high, and is high absolutely, it is not so relatively. A study of labor turnover in 157 industrial concerns made by Brissenden and Frankel shows a turnover of approximately 115 per cent for the year 1913-14; for the year 1917-18, under war-time conditions, approximately 180 per cent. A study of eleven firms in Philadelphia for the year 1921 made by the Industrial Department of the Wharton School of the University of Pennsylvania shows a labor turnover ranging from 22 per cent to 183 per cent with the median point at about 66 per cent.

Excessive Hours.—While a general eight-hour day was established by the agreement of 1916, there are still a considerable number of employees working nine or more hours per day. A report covering fifty-five specified occupations was secured to develop the number of employees in these occupations working nine hours or over. The following table gives the returns received from this query. Some companies, but not all, reported occupations in addition to the fifty-five included in the questionnaire, and these have been grouped under miscellaneous. As most of the companies reported on the classes covered in the questionnaire and as reports from a few of the companies show other occupations having a day of nine hours or more, the figures given in this table probably would show less than the total

* Information regarding the length of the basis working day was supplied to the Commission by 148 collieries covering the employees in 54 occupations and their subdivisions. The total number of wage earners reported was 44,003.

(1) Includes all the inside and outside employees not otherwise classified for whom the length of the basic working day was specified.

number of men actually working nine hours or more in the 148 collieries reported.

In the face of the principle of the eight-hour day properly accepted in successive agreements since 1916, there can be no justification for the employment of a considerable number of men on shifts of twelve hours or more.

Hazards.—Although the act establishing this commission does not specifically mention mine accidents among the subjects to be investigated, the Commission cannot refrain from calling attention to the hazards to life and limb in the anthracite-mining industry and to the need for reviving and intensifying interest in safety precautions. Notwithstanding the striking absence of great disasters, such as occur in bituminous coal mines from dust explosions, the daily toll of the lives of miners and miners' helpers from falls of coal and slate and from gas and powder explosions in the working places carries the aggregate of fatalities to a higher rate than prevails among bituminous miners in the same state in which the anthracite mines are located. The thick pitching seams of many of the anthracite mines make for special dangers from falls and from accumulations of explosive gas. Generally, on account of the harder nature of the coal, more explosives are used. Accidents in haulageways and on the surface follow in importance those caused by falls and explosives. After 1916, when workmen's compensation insurance became effective in Pennsylvania, there was some decrease in underground fatalities.

There is no positive evidence that the anthracite miners suffer from special occupational disease. In other words, if accidents can be reduced the average anthracite miner would apparently have a normal expectation of life.

Firebosses and section foremen hold the key to the company side of underground safety; but the active participation of miners in any safety-first campaign is essential. The education and training of miner and mine official in the prevention of hazards have a moral as well as a practical value. A safety committee in every colliery, composed of officials and miners, would be helpful. A pooling of experience and ideas among the different mines of each company and among the companies operating in a district under similar conditions would be desirable. The lesson in prevention which every injury or death might teach if the industry were organized to profit by them should not have to be taught repeatedly by further preventable injuries and deaths.

Safer conditions will not come in a day, as the result of any startling innovations, but rather through long-continued effort on the part of miners' organizations, safety committees, night schools, mining institutes, company officials' meetings, state and federal agencies, all working together and aided by a strong moral support from miners and operators alike. Safety should be a common meeting ground of operators and miners working to a common end through training, education and habitual exchange of ideas and practices.

At the same time the importance of legislative protection and reasonable and well-administered compensation for injuries cannot be overlooked. It is greatly to the credit of the miners' organizations in the anthracite field that they originated and secured in 1869 the passage of the first act in the United States for the state inspection of mines. In the past twelve years the state anthracite law has had little or no revision, efforts in this direction having been defeated by lack of agreement between operators and miners. During this time electricity has been extensively introduced into mining and has brought its new hazards. The anthracite law still has no electrical code in contrast with the bituminous law, which has an elaborate electrical section.

Under the accident compensation law of Pennsylvania practically all of the larger mining companies elect to carry their own risks. The state insurance fund and the commercial insurance companies in which the smaller mine companies are insured maintain a compensation rating and inspection bureau. The insurance rate for a particular mine is based on the degree of adherence to safety standards by the mine in question and on its actual accident experience. This creates an economic motive for safety. Unless this motive and an ordinary decent respect for human life gradually become more effective in making the mines safe for miners there will inevitably arise the question as to whether more drastic legislative interference may not be necessary even if this would mean less coal mined per man and at a higher cost.

The Commission will submit as an annex a brief special report on safety in anthracite mining.

Living Conditions.—Whether the earnings and working conditions are such as to enable the anthracite mine workers and their families to maintain a decent and satisfactory—what is frequently called an American—standard of living is one of the questions on which the Commission has sought information both by personal visits of members in the region and by painstaking investigation of field agents.

The anthracite miners are not, like some of the bituminous miners, a segregated population. They do not live in isolated communities cut off by mountains or by distance from easy communication with others. They are an integral part of the Commonwealth of Pennsylvania, sharing the benefits of the school system, churches, courts of justice, street railways, highroads and other public and voluntary local insti-

tutions. At the same time they constitute so large a part of the population of the five counties, and the mines, directly or indirectly, furnish the means of livelihood to so large a proportion of the residents, that it is fair to speak with qualifications of Scranton, Pittston, Wilkes-Barre, Hazleton, Shamokin, Shenandoah, and Pottsville, as well as the smaller towns and villages, as predominantly anthracite communities.

Their churches, charities, lodges, schools, roads, home life and leisure-time activities are all greatly influenced by the dominating occupations of the men. The great culm piles, the towering breakers sometimes, where modern wet processes of preparation have not been introduced, with black dust rising from them like smoke, the discolored streams carrying black silt, and the broken surface of roads, building lots and fields from subsidence and caving, obvious as all these are to the casual traveller, are, to the trained observer, not more evident than are the effects of the anthracite industry as a whole on the family and community life of the mine workers.

The miner himself works often far underground, exposed constantly to various kinds of physical danger, under conditions not permitting the factory kind of close supervision. He is likely to be controlled in an exceptional degree by local traditions, practices and prejudices, justly proud of his skill and jealous of his rights. He is familiar with rough and ready methods of settling personal differences; and because of diverse national and racial origins he suffers from factional and partisan divisions, which are no doubt less in evidence now than formerly, but are still a disturbing factor both in industrial and in social relations.

The miner's work is severe while it lasts and it influences the character of the recreation and amusements which he seeks when he is free from it.

The domestic life of the mining population has of course all the lights and shadows of any large number of families. It is no longer a submerged or exploited population, whatever may have been true of the period before 1900, when the series of wage increases described elsewhere in this report began. The earnings of full-time workers set forth in the tables of the appendix certainly permit the essentials of a reasonable standard of living. Those who take full advantage of their opportunities to earn in the various occupations connected with the industry and are not handicapped by serious misfortune need not suffer for shelter, food, clothing or other decencies and comforts of life, even without supplementary earnings of wife or children.

On the other hand, many of the families of the miners' helpers or laborers have a very uncertain and inadequate income. These families, often large, are frequently in economic distress. District nurses and social workers are frequent callers at their homes. The scarcity of labor, which the Commission has elsewhere called the limiting factor at the present time in the production of anthracite is precisely in this class of labor. The connection is obvious between the irregular and low earnings and the supply. The industry and the public are especially interested in this aspect of the wage problem for the reason that miners' helpers are the only ones who can get the experience and training to become qualified and certificated miners, and if their wages and conditions of employment are not such as to recruit the right type of men, the future supply of miners is unfavorably affected at its very source.

Operators and unions have the remedy in their own hands. Some adjustment of wages and of the terms of employment which will bring larger and more assured incomes to these laborers is the first step in increasing their number and efficiency. To increase production is not the only or main reason for this readjustment, but if it has that effect consumers of anthracite will have no reason to complain.

The impression which a fair-minded and sympathetic observer in the anthracite region will gain is of drab and bleak exterior conditions, imposed not by lack of earnings or incomes but by the very character of the industry. The communities are not without electric lights, water supply and sewer systems, or churches, schools, libraries and playgrounds, although a considerable part of the population are less supplied with such facilities of community life than is desirable and less than the prosperity of the industry as a whole would permit, if public spirit and civic responsibility were aroused and directed toward supplying the

deficiencies. Detailed information on these subjects will be found in the appendix on living conditions and cost of living.

Sanitary Conditions.—For 19 sample communities of the 116 in which the anthracite miners live, a comparative rating of sanitary conditions has been secured from the U. S. Public Health Service together with definite suggestions for improvements based upon special studies made at the request of the Commission. The 19 communities selected for this purpose include one of the two larger cities (Wilkes-Barre), 8 small company-owned settlements with an average population of 530, and 10 towns with population ranging from 1,080 to 28,000.

The combined sanitary ratings—based on weighted estimates of water supply, sewerage, sanitary control, activities for the prevention of disease, and environment and habits of the population—range from 80.8 out of a possible 100 points in Wilkes-Barre, down to 21 in a company-owned town of about 500 population. Only six of the 19 have ratings above 60—four with a population of over 7,000 and two small company-owned places of less than 400. In general the larger places show an advantage over the smaller in this matter of sanitation, which does not often receive much consideration from the miner, as well as in the educational, social and economic facilities, of which he is more conscious. The average total rating for the eleven larger places is 58.8; for the eight smaller, 49.7. The average weighted mean, taking into account the factor of population, is 67.9 and 49.2 respectively.

Good water is available in most of the communities, and credit for this is assigned chiefly to the natural advantages of the district and to the fact that water is essential to the operations of the collieries. If it were not for the relatively high ratings which could be given for this point, the general ratings of sanitary status would be even lower than they are. Except in five or six places, the sewerage ratings are low. Even where sanitary sewers are available, the majority of the houses are not connected. Privies of poor construction, rarely cleaned and more rarely inspected, are the rule.

With few exceptions, very little is done to insure purity in the milk supply, to protect foodstuffs from contamination, or to keep down the number of flies. Heaps of manure within a few feet of dwellings; garbage and other refuse awaiting collection for days in open boxes, barrels, or tubs; swarms of flies and clouds of dust; meat, bread, fruit and vegetables exposed for sale not only in unscreened groceries but unprotected on hucksters' wagons in the streets; lack of competent supervision of milk, and prevalence of the "one-cow dairy," are conditions which contribute to the low ratings on these points.

Only four of the 19 communities have full-time health officers, and seven have no semblance of organized public health work. Medical inspection of school children is general and in many places there are nurses attached to the mining companies, the Red Cross, the Metropolitan Life Insurance Co., the State Department of Health, or a local society, but for the most part their efforts are uncorrelated and scattered, and hence less effective than they should be.

These facts should awaken a sense of serious responsibility on the part of public officials and citizens.

The exceptions to the general statements given above, the differences between the individual communities, and much more material of interest and value, will be found in the report of the Public Health Service which is presented as an appendix.

Economic History of the Anthracite Industry

Anthracite a Natural Monopoly.—The basis for the Commission's recommendation that mining and marketing of anthracite shall henceforth be regarded as affected by a public interest rather than left to the unqualified and uncontrolled operation of the laws of supply and demand under free competition is the fact that there is and can be no such free competition because the supply is limited and controlled. The conditions are wholly unlike those under which wheat, for example, is produced.

Four facts stand out. Nature has given to eastern

Pennsylvania a practical monopoly of anthracite, the only other producing region worth noticing being Wales, where a few million tons are mined each year, the greater part of it for export to the Continent. The underground reserves of Pennsylvania anthracite are less than fifteen billion tons, about two-thirds of the original deposits. The coal lands are owned by a small number of corporations, estates and individuals, who seldom offer even small tracts for sale and who enjoy the full unearned increment caused by increasing demand and by differential advantages. Ninety per cent or more

of the unmined coal is controlled by eight coal companies and affiliated corporations. There is a unified control of mine labor, the entire region being for practical purposes 100 per cent organized for collective bargaining. For better or for worse the fact to be faced today is that wages, hours, and working conditions must be satisfactory to the workers.

Under such circumstances some of the operators who want peace at any price in order to continue their profitable operations fail to insist on exacting from the workers that honest day's work which in the long run is as much in the interest of the worker as it obviously is in the interests of the public. Together with the land and labor monopoly there is finally a concentration of coal mining in a small group of large companies.

It is this present control of the supply, an economic combination founded on a community of interest, which has brought the Commission to the conviction that the degree of public regulation which it has recommended in normal times and provision for prompt and effective action in an emergency are essential. A brief summary of historical facts will be useful to an understanding of the present situation.

Early History of Mining.—The eventful history of mining within the small area in which anthracite is produced embraces not much over one hundred years. In the first half of the nineteenth century the new fuel gave impetus to the building of canals and railroads, but later these "anthracite" roads sought and gained control of the coal lands, forming a combination of mining and transportation that has been declared illegal by the courts within the past fifteen years, although investigation of the effect of combination began under a legislative committee appointed just one hundred years ago.

The record of the annual output of the mines and the record of anthracite prices not only reflect the result of this contest for unified control but suggests its incentive. The early history of the industry was one of pioneer enterprise in the face of risks and discouragement, a typical American story of initiative, energy and courage. It is a story of discouraging pioneering and slow development of a market, followed by feverish and ruthless competition of carriers for an increasing traffic, peace in the coal business coming only through pools and agreements expressing community of railroad interests.

A number of competing railroad companies built lines to tap the region, and in the natural desire to obtain traffic, entered the business of mining and bought up what was left of the coal-bearing lands. In their haste to prevent other railroads from entering their territory, certain of these carriers bought recklessly and at what were then high prices, a vast speculative reserve of coal lands, an amount of coal in the ground that they could not hope to transport to market in less than scores, if not hundreds, of years. The industry was overdeveloped much as the bituminous industry is now. Overproduction and slack time were the rule. Prices were low, competition was expensive, and profits were small.

When the Anthracite Coal Strike Commission made its report 20 years ago, the industry was only just recovering from a six-year period of overproduction due to mine inflation, when the mine workers especially had shared in the serious losses in that they could be given employment for only 160 to 175 days in the year. It is significant that the commission attributed the betterment in the conditions in the anthracite industry in 1901 in part to "the gradual concentration of anthracite mining properties in the hands of fewer corporations."

Methods of Control.—In order to stabilize the industry and to escape from the results of excessive competition, the railroads and their subsidiary mining companies resorted to pooling of traffic, limitation of output, and other devices. These devices to limit competition provoked much popular criticism and some of them have since been declared illegal by the Supreme Court of the United States. One of these devices existed fourteen years before it was finally overruled by the courts. It consisted in joint ownership by the several anthracite roads of the Temple Iron Co., upon whose board of directors were represented all the

railroad interests of the region. In 1912 the Supreme Court held that the Temple Iron Co. was a combination in restraint of trade and ordered it dissolved. "It has been," said the Court, "an efficient agency for the collective activities of the defendant carriers for the purpose of restraining competition in the transportation and sale of coal in other states."

Another device was a marketing arrangement, the so-called percentage contracts, under which the railroad companies purchased the full output of the individual operators, paying eventually as much as 65 per cent of the average tidewater price, a percentage somewhat related to the high offers of projected competing lines. Orders under these contracts being apportioned according to colliery capacity, one result of the plan was to stimulate mine development without exerting any competitive influence on the market. This non-competitive marketing, which existed for 20 years, was finally terminated by the Court decree of 1912.

The principal and underlying method of limiting competition was the ownership of coal-mining and coal-selling companies by the railroads. The Hepburn Act, passed by Congress in 1906, largely with the relations of the anthracite carriers and their subsidiary mining companies in mind, prohibited a railroad from entering directly or indirectly into the production and sale of coal in competition with any shipper on its lines. Suits brought by the government in 1908 and later resulted in decisions of the Supreme Court directing the divorce of the coal and the railroad properties of three of the principal anthracite interests.

The degree of combination and its effect in competition as found by the Court in these latest cases is pertinent to the present investigation. Eight producing companies, affiliated to some extent with the railroads, produce 74 per cent of the total output and control 90 per cent of the underground reserve. The remaining 26 per cent of the output is contributed by so-called independent companies, but the largest of these companies retains a community of interest with one of the railroads, and nine others control 13 per cent of the output.

Until the decree of the Supreme Court went into effect the Reading and affiliated company, the Central of New Jersey, produced 20 per cent of the output and controlled more than half of the unmined reserve. Through these affiliations of railroads and mining companies the same financial interest controlled both the production and the transportation of coal, and commonly also its wholesale distribution, either through the selling department of the mining company or through a separately incorporated but financially related selling company.

Recent decrees of the Court have not been in effect long enough to develop whether by them the grievances have been eliminated and the industry brought to a competitive basis. The clause in the Pennsylvania Constitution that prohibits common carriers from mining and manufacturing articles for transportation over their lines, in effect Jan. 1, 1874, and the commodity clause of the Hepburn Act of 1906 did not create new and merely technical legal offenses. The practices which they prohibit are opposed to public interest as soon as common carriers are granted the privileges of eminent domain and exclusive franchise.

The Sherman Anti-Trust act is only the embodiment of recognized principles of common law. It was obvious to the owners of anthracite railroads as to others, long before the Hepburn and Sherman acts were passed or the Pennsylvania Constitution was amended, that a company which operated a railroad and also mined coal on its lines had an advantage over other coal-mining companies that were compelled to use the same railroad and that if the several railroads that enter the coal regions were to combine this advantage would become economically irresistible.

The economic position of the larger companies even since dissolution is stronger than that of the so-called "independents." Many of the mines of the independent companies are operated at high cost. Their average royalty rates are higher than those of the railroad coal companies. They have alleged, and the charge was confirmed by the decision of the Interstate Commerce Commission in 1915, that the companies affiliated with some of the railroads had in effect been subsidized by those roads either through cash advances or through remission of interest charges on loans already made to them.

The independents have been losing ground in the proportion of the total output produced, through absorption by the larger companies and through gradual exhaustion of their lands. In 1895 the independents produced 45 per cent of the tonnage; in 1900, 38 per cent; in 1905, 25 per cent; in 1921, even after dissolution of the Temple Iron Co., 24 per cent, and, indeed, if the Susquehanna Collieries Co. be included with the railroad group, the proportion contributed by the independents in 1921 would be only 19 per cent.

Present Degree of Competition.—The question squarely before the public is, which better serves it in certainty of supply and in quality and price of product, the large or the small anthracite companies?

It remains to be seen what effect the Court dissolutions may have on the price of coal. There is no effective competition between "railroad" companies, even though there is a range of 35c. between the highest and lowest of the circular prices for the same sizes of coal. Changes in circular prices have been upward rather than downward since the Court decisions were made. The abrogation by the Supreme Court of pooling contracts has enabled the individual operators outside the pool to get their share of the business, but only when the market has been dull have these and other independent operators sold at prices near the circular prices.

With coal leaving the different mines at two or more distinct price levels, one dealer in a community may be receiving coal at two or even three dollars a ton less than is paid for coal of the same quality by his competitors. In time of good demand the dealer who gets the lower-cost coal may allow his competitor who gets the high-cost coal to fix the price to the consumer, though often the practice of the dealer

buying low-cost coal of adding the customary margin to his purchase price has been followed. This practice, however, results in widely different prices to different consumers for coal of similar quality, or in the equally vexatious advance in price to the same consumer later in the season if the dealer has to supplement his allotment of "company" coal with some "independent" coal. An extortionate retailer needs only to cite the premium price he has paid for a few carloads of independent coal as a screen behind which no local authority can well go, far less an individual customer.

Realizing this unfortunate effect of high-cost coal in the local market in raising the level of retail prices out of proportion to the relative tonnage of the premium coal received, the Commission is convinced that the public would benefit by increased production by the larger and lower-cost companies, and that if adequate publicity could be given to costs and prices at the mines, to freight rates, and to costs of local distribution, the buyer of household anthracite would thereby gain some measure of protection against the demands of unscrupulous dealers. If there be a monopoly in effect it is not in the sense of pooling cost and profit among the "railroad" companies but in the sense that practically uniform prices have been charged by the "railroad" group. From the consumer's point of view the retailer in his purchase of "company" coal might about as well be dealing with a single corporation charging a single price, since differentials are less than 5 per cent among circular prices of the "railroad" companies.

The present differentials in price made by the several "railroad" companies constitute some recognition of the right of the public to share in the advantage of the low-cost concern, but these differences in mine prices are far from reflecting the actual differences in mine costs. While because of great variation in natural conditions certain large companies have costs even \$2 below the costs of other companies less fortunately situated, yet little of this advantage accrues to the public. Even when the difference in mine price is passed on without change to the consumer, the result is not equitable; for example, only one consumer in six in New England last winter got the lowest-priced coal.

Real benefits have flowed to the public from strongly financed companies, although these benefits were largely offset in earlier years by the illegal practices which the courts condemned. The anthracite mines have conserved the country's coal resources by steadily increasing the percentage of coal in the ground recovered and sent to market; they have economized in the capital employed by a closer adjustment of mine capacity to production and in man power by largely eliminating the cost of idle days for men as well as for plants, resulting in a corresponding improvement in the economic condition of the mine workers.

The development of large and strong companies with centralized control may be a source of danger as well as of benefit. For example, the ability to stabilize prices that was used last winter by the larger companies to benefit the public contains also the inherent possibility of real danger. Ownership by the railroads of mines whose product they transported resulted in conditions fundamentally unsound. Financially weak roads have owned what are believed to be profitable mines, much stronger roads have been burdened with much poorer mines, and dividend-paying roads have been favored with dividend-paying mines, with the net result that the record of this mixture of transportation business with mining business is full of uncertainties as to what have been the real profits and on what investment these profits have been earned. It is a wise national policy that has forced the separation of the two types of business the actual relationship of which should be publicly known, not concealed in a maze of accounts.

Capital Costs.—While labor cost, which has been considered in many aspects in a preceding section of this report, is the outstanding item in the cost of mining anthracite, there are two others which though much smaller in amount also show large increases in the past ten years. The cost of supplies, as would be expected, somewhat more than doubled, being for 12 identical companies 35c. to the ton mined in 1913 and 72c. in 1923. The total of the items grouped under "general expense" has nearly tripled, from 33c. in 1913 to 93c. in the current year.

Three of the items under general expense—royalty, depletion, and depreciation—are directly related to capital, and affect the few thousand men and women who hold investments in coal lands or in stock of the operating companies. These three items, in returns for 1921 from 67 companies showing an average for general expense of 90c., together make up 45c. while state and local taxes amount to about 21c., and compensation insurance 7½c. For depletion the average charge reported was 15.8c. per gross ton; the average for depreciation charge for the same companies was 10.8c. Excluding, however, the two "railroad" companies that carry no depreciation account, the average charge is about 15c. Depletion charges range from 7 to 32c. for the "railroad" companies; from 8 to 50c. for the "independents."

Royalties.—About a third of the output of anthracite is mined under leases in which the operator pays the landowner a royalty. The royalties collected on fresh-mined coal range from as low as 12c. on old flat-rate leases to as high as \$1.50 per ton; on percentage leases and on certain stripping operations the rate is even higher. The royalty rate of the Girard estate leases for 1921 averaged \$1.27 per ton on all coal mined, 2,983,723 tons. As the Girard lands are in the Schuylkill region, where mining costs are relatively high and the percentage of domestic sizes relatively low, they are intrinsically less valuable than the lands in some other parts of the region. The high royalties of the Girard estate therefore suggest the profit that inures to the more fortunate operating companies simply in their capacity as land owners. For where the land is held in fee, the mining companies' costs are lower by the difference between the depletion charge and what they would pay as royalty if they were lessees, and there is the possibility of that much higher margin.

The land-holding companies and estates thus share in the monopoly power possessed by the anthracite operations. To protect the public against abuse of this monopoly power, they should be required to file periodic statements of their costs and profits in relation to investment under the program of publicity elsewhere proposed.

Among the independent operators the great bulk of the output—at least 70 per cent—is produced from leaseholds under royalty. Among the "railroad" companies the great bulk of the output is produced from lands in fee. Royalties are therefore not an important item in the cost of producing "company" coal. They are an important element in the cost of producing "independent" coal.

Before the war, over a year as a whole the prices of the independents were about the same as the circular prices of the "railroad" companies, and royalties had a fairly harmonious relation to circular prices. As prices rose, however, the normal relation of royalty to selling price was distributed. When the royalty was limited to a flat rate, the operator profited greatly by the rising price. When the royalty increased with the rise in price, as in the Girard Trust and certain other leases, the operator often found his costs increasing much faster than his margin and was forced to demand higher prices. The result in too many cases has been a vicious circle in which "premium" prices for coal caused an increase in royalty, which in turn was made the occasion for further demands upon the consumer, the only limit to the process being what the traffic would bear.

Royalties thus became a contributing cause of premium coal, and a charitable institution in Philadelphia became the unwitting beneficiary of the distress of the poor in other cities. Thus, although the royalties collected by the estate of Stephen Girard averaged only 31c. a ton from 1899 to 1913; in 1914, under new 15 year leases beginning that year, they averaged 52c. and in 1921 they had risen to \$1.27. Because of the public nature of the Girard Trust considerable attention has been attracted by these rates, when as a matter of fact they are not the only high royalties in the region. One operator reported to this Commission that in 1921 he paid to another estate an average royalty of \$1.50 a ton.

These royalties received by land owners not actively engaged in mining give some idea of the monopoly value of land underlain by workable beds of anthracite. That value is largest and a large royalty best warranted where physical conditions favor cheap mining, as in some stripping operations, which yield large profits even though a high royalty also is paid. A rate, however, that exacts the same royalty from properties whose direct operating costs, exclusive of royalty, may be higher than even the circular price is inequitable and demands some relief as was granted in 1920 by the Girard estate and at least one other land-owner. In theory the justifiable interest of the land owner should be a share of the net returns, and it is the method of determining royalty as a percentage of gross receipts, and those often at the highest prices, that has led to the recent marked rise in royalty charge.

The "sliding scale royalty" may work a hardship on the operator in that it disregards the fact whether he realizes a profit or not, and it may work injury to the consumer by its influence in still further raising the premium price. One suggestion is that all existing leases with this sliding scale royalty be amended to refer to the circular price instead of to the premium price taken from the distressed consumer. Land owners can well offer this equitable adjustment since the royalty would surely exceed their fondest expectations of ten years ago. The owners of anthracite lands should be as much concerned as others in the industry—operators and mine workers—in setting the house in order to avoid any future demand for drastic regulation for the protection of the consumer.

Ten-Year Record of Margins and Profits in the Anthracite Industry

Margins and Profits.—The Commission has not completed its study of investment and therefore cannot yet state what the profits have been in terms of return on investment. It has completed a study of mine costs and sales realizations which throws some light on profits. Since only the sizes above pea sell at prices generally higher than the average cost of mining and the smallest sizes considerably below that cost, market prices give little clue to margins except as the operator's proportion of large or domestic sizes and small or steam sizes is known. However, the average sales realizations on all sizes have been reported and can be compared with average costs for the same companies over the series of years.

For the 12 companies the average of these sales prices received ranged from \$2.63 in 1913 to \$6.78 in the first quarter of 1923. Distinguishing between the "railroad" companies and the larger independents, the 9 railroad companies received for all sizes an average price 28c. lower than that received by the 3 independents in 1913, and 89c. lower in 1923. Part of the difference is due to the fact that two of the "railroad" companies turn their coal over to affiliated sales organizations at transfer prices considerably below circular.

The margin per ton between cost of production and net sales realization includes all the earnings from the mining of coal available for payments on account of capital, whether paid out in federal taxes, as interest, as dividends, or reserved as surplus. The margin will not show return on investment until the amount of the investment is established, but it will indicate whether over a period of years profits are increasing. This margin is simply what capital, whatever its amount in the business, receives for services rendered in mining the average ton of coal, and thus the margin per ton as capital's wage is fairly comparable in nature with the wages paid per ton to the mine labor.

Measured by this margin per ton the anthracite operators are receiving much larger profits at present than they customarily did before the war. For the year 1913 nine "railroad" coal companies had an average margin of 36c. a ton. In the first quarter of 1923 the same operators received a margin over reported costs of 93c. a ton. But because of differences in accounting methods in respect to depletion and depreciation, these reported costs, although following the Treasury Department's requirements, are not strictly comparable with the costs as determined by the Federal Trade Commission for earlier years. To make them comparable it is necessary to deduct 14c. from the costs as now reported and add 14c. to the margin. This would make the 1923 margin \$1.07 per ton, or three times the pre-war margin. The trend of margins through the period is indicated by the following table:

TABLE XVI—CHANGES IN MARGIN PER TON RECEIVED BY NINE RAILROAD COAL COMPANIES, 1913-1923

Period	Margin Reported By Federal Trade Commission	Margin Over Costs Reported To Coal Commission	Margin Adjusted So As To Be Comparable Throughout Period
1913	\$0.36		\$0.36
1914	.37		.37
1915	.33		.33
1916	.39		.39
1917	.63		.63
1918	.38		.38
1919		\$0.43	.57
1920		.36	.50
1921		.67	.81
1922 1st quarter		.31	.45
1922 2d and 3d quarter		Suspension	Suspension
1922 4th quarter		.91	1.05
1923 1st quarter		.93	1.07

The difference in accounting methods between the cost investigations of the Federal Trade Commission and the costs submitted to the Coal Commission by the operators will be discussed in detail in a special report on costs and profits. The difference in method does not invalidate comparison between costs of several operators when calculated by the same method. To compare costs as ascertained by one method with costs as ascertained by the other, however, requires the adjustment above noted. Thus, the average margin in the four years before the United States entered the

war was 36c. In 1919 the average margin (adjusted) was 57c. In 1920 and 1921 it was 50 and 81c., the variations in these years representing in part movement of steam sizes into storage and out of storage to the market. During the suspension of 1922 the companies lost money heavily, but in the last three months of the year, their margin (adjusted) was \$1.05, or three times the pre-war figure.

Further evidence that the profits of the anthracite companies are increasing is found in the increase of their surplus accounts. There are five "railroad" coal companies engaged exclusively in the mining of coal that have been paying dividends in recent years. The total surplus of these five companies rose from \$7,000,000 in 1911 to \$52,000,000 in 1920. In other words it increased sevenfold in ten years. The following year (1921) it dropped to \$36,000,000, chiefly because of the payment out of surplus during 1920 and 1921 of very large dividends by four of the five companies. This statement does not include the Philadelphia & Reading Coal & Iron Co., which showed an increase in surplus account, but paid no dividends, and practically no interest on advances previously made to it by the Reading holding company. Neither does the statement include the Scranton Coal Co., which pays no dividends. The increasing surpluses of two other "railroad" companies are omitted because they report transportation income as well as coal income.

These figures of increasing surplus do not of themselves show what the profits have been; all that they show is that compared with pre-war conditions present profits show a large increase.

The net income accounts of the anthracite companies also show an increase. In 1913, the combined net income of eight railroad coal companies that produce 57 per cent of the output was \$13,600,000. This statement includes the net earnings from the coal departments of two companies engaged both in mining and transportation but excludes their earnings from transportation. In 1920 the net income of the same companies had risen to \$33,000,000. In 1921 it was \$27,000,000, or twice as great as in 1913. The production of the eight companies during this period showed practically no increase.

Until the total earnings can be compared with the total investment, the public should withhold judgment as to the profits received by the anthracite industry. It may be that judged by this standard, the margin obtained before the war was too small. If, on the other hand, the pre-war margin was adequate, the present margin may be unduly large, unless in the meantime there has been a marked increase in the investment. The task has proved so involved and far-reaching that the findings of the Commission on the subject of the profits of anthracite companies are reserved for a later report.

The work in hand involves examining the books of operating companies and their related sales agencies. From the reports of the Commission's examiners so far obtained it is not possible to generalize as to the average rate of profit on the aggregate investment in the anthracite industry. The Commission finds that some of the lower-cost companies have been extremely profitable and have paid very large dividends even though their sales prices have been relatively low. It has found other companies with higher costs whose rates of return have been small and which have paid small dividends or no dividends at all, but until the study of investment is completed, the evidence of dividend payments must be accepted as an indication rather than explicit proof of profits. In a number of important companies the outstanding capital stock represents but a small portion of the book value of the property.

Whether the peculiar corporate organization of the anthracite industry has been helpful or harmful to the public turns in the last analysis on whether its profits have been reasonable. The fact of an economic concert amounting to combination is established beyond reasonable doubt. Its capacity for public service is demonstrated. The point upon which the public demands explanation is whether or not it has used its monopoly power to extort exorbitant profits from the consumer.

Compulsory Rendering of Cost, Price and Profit Reports Recommended

Publicity of Accounts.—Regardless of the final verdict as to reasonableness of profits the Commission is convinced that publicity of costs, prices and profits must be provided to protect the interest of the public. At present the current reports published by the Federal Government deal only with statistics of labor, production and stocks of coal, and even these are returned voluntarily and there is no power to go behind the figures submitted. Most of the companies file these voluntary reports promptly and cheerfully, but certain ones do not.

During the crisis of 1922-23 the reports on coal storage issued by the Federal Fuel Distributor did not contain the all-important information on stocks of anthracite held by the producers because the Hudson Coal Co. was unwilling to furnish its share of the information. The Commission, therefore, recommends legislation providing for regular accounting reports to be rendered by all companies whose product moves in interstate commerce, and further recommends that the agency to which the reports are rendered shall have the power to prescribe the form of accounts. The opportunities for inflating figures of costs are so numerous and the questions as to how investment shall be reckoned are so unsettled that without such continuous publicity the Commission fears that the concentrated control of the anthracite industry may take indefensible profits.

It is found for example, that two of the largest companies carry no depreciation account, but charge certain outlays for replacement direct to operating costs. Without the most minute checking of each item it is impossible under this arrangement to be sure that items properly chargeable to capital account have not been included in current costs. The field accountants of this Commission report that some of the companies in earlier years charged off against current operations the entire costs of new plants, equipment and development work, which good accounting practice would recognize as legitimate capital charges. This subject will be discussed in detail in the Commission's final report since it concerns also the bituminous industry.

Measure of Investment.—The Commission has found itself confronted with conflicting claims as to the basis upon which the rate of income should be reckoned. One claim is that the market value is the proper measure of the investment. In the anthracite industry, however, the market value depends upon profits and prices of anthracite for the last 25 years, and has been influenced more or less by the operations of what the Supreme Court of the United States has declared to be a combination in restraint of trade and in violation of the commodities clause of the Hepburn Act.

Another claim is that income should be reckoned upon original cost. Another that the investment should be reckoned in accordance with the rules prescribed by the Treasury Department in the income tax returns. Still another suggestion has been that the rate of income should be reckoned upon the cost of reproduction. There is no such thing as reproducing an exhausted coal mine.

The Commission deems itself justified in finding as a fact that the mining, transportation in interstate commerce, and sale of anthracite coal impresses that commodity with a public use. It is not strictly analogous to but bears some resemblance, therefore, to the problem of valuing a public utility for the purposes of regulating rates. It will not be found that the courts have laid down a single formula for ascertaining values. Each case seems to rest upon its own merits. They have considered original cost, stock and bond issues, and cost of reproduction and have been governed in their decision sometimes by one element and sometimes by another.

Cost of reproduction might well be reported as a fact with reference to the plants and equipment, for that would give a fairly definite figure, but as the greater part of the investments claimed by the anthracite companies is in coal-bearing lands, reproduction of course cannot apply to these lands,

because the lands cannot be reproduced. Present market value may not afford a satisfactory basis of valuation because there are no lands of like character anywhere else, because they are not in the market for sale save as they may in rare instances from one operating company to another, and because such sales as do take place are of course at prices which reflect current profits.

As the Commission is not called upon to judicially determine the valuation of these plants and these lands, nor to state how a public official, state or federal, shall value the same for taxation or other purposes, it does not deem it prudent to lay down a rule for making such valuations. There will of necessity enter different elements in fixing the values of each company should the courts be entrusted with the discharge of this duty. If the rule shall be adopted in these valuations analogous to that of public utilities then of necessity the Court will consider its original cost or investment as part of the evidence in the case although not necessarily conclusive as the value thereof.

As furnishing the necessary facts for the making of this valuation the Commission will set forth in its report on the investment and profits for the use of the Congress and the public all the information on these subjects which it has been able to obtain, whether relating to original cost or investment, outside capital from time to time put into the business, earnings that have not been drawn out but left invested, as well as dividends paid, additions made to book value by reason of revaluation, whether based on actual appraisals or otherwise, statements of investment made for taxation purposes, and current market value.

The valuation of coal lands is not like the valuation of farm lands, where the value is determined by the free play of competitive force as millions of owners buy and sell, rent and mortgage. The anthracite industry is not governed by the free play of economic force. The crowding of the resources into an area of less than 500 square miles, concentration of that resource in the hands of a few large corporations that own 90 per cent of the reserves, the elimination of competition in price between them, the recurrence of shortage and consequent high price that may arise at any moment through the exercise by the trade union of its monopoly control over labor at the mines requires some measure of protection for the consuming public in the just and equitable valuation of these properties. The profits of the anthracite companies will look large or small according to the value that is ultimately determined to be fair for the coal-bearing lands.

Deficiency of Production.—A concise statement of the record of anthracite production is that for twenty years before 1913 production has followed closely the increase in population and since then it has not kept pace with the population either in the nation or in the States which rely upon anthracite as household fuel. From 1913 to 1922 the total production of anthracite remained practically constant except for the extremes of the record year of 1917, when it rose to 99,611,811 net tons, and the suspension year 1922, when it fell to 54,683,022 tons, while the population is estimated to have increased in the same period about 15 per cent. This steadiness of output is in marked contrast with the extreme fluctuations in the bituminous industry, which in a large way reflect nationwide business conditions; and the recent lag in increase of production as compared with population is equally in contrast with the rapid increase in bituminous production, which follows the growth of industry rather than that of population.

The inference should not be drawn, however, that there has been no large increase in output of anthracite. An interesting comparison can be made with the conditions 20 years ago. The Roosevelt Commission assumed that anthracite production would reach its maximum limit at 60 to 75 million long or gross tons, whereas the actual output in 1917 and the six months of 1923 indicate that whatever may be the potential market capacity, the present mine and washery capacity is at least 90 million gross tons a year. More significant is the progress made in 20 years in lessening the wide gap between mine capacity and actual output; with approximately the same number of mine workers, the production was 50 per cent greater in 1920 than in 1900. To

that extent the anthracite industry was once overdeveloped and overmanned much as is now the bituminous industry.

In the past two decades the geographic changes in the distribution of anthracite have been slight. The natural market for this superior household coal is in the nearby regions of longer and more severe winters, and the Northern States, with Canada, have increased their quota at the expense of the Southern and Western States. In the present distribution of the sizes suitable for household use 74 per cent goes to the states between Maine and the District of Columbia, and of these states only Maryland and Pennsylvania are coal producers. An additional 7 per cent goes to central Canada. Pennsylvania herself consumes only about the same quantity of domestic sizes as New England and less than half as much as is shipped to her nearest neighbors, New Jersey and New York. These facts illustrate interstate dependence.

A study of the present distribution of domestic anthracite

The Problem of an Insufficient Supply of Anthracite

Causes of Shortage.—Insufficiency of the available supply of anthracite is the acute problem of the moment and the serious problem of the future.

The failure of the anthracite industry to furnish an abundant supply of the domestic sizes is generally not due to a lack of transportation facilities, as in the soft coal industry. Among the anthracite operators complaint of car shortage is rare. The failure to visualize the magnitude of the traffic involved in taking the daily output of anthracite to market leads to misapprehension.

Travelers in the vicinity of the anthracite mines notice loaded coal cars on the sidings and infer that coal is being held back from market with a sinister purpose. The fact is that for several months past, from 6,000 to 7,000 cars have been loaded each working day at the anthracite breakers, so that 45 to 50 miles of cars start on their journeys each day. In the course of making up trains and despatching them, standing cars as well as moving cars must naturally be seen. In its recent decision on the distribution of coal cars the Interstate Commerce Commission specifically mentions the absence of any reason for continuing the investigation of carriers serving solely anthracite mines. Such community of interest as may exist between the mining of anthracite and its transportation has the beneficial effect of co-ordinating car supply and colliery output.

With one exception, the periods of shortage in the supply of anthracite have been associated with suspensions or strikes at the mines. The one exception was the period from the fall of 1916 to the spring of 1918, when increased demand resulting from the war, coinciding with a shortage in the supply of bituminous coal, made an unprecedented demand upon the anthracite industry. To that increased demand operators and mine workers responded to the best of their ability, and the difficulties experienced by consumers during that period must be laid to the strain of the war, to an exceptional severity of weather and, so far as Western communities were concerned, to the necessary restrictions of the Fuel Administration on westward transportation, rather than to any deficiencies in the anthracite industry itself. Though the number of mine workers was materially decreased, their response to the special demand established 1917 as the record year in anthracite production. Undoubtedly, the increase in output carried with it some decrease in quality.

The other periods of shortage have been directly connected with suspension of production at the mines. The country has not forgotten the effects of the great strike

has brought to light no evidence that economic combination takes the form of concerted partition of territory, either among the larger companies or between the "railroad" and the "independent" companies. A few localities are served by a single company simply by reason of the logical relation of railroad routes. Most of the time beginning with 1917 the increasing demand and stationary supply have made the dealers compete for shipments often regardless of prices. Competition by the operators for territory without, even then, any competition among "railroad" companies in price has largely given place to an allotment system under which it is recognized that the first obligation of a mining company is to its former customers, a principle first proposed and made mandatory by the Federal Fuel Administration in 1918 and again enforced in the past winter by the Committee on National Distribution. Should any surplus supply of anthracite seek a market, the former active competition in salesmanship and advertising might be resumed.

in the summer of 1902 upon the supply during the following winter. A shorter suspension at the expiration of the wage agreement in 1912 also was reflected in more or less distressing scarcity of household fuel in the following winter. In that year the mines were idle for 40 days and in the following winter, although this may not be generally remembered, high prices led to a federal investigation.

To produce the increased quantity demanded, without any corresponding increase in the capacity of the mines and even with an actual decrease, involved working the mines more and more steadily. A 20-day "vacation" in which three-fifths of the men in the anthracite region were idle in September, 1920, in protest at the award of the Anthracite Coal Commission, led to a distinct flurry in the market in the next winter, with local complaints of scarcity of coal, unreasonable prices and inferior quality.

Experience of 1922.—From the effects of the long suspension in 1922 we have not even yet recovered. For more than five months in that year not a wheel turned in the anthracite region. The suspension of mining reduced production for the year 40 per cent below the normal output. A 60-per cent supply had to serve. To protect the public from extortion and inequitable distribution of this partial supply the coal operators promptly joined public officials in making the best possible allotment. The close-knit organization of the anthracite industry made possible an effective control of distribution.

All but one of the larger companies, the Hudson Coal Co., pooled information regarding the distribution of their product in previous years, and after mining was resumed it was possible to keep an accurate check on the weekly distribution of 85 per cent of the available coal. A system of allotments was established by which each community received during the winter of 1922-23 a proportion based upon its purchases in previous years. This would have been impossible in the competitive bituminous-coal industry, which possesses neither the records, the machinery nor the discipline necessary for such an undertaking.

The control of prices at the mine in the winter of 1922-23 was almost as successful as control of distribution, although the acts of a small minority of operators and jobbers and dealers largely prevented the consumers from receiving the full benefit of this control. Realizing the hardships that a runaway market would inflict upon those least able to pay high prices, the Pennsylvania Fuel Commission, with the co-operation of all but a few operators, mostly irresponsible persons attracted to the business by the existing shortage, fixed a scale of "fair prices."

According to the Pennsylvania Fuel Commission the coal mined by the "railroad companies" and certain independents, over 77 per cent of the total, was sold at \$8.50 or less, these circular prices being adhered to at this time of acute shortage just as in a time of abundance. Unquestion-

ably these large producers might have obtained from the retailers of anthracite during the past winter much higher prices. *This Commission desires to pay public tribute to the restraint and good judgment displayed by the responsible shippers of anthracite during that trying period.* In a less centralized industry prices could have been held down only by arbitrary government action such as was authorized during the war by the Lever Law.

The amount of anthracite now being mined, shipped and distributed equals that of the war period. The total production in the first half of 1923—over 50 million short tons—equals the maximum recorded for a half year.

The strength of the market at the present time is good evidence not only of the apprehensions of buyers, which may be allayed by the renewal of the agreement between operators and miners, but also of the popular belief among one-third of the American people that "coal" means "anthracite," and that they must look to the anthracite mines of eastern Pennsylvania for their fuel. It is this ingrained preference for the clean and smokeless and slow-burning coal that enables at the present moment the smallest and weakest independent producers to obtain a price \$2 or \$3 above that at which two of the largest and strongest companies sell equally good if not better coal. Of course, these companies cannot immediately take on new customers.

The same preference for anything bearing the name "anthracite" permitted the sale of scattered carloads of "fireproof" coal at "bootleg" prices, while 77 per cent of the available supply was furnished by the "railroad" companies to their customers at little if any increase over former prices. These companies, however, did not in 1923 make the customary summer discounts. The excess of demand over supply has become the rule in recent years, and in the face of this excess of demand there plainly has been no definite economic relation between "company" prices and "independent" prices. In earlier years, after the termination of the pooling contracts, the price of independent coal fluctuated with the law of supply and demand, these smaller operators reaping an occasional rich harvest in time of panic or shortage, maintaining prices above the level of the "circular prices" in times of active demand, and cutting below that level and even at times selling coal at a loss when the demand was sluggish.

Need of Greater Capacity.—The usual undersupply of anthracite and the frequently recurring extreme shortages together make unnecessary any overt act to control the market; even with a potential monopoly of production it is not necessary that there should be a combination in restraint of trade in the legal sense to explain present price levels. If there is any well-founded suggestion of concerted action it is shown in the small range in circular prices, the extremes in prices of company coal of domestic sizes being only 35c. although all this coal could be sold at the higher circular price and probably much nearer the price level of the independent coal. Doubtless both business sense and regard for public opinion have led these strong companies to acquiesce in the noticeable differential between their own prices and the higher prices of the independents.

Only 6 per cent of the coal left the mines during the past winter, according to the Pennsylvania Fuel Commission, at prices of \$10 to \$12, as against 77 per cent at the circular prices of \$8.00 to \$8.50. The influence of this relatively small tonnage of extremely high-priced coal on retail prices, together with that of an insignificant quantity of coal of poor quality put on the market at even higher prices by irresponsible operators in defiance of the State Commission was, however, all out of proportion to its amount.

The conservative policy of the larger operators in stabilizing the market is based no doubt on sad experiences of the past, when unrestricted production caused disaster from which everyone connected with the industry suffered. This policy may be carried too far. If production is kept under demand, as it has been over many years, any temporary disturbance will of course give opportunity for swollen profits. Full credit should be given to operators, jobbers and retailers who for any reason do not take advantage of this chance to profiteer. The "companies" and some of the independents as well as many retailers and wholesalers deserve this credit. This does not, however, absolve the anthracite operators from responsibility for creating the permanent conditions which in a crisis make such profiteering possible; and even in a crisis the wholesalers and retailers cannot justify a sweeping advance in prices by any evidence which the Commission has obtained as to what they actually paid for premium coal and the amount of it which they actually bought.

It is very desirable to prevent the panicky market which results from the stoppage of production; but it is also desirable that the normal demand for anthracite shall be met and that this shall be done at a lower price level if

by any reasonable reduction of royalties, operating costs, freight rates or profits this is possible. The coal companies should not be allowed to hold large reserves indefinitely, instead of developing them. Such a policy would make the coal last longer, and this is sometimes defended as conservation. But a sound conservation policy does not require the present generation to pay extravagant prices or resort to inferior substitutes for the sake of a doubtful benefit to posterity. Genuine conservation will prevent waste and encourage the mining of even high-cost thin seams when the coal would otherwise be lost altogether, but will not countenance the holding reserves undeveloped for the purpose of stabilizing prices at a high level or insuring future tonnage to particular railroads.

Whether to increase the capacity of the anthracite mines or to make better use of present equipment is an economic as well as an engineering problem. It is estimated there remains a little less than fifteen billion tons in these Pennsylvania fields. The capacity to mine the anthracite is dependent on underground development, and the equipment of mines and breakers, and the available labor supply. Of these two factors the lack of labor is the more serious in that without an adequate labor supply mine-development can not be expanded. The number of employees in the production of anthracite reached its maximum of nearly 180,000 in 1914, but in the two years of maximum output, 1917 and 1918, the labor supply was near its minimum, only 154,174 and 147,121 respectively.

The explanation of this apparent anomaly lies in the exceptionally large number of days worked in those two years—285 days in 1917 and 293 days in 1918—and in the notable increase of efficiency of the miners in the war period. At the present time the rate of production of anthracite is fully that of the record year 1917, and again this high rate of approximately one hundred million net tons a year is maintained by the steadier operation of the mines and the more regular attendance of the mine workers rather than by any increase in mine development or labor supply.

Capacity is measured by the quantity of coal that would be produced if the mine were worked full time at the actual daily rate for the particular year. The conclusions of the engineering staff point to a decline in colliery capacity during the past ten or twelve years. Nor, with one exception, is there now in progress any new mine development of consequence to offset the normal reduction in capacity by wearing out of plant or mining out of reserves. The observations of the engineers, however, are in line with the labor studies to the effect that the present deficit in labor is a shortage of miners' laborers rather than of miners themselves, so that at present the limitation of capacity can not be charged to the Pennsylvania requirement of certification of miners.

More unskilled miners as well as laborers will, however, be needed to maintain production, to say nothing of increasing it, for there are factors at work tending to lower the production per man. There was an apparent increase thirty years or so ago, due to the increasing use of small sizes which before had gone to the waste pile. Whereas the output per man per day in the bituminous industry is increasing steadily, in the anthracite industry it is less to-day than it was twenty years ago. For the past ten years the daily production of fresh-mined coal per man employed underground has been practically stationary.

Chief among the factors tending to decrease the production per man is the constant decrease in thickness of beds worked and to the increase in depths of working, both items making for increased mining costs. Nor is the outlook encouraging when it is realized that the Northern field, in which the mines yield 70 per cent of domestic sizes, is being exhausted much more rapidly than the Southern field, where the mines yield only 53 per cent of domestic sizes. At the present time the average mineworker in the Northern field produces nearly 30 per cent more domestic coal than the mine worker in the Southern field. Yet it is from this Southern field with its greatest reserves that the future supply of domestic anthracite must come in increasing degree.

It is impracticable to attempt any quantitative statement

of the extent to which loss in labor efficiency has tended to reduce productivity. That there is some tendency to limit each man in the amount of coal to be mined and loaded in accordance with local feeling and tradition is not seriously denied. The introduction of labor-saving or product-increasing machinery although not opposed by the miner in principle gives occasion for vexatious and expensive delays in discussion over the conditions under which it is to be used, the rates of pay, the number of men on a machine, etc.

It would be to the interest of the industry as a whole as well as to the public interest if the miners' organization should become an active and aggressive instrument of greater efficiency in mining, co-operating heartily with the management in every effort to reduce mining costs by preventing waste, abandoning obsolete practices, diminishing labor turnover and in all other ways helping to establish good production standards.

Improved mining methods and mine machinery have of course slowed down the decrease in productivity, but even then the rate per man per day was only 2.09 tons in 1921 as contrasted with 2.50 tons in 1899. Better engineering should help to compensate the natural factors making for decreased output and thus give the consumer the anthracite he needs.

The engineering study of the breakers, where the mined coal is prepared for market, indicates a reserve daily capacity one third in excess of actual production in 1920. Indeed, this unused capacity is estimated as sufficient to handle the output of some 43,000 more men than were employed in 1921 and 13,000 more than the highest number ever employed. This unused breaker capacity might add something like

20,000,000 tons a year to even the present high rate of output, adding nearly 12,000,000 tons of domestic sizes.

The high-cost mines as a rule are more expensive in manpower and yield the lowest return in coal for a day's work, with the result that high prices which keep these mines running also tend to decrease the average productivity of mine labor. With these relatively high-cost and inefficient mines in operation the only practical method of increasing the supply of domestic anthracite is to recruit the labor supply of the lower-cost mines to full breaker capacity.

When the working capacity of present mine and breaker development has been reached, the question of double-shift operation should be considered as well as the opening of new mines or the building of new breakers. It is economy to make this more continuous use of the equipment which represents so large a part of the necessary investment in the anthracite industry. The difficulties in the way of establishing a new practice in this respect are recognized but they are not insurmountable.

The Commission concludes that at present the supply of unskilled laborers is the immediate limiting factor in anthracite production. This has been the condition since 1916. It may not be described, however, as a physical limitation over which the operators have no control. Other industries employing similar labor have increased the working forces during this period, notably the bituminous mining industry, to an excessive degree. It therefore appears that earnings and conditions of labor offered by the anthracite industry viewed in the aggregate have not attracted labor in the same degree as have the wages and conditions offered by other industries.

Better Combustion Practice and Use of Substitutes the Consumer's Responsibility

Improved Practices.—Better utilization of the anthracite that is mined is a problem in national economy in the solution of which anthracite consumer and anthracite operator must join. In terms of total annual output the supply is stationary; in tons per capita it is declining.

Improved practices in the use of anthracite as well as in its preparation that promise some relief relate to the sizing of anthracite and the disposition of the smaller sizes, better inspection of the coal as it leaves the breakers, use of substitutes and better fuel economy in household heating.

Simplified practice in sizing of anthracite is needed. Coal is now commonly sold in four domestic sizes—egg, stove, chestnut and pea—and three steam sizes—buckwheat, rice and barley. To prepare these seven sizes and keep them separate in their journey from mine to destination adds to the cost. It adds to the cost of preparation and it decreases in proportion the domestic sizes through breakage in repeated crushing of the lumps. It adds to the cost of switching and handling at railroad terminals and tide-water piers. It adds to the cost of the retailer, who must store and truck the several sizes separately.

Reducing the standard sizes from seven to four, as proposed from time to time and as already practised in part by one of the large producers, would reduce costs and increase the amount of domestic coal available. It would facilitate wider use of small sizes for heating.

The Commission therefore urges that the question of simplified sizing be considered at once by a joint conference of producers, railroads, retailers and chairmen of state and municipal fuel committees, and that the Bureau of Mines be consulted in determining the sizes to be produced and in reporting on the relative heating values of the present and proposed sizes. The simplification is recommended in the interest of the public.

To dispose of the steam sizes is perhaps the chief problem of the anthracite operator. It is also a matter of vital concern to the householder, for the present loss on the scale of the steam sizes has to be charged against the price of the domestic sizes. As the mines become deeper and as the center of production moves toward the pitching measures of the Southern field, the percentage of steam sizes is expected to increase.

Hope for wider demand for these small sizes, that will absorb the increasing output, is found in the trend of combustion engineering. The engineers of the Commission ex-

pect improvements in the manufacture of briquets and in burning powdered anthracite for power generation. If the superpower plan, outlined by the Geological Survey, is carried out, large central stations will be built near the anthracite region and will absorb millions of tons of the fine sizes. The problem calls for educational salesmanship on the part of the anthracite operators and receptive co-operation on the part of the consumer.

Complaints of poor quality of coal are a common feature on the recurring shortages of anthracite. The complaint is not confined to isolated carloads of "fireproof" coal shipped by "snowbird" operators. There is a widespread feeling that quality deteriorates during periods of scarcity and that much dirt, slate and bone is passed on to the consumer. It is this feeling that has inspired bills providing for government inspection introduced both in Congress and in the legislatures of several States.

It is not possible to ascertain what per cent of coal shipped during the crisis of 1922-23 carried an unreasonable amount of ash. It is known that many of the responsible shippers have not relaxed their standards of preparation. Those shippers have every reason to join with the public in support of some plan to protect the good name of their industry by guaranteeing the quality of the product.

The Commission therefore suggests to the anthracite producers that they join in an intercompany inspection service, which shall be empowered to prescribe standards, inspect and sample shipments, reject inferior coal and certify—if not guarantee—the quality of coal passed. Membership in the inspection service should be optional, but few producers could afford to stay aloof from such an association, when once established.

To this plan the objections commonly raised to grading do not apply. The sizes of anthracite are already largely standardized and the number of grades is small compared with bituminous coal. It is not proposed to abolish trade names which represent an investment in good will, but merely to certify that the coal in question reaches a minimum standard of quality.

As a pledge of good faith to the public the Commission suggests that the operators invite the U. S. Bureau of Mines to participate in the proposed inspection service both by technical advice in laying down standards of preparation and by detail of a fuel engineer to observe and check the work of inspection and grading.

Co-operative inspection is preferable to compulsory government inspection because it can be inaugurated at small expense by consolidating the inspection forces already maintained by many of the companies and because it is in line with the idea that the responsibility for management should be thrown back upon the industry itself. If, however, this proposal is not accepted by the anthracite trade or should it not in practice effect the desired purpose, the Commission recommends that a federal law should be enacted for permissive grading and inspection.

To eke out the inadequate production of anthracite each year the waning supply must be supplemented by increased use of other fuel. In the anthracite-consuming territory proper, convenient substitutes are not generally carried by the retail trade. The nearest bituminous mines are a hundred miles farther away and therefore pay higher freight charges. Very few mines in the bituminous districts adjacent prepare their coal in the sizes convenient for household use. So ingrained is the habit of using anthracite that there is little effective competition with other fuels. They have not displaced anthracite; they have supplemented it. Competitive relations have tended to advance the price of substitutes quite as much as to depress the price of anthracite.

The most promising supplementary fuels are small sizes of anthracite, used either in specially designed furnaces or in present furnaces either in the form of briquets or mixed with the larger sizes; carefully prepared bituminous coal of the kind commonly sold in the West and South; coke specially prepared for domestic use either in byproduct ovens or by some process of low-temperature carbonization. Manufactured gas or fuel oil may appeal to some householders, but the prospect for producing either of them at prices that will be attractive is not reassuring. House heating by electricity is not within the realm of practical affairs, as is quite evident if the thermal efficiency of good house furnaces is compared with that of the generating station. It would take five times as much coal at the station to generate the current required as to generate the heat at home. Whatever may be possible in the Far West, where there is surplus water power, the conditions in the anthracite-burning region are such that the current from any hydro-electric plant would cost perhaps three times as much as the coal used in the house furnace.

The engineers of the commission are convinced that with suffi-

ciently active demand the manufacture of briquets and of coke can be so improved as to yield increasingly large amounts of supplementary fuel. The problem is one of salesmanship, public education and intelligent choice by the consumer.

A responsibility for extension education in fuel economy rests upon our research organizations and universities. They have devoted much attention to combustion economy in the operation of power plants. It is now in order to turn attention to economy in household heating. The chief need is to make available to the home owner the simple facts about what to burn and how to burn it. Responsibility also rests upon the retail coal dealer to spread the knowledge and use of supplementary fuels. The commission commends to retail coal associations the subject of showing people how to cut fuel bills. This is salesmanship of a high order and will return a dividend in increased business and in a larger measure of public confidence not always now accorded to the retailer. State and local fuel committees and local chambers of commerce may play an important rôle in extending the use of supplementary fuels and in furnishing practical advice to any householder who is considering a substitute.

The chief responsibility, however, rests upon the householder himself. The inertia of habit has played into the hands of the producer and the dealer and helped to create a perpetual "seller's market." *The householders of New England and the Northeast while rightly asking for relief against the menace of an interruption of the coal supply, should realize their collective power to influence prices.* The most paternal of governments cannot relieve the individual from the consequence of his own negligence. There rests upon the householder the responsibility of buying coal when coal is to be had and also the responsibility of casting about for supplementary fuel.

One of the immediate causes of the distress in the Northeast last winter was the hesitation of householders to accept substitutes until cold weather was upon them and anthracite was literally not to be had. The consumer can create a demand for supplementary fuels that will both increase the supply and lower the price. Under present levels of price the Commission is convinced that many householders by a little attention to the subject can materially reduce their coal bills. Those who cannot burn coke or bituminous coal outright can frequently use a mixture of coke and pea coal or a mixture of the steam and the larger sizes of anthracite.

Building up the demand for substitute fuels is one form of insurance against combinations of labor or of capital and the consequent rising prices.

Review of Industrial Relations

Civil Rights.—The subject of the breach of civil rights, resulting in a general cessation of labor in all those fields where contracts have been made with the United Mine Workers of America, must be left for analytical presentation to the final report, since it involves the bituminous as well as the anthracite fields. But as these strikes or lockouts, whatever they may be, have affected the anthracite industry as well as the bituminous industry, a general reference to the situation is not inopportune.

The principles that a man has a legal right to work free and unimpeded by threats, duress, coercion or restraint, when, where and for whomsoever he chooses; that a man has a legal right to employ and discharge as he pleases, and that men have a right to bind themselves together for collective bargaining touching wages and working conditions are freely admitted by everyone. These principles honestly lived up to would keep the open shop and at the same time permit the existence of the union. But as a matter of fact, the open shop in a unionized mine is open to the union miner and closed to the non-union miner, while the open shop in the non-union mine is open to everybody save a United Mine Worker. No opinion will now be expressed as to whether this condition has arisen from an attempt to unionize the mine and not the miner.

Without attempting to trace to its origin the first violation of the law to fix the primary responsibility for breaches of the law and starting the trouble, it will be sufficient to say that no side, whether union or non-union, can show absolutely clean hands in keeping and helping to enforce the civil rights of American citizens. These breaches of the law have doubtless arisen upon the theory that vast aggregations of capital and vast aggregations of labor have just the same rights as the individual, but the Commission believes that the innocent bystander has some rights which both of these contending forces are bound to respect. Corporations, whether *de facto* or *de jure*, are not individuals, and

they may not exercise unrestrained the natural rights of man. If, as the Commission believes, the mining of coal is clothed with a public interest, then both sides must—peaceably and voluntarily if they will and under compulsion if they will not—deal with each other in the light of the general welfare of the American people; and while the Commission believes there is ample authority to punish a conspiracy of either operators or miners, or both, directed against the general welfare of the people, if there be not such legal authority, it will be recommended for enactment in the Commission's final report.

We shall not attempt to give a list of button strikes or other strikes called for the real or alleged purpose of rectifying grievances under the existing contract. The anthracite mines are theoretically open mines. It is not the public's concern but the union's business whether a man pays his dues to the union or not, yet if he does not pay his dues and wear his button in proof thereof, a strike takes place and is not usually settled until he has paid his dues. By the existing contract a settlement of disputed questions of fact arising under its terms is provided for the very purpose of obviating strikes, yet strikes have occurred over these facts. They have not taken place at the instance of the general or district officials of the United Mine Workers; nevertheless they have occurred.

It is not possible to determine the motive in the mind of each man who votes for a strike, whether it is economic or political, but it is fair to assume that the vast majority of the violations of agreement not to strike have been by those who were interested in the purely economic situation. Men in America have economic rights for which they are justified in contending and they have political views which they are authorized to advocate. But they have no right to pretend they are contending for economic rights if their aims are purely political. Political questions should be settled by American citizens, and economic questions by individuals, corporations and labor organizations. An alien has as much right as an American citizen to strike for wages and working conditions and as such has a right to join with American citizens; but it is to the interest of the Republic that aliens should seek citizenship.

Persons, firms and corporations doing business under the protection of the laws of this land owe it to be diligent in their efforts to educate and naturalize the aliens whom they employ and for whose presence here they have been in too many cases responsible. It appears that less than one-half of the 78,000 foreign-born miners have sought citizenship, notwithstanding 68,000 of them have been in this country

over ten years. A rebirth of the American idea is needed in the anthracite region, and great care should be exercised to differentiate on questions which may lead to a strike as to whether they are economic or political in their nature. The alien should be permitted to exercise every economic right of an American citizen, but no political right until through naturalization he assumes allegiance to this country.

Strikes have occurred in violation of the agreements entered into not to strike, but fairness compels the statement that there has been justification for some of them in human nature arising over delays in investigating complaints and insufficient personnel to accomplish speedy results.

Neither individuals nor aggregations have the right to make a contract and ignore its obligations, and collective bargaining implies collective keeping of the bargain. In the anthracite region the union has won its fight for collective bargaining and now exercises a practical monopoly. The union must justify itself. If it cannot furnish wise leadership and assist in the efficient conduct of this industry, punish the wrongdoings of its own members as freely as it demands the punishment of wrong at the hands of the operators, it will not justify its existence.

Similarly, by making use of the experience in other industries and the best in their own industry, the operators have an opportunity to concentrate on the human problem of men at work. The best standards of general industrial practice imply continuous cultivation of good relations between the employer and his employees, by organized efforts to build up industrial good-will and by the selection and training of foremen and other employees. Organized efforts to promote such contact would tend to correct the sad effects of contacts based chiefly on grievances, and, needless to say, this would weaken the forces making for strife by strengthening the normal co-operative motives. Industrial practice has demonstrated that the best results are to be obtained where executive responsibility for personnel and labor matters is concentrated in one responsible executive whose attention is devoted chiefly to them.

Pending Negotiations.—Just now, when in accordance with the agreement made between the anthracite operators and the United Mine Workers of America, a new contract is to be entered into in the light of the recommendations of this Commission, it calls attention to certain facts, not to stir up a controversy about them but in the hope that a general amnesty may be declared in the industry, the slate wiped clean, and negotiations had looking toward justice to both miner and operator and a continuous and uninterrupted supply to the users of anthracite.

There is no adequate provision for the consideration of specific disputes at the mine nor for insuring that all employers handle the question the same way. The union participates by its district representatives, but the employers have no corresponding agent to represent them in the early stages of the disputes. In this particular this industry is not abreast of other well-organized industries. The Conciliation Board has done valuable work since it was created, in 1903, but as the years have gone by it has lost some of its effectiveness; and partly through its own fault.

Recommendations.—(1) *The Commission recommends that in the next agreement there should be a provision for a continuing umpire and that he or an assistant named by him should sit with the Conciliation Board at all its meetings, but without a vote.*

(2) *In view of the delays that have been caused by the absence of members of the Conciliation Board, alternates of like standing in the industry should be selected with authority to act in the absence of the original member.*

(3) *The operators' group should appoint a full-time representative and all necessary assistants to consider jointly at the mine with the district officers of the union each case before it is appealed to the Conciliation Board in the hope of securing a local agreement, arriving at a better understanding by each side of the difficulties and problems of the other, and thus producing a mutual feeling of respect for the other's opinions and each obtaining the outlook of the other upon the problems.*

(4) *So many changes have taken place since 1903 that the agreement should provide for a joint committee to work out a restatement of the whole agreement in the terms of today, and this agreement should be specific enough to be the code by which all persons having anything to do with the settlement of grievances shall be bound.*

(5) *If the Board of Conciliation does not clearly understand the facts involved in any case, it should appoint an examiner from each side immediately to investigate and furnish it with all the facts.*

(6) *The agreement should provide for penalties for the breach thereof by either party, and the method by which such penalties are to be enforced.*

(7) *The renewed agreements have too rigidly retained the practices and conditions of 1902 and have not had adequate flexibility. An industry which is necessarily constantly changing cannot tie itself inflexibly to conditions of twenty years ago without hampering the management and working injustice to miners. A second joint committee should be provided for in the next agreement and directed to make an engineering study of the elements of the job of mining anthracite coal, for the purpose of building up a scientific and more equitable basis for rate making. Until, however, such committee shall disclose fundamental facts which shall form a decidedly better basis, the old 1903 base should, of course, be retained, for however inequitable the basis of 1903 with its subsequent modifications is, it is better than no basis at all.*

(8) *The expiration of the contract in the anthracite region should not coincide with the expiration of that in the bituminous region. The contract should run for a definite period of time with the proviso that it shall be deemed to be renewed for a like period of time except as to such provisions thereof in which notice of a desired change shall have been given by either party to the other at least ninety days before the renewal date. Upon these proposed changes the parties shall immediately confer and if, sixty days before the date fixed for the renewal of the contract, they have been unable to agree, they shall report such fact to the President of the United States, specifying clearly the controverted points. The President shall thereupon appoint a person or persons to inquire into and make public a report upon all the relevant facts in controversy before the date of such renewal shall have arrived.*

The Commission recommends at this time no punitive legislation. It awaits with interest whether the next agreement entered into shall show a co-operative spirit, a clear idea of partnership on the part of all concerned in it, and a proper conception of the rights of the American people. These rights in the anthracite region are no different from those in the bituminous, and the judgment of the Commission will be very largely affected by what takes place in the present negotiations. It calls attention to the fact, however, that some of the material from both the operators and the United Mine Workers presented to it is calculated even if not intended to inflame the public mind for or against one of the parties. This is more applicable to the bituminous controversy.

These charges and counter-charges are most unfortunate at this period of negotiations. Instead of preparing the public mind as to what will be real justice to the operator and the miner and what will stabilize the industry, there has been too much of epithet, too little of argument. The Commission recommends that each side forget past differences and grievances and attack the problem in the spirit of justice and fair dealing, not only between themselves but with due regard for the rights and sensibilities of the American people. The Commission hopes that a constructive view will be taken, not controversial in its character, so as to assure a continuous output from the anthracite mines and the scrupulous keeping of the agreement. If it must fix responsibility because the old order has not changed, it cannot do so without taking into consideration the bituminous industry.

In conclusion the Commission invites attention to the specific recommendations contained in this report on the following subjects:

- (1) Government regulation.
- (2) Publicity of accounts.
- (3) Authorization of President to declare national emergency.
- (4) Uniform standard ton.
- (5) Re-examination of anthracite freight rates by Interstate Commerce Commission.
- (6) Reduction in number of sizes.
- (7) Inspection of quality.
- (8) Larger use of substitute and supplementary fuel.
- (9) Excessive hours.
- (10) Readjustment of wages of miners' laborers and of the conditions of their employment.
- (11) Readjustment of royalties.
- (12) Power to punish conspiracy against general welfare.
- (13) Personnel manager.
- (14) Assimilation of aliens.
- (15) Alternates for members of Conciliation Board.
- (16) Continuing umpire.
- (17) Examiners for Conciliation Board.
- (18) Full-time representative of operators.
- (19) Joint committee to prepare industrial code.
- (20) Joint committee to secure scientific analysis of jobs.
- (21) Penalties for breach of agreement.

Respectfully submitted,

Where to Build Our Mining Towns and What Type of House We Should Erect in Them*

Build in the Creek Bottoms and Straighten Out and Deepen Creek for Safety, Space Economy and Sanitation—Keep Houses Near Mine—If Necessary to Restrict Town Area, Erect Apartments

BY THOMAS F. DOWNING, JR.

General manager, Logan County Coal Corporation, Lundale, W. Va.

IN A LARGE area of West Virginia and Kentucky many of the mines are small because the companies lack space on which to build large towns and make the necessary improvements. They often have nothing but a little bottom land cut up by the streams and ravaged at times of high water.

The question arises whether they are using to the best advantage all the bottom or level land they have. Where the mountains are steep and the valleys narrow the streams are subject to sudden increases in volume. In most cases the bed of the creek is shallow and when the stream rises suddenly it spreads out over a large part of the bottom land.

When the floods are unusually high the stream often does many thousands of dollars' worth of damage to property, and so completely deprives many of the inhabitants of their peace of mind that they move away to places where such hazards do not exist. At such times of high water the creek usually changes its course and, in doing so, often carries away some of the land that was considered high and safe. It is obvious, therefore, that if the investments of mining companies in such places are to be protected, if communities are to be permanently established and if a maximum tonnage is to be produced, the bed of the stream must be so

modified that the water will be controlled at its flood stages.

What is the best, most economical and lasting method of doing this? In my opinion the most practical and economical way is to dredge the creek with steam shovels. An original expenditure of about \$3 per lineal foot is about all that is necessary under the conditions to carry approximately three million gallons per minute at a velocity of from 15 to 17 ft. per second. This cost includes the leveling of the spoil.

In 1917 our companies† and those working adjacent properties lost several buildings and decided to try to protect the properties by dredging. Several of the neighboring companies entered into the project with us and we dredged approximately nine miles, at the same time making about seven miles of roadbed above the water level and four miles of railroad grade. Sufficient material was procured from the creek to level and grade part of the house sites. Bids were called for, but the contractors were afraid of floods, and consequently the bids were too high to receive consideration. Three 60-ton shovels were rented with specially constructed booms for excavation, and three smaller shovels were leased to take care of the spoil. The project was attacked at three different points, the work being continued through the winter of 1917 and being completed in 1918.

The winter work added greatly to the cost, and I would not advise anyone to do this work in the winter if that can be avoided. I also would not advise dredg-

*Article entitled "Where to Build Our Mining Towns and How to Build Them," read before the summer meeting of the West Virginia Coal Mining Institute at Clarksburg, W. Va.

NOTE—Headpiece shows channel excavated at Lundale, W. Va., and the double line of houses which the dredging of the creek made feasible. This picture was taken four years after the work was completed. The stream formerly meandered all over the bottom, leaving no room for houses. Observe the fine public road which parallels the stream.

†Lundale Coal Co. and Three Forks Coal Co.—EDITOR.

RECLAIMING THE CREEK BOTTOM NEAR LUNDALE BY DEEPENING THE CHANNEL WITH

In this section of the work the channel was carried up the center of the bottom, as houses already had been constructed, thus preventing the choice of the foot of the hill as a location. The two shovels are side by side so that the spoil is put into position

as fast as it is cast up into the heap. Thus if a flood comes no risk of having the material washed back into the channel need be faced. It is clear that the houses that line the creek are occupying the flood channel of the stream. Until the creek was

dredged, times of high water were discommoding even when not actually perilous. Furthermore, the lowering of the stream bed improved sanitary conditions by providing good drainage either through the soil or through pipes. Stream rectification,

ing unless the small shovel goes along with the big shovel, the first disposing of the spoil as fast as the latter excavates it. In one of the sections a small shovel could not be procured and in order to get the section completed before the high water came the bed of the stream was dredged a distance of about 3,000 ft., the material being placed on the side of the creek.

The flood came and washed all this spoil back into the creek, and it had to be dredged out all over again. The shovel was covered half way up the boiler, and it had to be dug out by hand. In another instance the flood turned over the large shovel and cut the bank from under the small shovel, letting it drop into the stream with the big shovel. All the expense connected with these unfortunate occurrences or with our lack of foresight—call it what you may—is included in the cost given later.

Suitable labor could not be obtained for this work, and the contractor from whom the equipment was rented was allowed a few cents per cubic yard excavated, in return for which he was required to keep a full crew on the job at all times. The rental was \$500 per month each of the 60-ton shovels and \$350 per month for the smaller shovels, the lessee to keep up the shovels while using them and paying the freight to and from the job.

Table I shows the cost per cubic yard under different classifications.

This dredging was completed during the early part of 1918. During the excavation period more water passed through the completed channel sections than in the making of the estimates had been anticipated as a maximum. No damage has been sustained from flood or high water since the work was completed, and hundreds of houses have been built in places which would not have been safe for such buildings prior to the dredging.

This particular job has shown us that the cross-section of the creek can be three-fourths of what it was before dredging and still allow a safety factor of from 15 to 20 per cent. The velocity of the stream was increased at one point from 10 ft. per second before dredging to 17 ft. per second after dredging.

In laying out a dredging project it is advisable to keep the creek as near the mountainside as possible, as this allows the recovery of a maximum area of ground. The channel should be kept as straight as can be arranged and where curves are necessary a slightly greater cross-section area should be afforded. It will be found that there will be little cutting of the bank except on curves. Where these occur they should be protected in some manner.

If the bottom of the channel is near solid rock the best protection, of course, is a wall. It is not safe, however, to build such a structure unless it rests on solid rock, for the greater part of the water will run along the wall and in time will undermine it. Where solid rock is to be found only at a considerable distance under

A 60-TON SHOVEL AND SPREADING THE SPOIL WITH A SMALLER MACHINE

and deepening is a problem which most operators in mountainous regions have to face. The difficulty is as perplexing in Utah as in West Virginia and Kentucky with the exception that in the first-mentioned state conditions seem perfectly safe

and improvement a flagrant waste of money until a cloudburst comes and what was a mere trickle of water is converted in a few minutes into a raging torrent the full width of the valley and capable of carrying everything before it. In many cases where

streams pass over coal mines the formation of a better stream bed by dredging will save the workings from much water and make possible the excavation of the coal over a larger area. It should not be delayed till flooding makes it necessary.

the floor of the channel the curve should be protected by large loose rock. This rock presents just as much friction as any other part of the bed and when undermined merely sinks deeper, affording still better protection.

WITH A LITTLE WORK CHANNEL WILL DEEPEN

After the job is completed the channel, given proper care, will continue to deepen. Every wet season washes dirt from the channel and exposes new boulders. If these are not renewed the channel probably will fill up in the next wet season, but if a few men are put to work in the channel in the summer throwing out these boulders, the stream under most conditions will continue to cut deeper. The rock thus removed should be thrown to the foot of the bank, thus forming a better protection from cutting. While the actual dredging is going on the shovel should put all convenient large rock at or near the foot of the slope.

In some places the channels have cut 3 to 4 ft. but at other places only about one foot. The least cutting usually is found just after leaving a bad curve, where the velocity of the stream is reduced.

Aside from its advantages from the viewpoints of safety and reclamation, dredging has been of inestimable value to us from a sanitary standpoint. The bed of the creek is now enough below all of our houses to make it easy to run our sewers into it. It is so much lower than the surrounding land that the water seeps through to the creek, and contagious diseases have been practically unknown in our camps since dredging was completed.

The material removed by the dredging consists principally of sand and gravel. This material is excellent for road-making purposes as it drains well. Where we formerly crossed through the main creek fifteen

times in going from one mine to another, a distance of five miles, we now have a good county dirt road above water level at all seasons and we have had to build only two short bridges.

After the ground is made safe and prepared for the town comes the question as to the kind of construction to be employed. What it should be depends largely on two conditions: How much can justifiably be spent on the town and how long will the plant last? The plan is influenced also in some measure by the proximity of the mine village to a larger and well-developed town and by many other features which are peculiar to the particular territory under consideration.

Before any construction is commenced it is important that the location be cleared and properly graded. This will add much to the appearance of the town and will be much less expensive than if an attempt is made to do it after the houses are built. After people move into the houses it will not be necessary to annoy them by the blasting of stumps and rock and, furthermore, water cannot collect in stagnant pools to breed disease.

Much has been written on the detail of construction and architecture, and I will not dwell on that subject but merely state that no matter what you are going to build it would be well to keep in mind the fact that American standards of living are continually becoming higher and your construction should reflect that fact.

We must watch lest we build too far away from the mine if we are to receive the maximum efficiency from our dwellings. I have found that a house which is built a mile away from the mine mouth is only about half as efficient as a house which is built nearby. I have found that in the winter it is difficult to keep tenants in the more distant houses, and that all of them want to live near the drift mouth so that the men will be close to their work in bad weather and their families

VALLEY AT THREE FORKS, FIVE MILES ABOVE LUNDAL

As the watershed at this place is much smaller than at Lundale the excavation has been made shallower. The spoil from this channel has been used to make a railroad fill which parallels the creek as does the public road in the headpiece of this article. That road, however, cannot be seen in the illustration.

will be near to the store and welfare buildings, which usually are centralized.

The question which has perplexed me is what shall we do to get a higher efficiency from our houses where the valley is narrow and where any necessary expansion would seem to make it obligatory to go a great distance up or down the valley if space is to be found for dwellings. I first thought of building tenements, but our people are so mixed that the housing of a number of families with a common entrance and with common

stairways and hallways would be of extremely doubtful success. A short time ago I thought of building such a tenement right at the foot of the mountain with no stairways or hallways. A road or path would be graded at each floor level and a fireproof bridge or walkway constructed from the hill contour to each apartment, thus making for each a private entrance.

We have prepared plans also for a four-story twenty-apartment house to be constructed of steel, tile and concrete and fireproof throughout. We would install

SECTION OF APARTMENT HOUSE DESIGNED FOR A MINING TOWN

Where the level ground is limited and people, not having trolley facilities for reaching the mine, the store, the church, the movie show or the dance hall, must travel long distances afoot, the proposal has been that mine villages be provided

with fireproof apartment houses having modern conveniences. Where the company supplies coal for a small given charge per month (usually at a wholly inadequate figure) the apartment house will save fuel and reduce this loss. The apartment sug-

gested is to be four stories high. It is believed that the cost of this large building will be about the same as that of a number of smaller dwellings that will house an equal number of families, but it will take less space and provide greater comfort.

steam heat, cold water and connections for hot water with hot-water tanks, lavatories and shower baths. I show herewith a plan giving the details of the arrangement and the size of rooms together with location of chimneys, bath, etc. You will note that one chimney from the ground up will serve eight kitchen stoves. The plumbing is so arranged that one coil of pipe will serve eight families.

We have not gone far enough to obtain an exact cost on such a building but from what information I can gather it should cost between \$45,000 and \$48,000. I think it is practically necessary to make such a building four stories high, for only by that means can it be built at a cost comparatively little greater than would be incurred in building separate structures to house the same number of families.

A large saving on insurance and coal would be effected. In mining towns employees usually are charged

\$1 per month for all the coal they wish to burn. When houses are equipped with grates the company loses much money on the coal furnished. Under this arrangement much of the cost would be saved, for a centralized heating plant would be provided. The building proposed would give the people all the conveniences possible and for twenty families it would occupy about the area that two single houses would require.

In discussing this proposition among the members of our organization it was pointed out that the people living in such a building would have no gardens. We therefore made a canvass of our largest town and found that only 46 per cent of the people who could have gardens really had them. It is, of course, not the idea to build the entire town along these construction lines, but only to take care of the tenements necessary after the town has been built up in the usual manner within an economical distance from the plant.

Southwestern Operators Launch Campaign in Newspapers to Educate Public

United as "The Associated Coal Bureau of Kansas City," operators, jobbers, wholesalers and retailers of Kansas City have instituted an intensive advertising campaign in an endeavor to bolster the midsummer domestic market. The bureau carries advertisements of from one-fourth to one-third page in one of the Kansas City newspapers, explaining something of the hazards of the coal business and the factors which determine the retail price.

As a sample of the type of matter employed, soon after the submission of the report of the Southwestern Interstate Coal Operators' Association to the U. S. Coal Commission, the bureau had reprinted in its "ad" a facsimile of Washington press dispatch to the *Kansas City Star* summarizing the association's statement.

By the side of the facsimile appeared the bureau's comment: "This clipping, which is a résumé of the report of the Southwestern Interstate Coal Operators' Association, shows the coal problem as it now presents itself to the producer in this territory. It explains the 'why' of increased coal production costs and demonstrates the reason why you cannot expect lower coal prices in the near future. Many of the troubles cited are peculiar to this Southwestern territory—some are nation-wide in their scope—yet all are facts with which coal users should be acquainted. . . ."

The campaign has not yet lasted long enough to determine what effect it will have upon the local market, but it has the support of most of the coal men of Kansas City.

Coal Prospectors Busy in Wyoming; Leasing Active in Utah

Up to June 1 a total of 419 coal-prospecting permits had been issued by the Department of the Interior on public lands of the United States. Coal prospecting is most active in Wyoming, where 103 permits had been granted. Colorado, with 90 prospecting permits, was second in this respect; Montana, with 51 permits, was third; Utah, with 39, fourth; and Nevada, with 34, fifth. Thirty permits had been issued in New Mexico, 25 in Oregon, and 21 in Washington. Of the 78 leases of coal-mining operations, the largest number, 26, is in Utah. Sixteen leases have been granted in Colorado, 12 in Wyoming, 10 in North Dakota, and 9 in Montana.

A total of 980,000 acres of coal lands in 15 Western states have been leased for mining operations, and this acreage is increasing rapidly. These figures do not include the Territory of Alaska, where operations are conducted under a different system.

Coal is now being mined from government land in Washington, Montana, North Dakota, South Dakota, Wyoming, Utah, Colorado, and New Mexico. During 1922 a total of 101 mines produced coal on leased public lands.

Technical supervision of these coal-mining operations, with special regard to maintaining maximum standards of safety and efficiency, is directed through a mining supervisor of the engineering staff of the Department of the Interior.

In the past, because of the prior development of mines and industries in the Eastern states, coal mining on the Western public domain has been overshadowed by private industry; in the years ahead the leased mines may well become the more important. Every effort is accordingly being made by the Interior Department to establish the new system on a sound basis, to protect the public interest in safe and efficient mining, and not unduly to hamper initiative in operation.

French Coal Output and Consumption

The fuel consumption of France in April (and the first four months of this year) was as follows, in metric tons:

COAL		
	In April, 1923	First 4 Months of 1923
Output.....	2,999,617	11,637,998
Imports.....	1,926,563	7,598,514
	4,926,180	19,236,512
Exports.....	96,675	807,439
Consumption.....	4,829,505	18,429,073
COKE		
Production of collieries' coke ovens.....	156,035	558,996
Imports.....	243,989	939,155
	400,024	1,498,151
Exports.....	21,298	109,521
Consumption.....	378,726	1,388,630
PATENT FUEL		
Production of briquets works attached		
To collieries.....	214,342	994,502
Imports.....	44,648	248,052
	258,990	1,242,554
Exports.....	27,412	103,632
Consumption.....	231,578	1,138,922

In order to arrive at the exact figure for total French consumption, the quantities transformed into coke and briquets should, of course, be deducted from the coal output.

The Office des Houillères Sinistrées (French distributing agency for indemnity coals) has received from German occupied territories the following fuel, in metric tons:

	Coal	Coke	Lignite	Briquet
In April.....	62,900	131,000	3,400	
From May 1 to May 28, inclusive.....	110,400	159,900	4,400	

According to another source there was forwarded from Germany to France and Luxemburg (the above figures apply only to France) during the whole month of May 137,700 metric tons of coal, 193,000 metric tons of coke and 10,000 metric tons of lignite briquets.

During the first week of June 37,275 metric tons of American coke arrived at Dunkirk, as against 25,600 metric tons during the preceding week.

Problems of Operating Men

Edited by
James T. Beard

Working a Double Seam of Coal

Experience in Working Coal Seams with
Forty Inch Slate Parting Shows Advantage
in Use of Jeffrey Arcwall Mining Machines

WHILE employed as superintendent of mines for the Consolidation Coal Co., at Jenkins, Ky., I had several sections, in Mine 204, where the conditions were similar to those described in the inquiry that appeared in *Coal Age*, May 10, p. 762.

The inquiry comes from a superintendent at Staub, Ky., and asks for the cheapest and safest manner to work a double seam of coal with a view to obtaining a maximum extraction of coal, at a minimum expense for deadwork.

The inquirer states that his bottom seam, a bench 52 in. in thickness, is separated from the top seam by 30 in. of slate parting, which is of such a nature that it cannot be held up for any length of time. The upper seam is coal of good quality and 30 in. thick. In the Jenkins mine I have mentioned, the parting slate ran up to 40 in. in thickness and the method of extraction I am about to describe proved very successful.

Under the conditions mentioned in the inquiry, I would suggest driving all entries 12 ft. wide and turning rooms on 50-ft. centers and widening to 20 ft., leaving 30-ft. pillars between the rooms. My experience has taught me that advantage is gained by the use of the Jeffrey arcwall mining machine.

MINING IN THE SLATE SAVES COAL

If the slate parting is sufficiently soft, as I believe is the case in this instance, the cutting should be made in the slate just on top of the lower bench of coal, as this will save 5 in. of coal being reduced to bug dust.

At Jenkins, we succeeded in cutting from 75 to 80 per cent of the places in the slate parting. The only places cut in the coal were those where the parting was so hard that the bits on the machine would not stand up to the work. Also, the hard cutting caused an excessive heating of the armature of the machine, particularly if the parting was of a flinty nature.

In my opinion, loading out all of the slate when driving the entries proved a hundredfold saving, by keeping good clean haulage roads, which always means increased production and reduced cost. Gobbing the slate at the side of the track generally resulted in more or less of it slipping down on the track and reducing the efficiency of the haulage, which is the most important factor in coal-mining operation.

From the statement regarding the soft condition of the parting in this case, I would not consider it to be safe for men to work any distance under the slate. If it did not fall readily, I would blast it down and

work out the full height to the sandrock roof, with each cut made in the face.

However, all the coal of the lower bench should be loaded out before the slate is allowed to fall. For that purpose, it should be well timbered till the lower coal has been loaded out. The posts are then drawn and the slate allowed to fall or blasted down. In the rooms, the slate should be gobbed on the side of the track opposite to the pillar that is to be extracted.

To my mind, this is the most practical way to work a seam of this kind where the slate parting is too soft for a permanent roof, and the upper bench of coal is of such quality and thickness as will justify the handling of the rock separating the two seams.

J. W. POWELL,

Charleston, W. Va.

General Rock Contractor.

ANOTHER LETTER

IN LOOKING through the issue of *Coal Age* for May 10, I became interested in a letter of an inquirer (p. 762) regarding the working of a double seam of coal containing a slate parting 30 in. in thickness. The inquirer wanted to know the cheapest method of mining these two seams, in respect to the handling of the large amount of waste.

In my opinion, the only practical method to adopt, in this case, would be to drive the rooms with the road close to the straight rib. The rooms should be turned 8 ft. wide and driven a distance of 10 yd. before widening out to a width of 24 ft. In doing this work, the stone should be loaded out; but, after widening the room, there will be plenty of room to gob the stone.

DISPOSAL OF WASTE IMPORTANT FACTOR

Thirty inches of stone is a large amount of material to handle with due regard to economy of operation. It is not practical to consider loading this waste into cars and hauling it out of the mine, as that would largely increase the cost of production and eventually close the mine by putting it on a non-paying basis.

It is of the utmost importance, therefore, to stow the slate at the nearest available point and avoid the expense of hauling it out of the mine. The inquirer has stated that the nature of the slate is such that it cannot be supported for any length of time, which makes it necessary to consider how it can be handled to the best advantage. For that reason I would work these two seams as one.

By following this plan, all the coal, both top and bottom, will be taken out as the room is driven up. I would cut the face with a shortwall machine, loading out the bottom coal, then dropping the stone and stowing it in the waste, before taking down the top coal. This plan eliminates the danger of working under the stone, as stated in the reply to this inquiry.

—, Pa.

ALEXANDER DENHOLM.

Extracting Coal in a 30-Ft. Seam

Seam divided into three measures—Headings not driven vertically over those in seam below—Extraction in each lower seam kept in advance of that above.

SOME time ago I noticed, in the Inquiry Department of *Coal Age*, a request for the most suitable method of working a 30-ft. coal seam. If I remember rightly, the inquiry came from a mine in Utah or Colorado. At that time, I was unable to offer the suggestion I had in mind; but, though late, the following brief outline may be of interest.

Without referring to the question of the depth of the seam below the surface (I do not recall that mention was made of that matter in the inquiry), my plan would be to divide this thick seam into three measures, with respect to the extraction of the coal. For example, making the two lower measures 12 ft. in thickness will leave the upper measure 6 ft. thick, which will afford a good opportunity for timbering the overburden.

HOW THE WORK IS STARTED AND CONDUCTED

Work should be started by driving the main headings on the slope of the seam, if any, keeping these well in advance of the headings above. In the accompanying

SHOWING GENERAL ARRANGEMENT OF HEADINGS

figure, I have shown a general cross-section of the main headings in the several measures. It will be observed that these headings do not lie vertically, one over the other, but alternate in the different measures.

The arrangement offers a good support to the floor of each heading and has the effect of overarchng the weight. The same general plan is followed in driving the butt headings to the right and left of the main slopes or entries. These butt headings are driven in pairs on, say 300-ft. centers. The rooms or chambers are driven 15 ft. wide, on 24-ft. centers and follow the same alternating plan with respect to the chambers in the next overlying measure.

When all the headings have been driven to the limit and the chambers likewise, in the several measures, the work of robbing the pillars is first begun in the lowermost measure, the robbing advancing about 10 yd. ahead of similar work in the measure above. If properly conducted, this method will not require the use of much timber, except in the uppermost section or measure. I should have stated that all entries or chambers are driven 8 ft. in height, leaving 4 ft. of coal between the measures, as indicated in the figure.

Parnassus, Pa.

C. W. ATKINS.

[The correspondent has not made clear, in the method he has outlined, regarding the work of robbing, which he states is started first in the lowermost section and kept some 10 yd. in advance of similar work in over-

lying sections. The question of support for the upper measures, as the robbing progresses below would appear to be a difficult matter and should have been explained.—EDITOR.]

Measurement of Men

Display of assumed capabilities no guide to ascertaining the true worth of men—True merit in men needs no advertisement.

SOME recent occurrences have recalled to my mind a statement made by a former writer, in *Coal Age*, to the effect that a certain mine manager once expressed himself as preferring to choose the man who made a display of his capabilities, rather than one who made no such display but was willing to be judged by his work. It is hard for me to believe that many successful managers hire men on their display of supposed capabilities.

Now, it may be to an applicant's credit to be able to acceptably present his experience and refer to his record in previous undertakings, very much after the manner of those characteristics that make for good salesmanship. However, a good manager will look a little deeper; and, by questioning, ascertain for himself the probable fitness of the man for the position he has in view. There must be something more than the mere claim to capability if a wise choice of men is to be made.

MANY CERTIFIED MEN HAVE FAILED

The fact that a man holds a certificate of competency does not always mean that he is capable of filling the position for which he applies. There are certified foremen, assistant foremen, firebosses and others, an investigation of whose record would show that they had practically failed; and yet each, in his own estimation, is capable of filling the position he desires. So confident is the applicant of his own ability that he is prone to make a display of what he can do, instead of modestly pointing to what he has done.

In the selection of men for responsible official positions in mines, I would be more favorably inclined toward the man whose record shows that he has had a practical experience and who has every appearance of being cool headed and observant of things about him, than toward the man who flaunts his certificate and boasts of what he can do in various situations. I would not expect a man's ideas always to conform to my own; but when overruled he should show a disposition to work with the same zeal as when following his own plan.

ABILITY TO PROMOTE HARMONY A CHIEF FACTOR

The real merit of a man needs no verbal exploitation. One of the chief elements of a successful foreman is his ability to promote harmony among the men in his charge. The practical man knows that harmony and goodwill win the day where nothing else can avail. I have observed many mine superintendents and foremen who were worth all the company paid them, solely by reason of their ability to maintain harmony in the camp.

It used to be said that, "men do not always get what they deserve." But, that day is now past and the saying is suggestive of "passing the buck." As a matter of fact, we get nothing that is not coming to us. On the other hand, we always get what comes to us as the result of our own acts and thoughts. A man

is taught many a lesson by his own failures, though he may not see it that way at the time.

Speaking of meriting promotion, the first lesson a man has to learn is to measure himself correctly, and be able to shoulder the blame for his doing, instead of trying to pass it on to the other fellow. A grumbler is never in line for promotion, as he will spend too much time criticising the man above him to really do any constructive thinking himself.

Many years ago I was in a crowd of men who were discussing the promotion of a mutual friend, when a newspaper man made a remark that I have never forgotten. He said, "You seldom see a man hold a position long that he is not capable of filling."

Speaking for myself, I am not satisfied with my own progress. However, I am learning things, each day, that have been handicaps to a more rapid progress in my past. Candidly, I realize that I am where my own actions have brought me. That to which I have attained is the result of my thinking. I like to regard our thoughts as being fully recorded in our minds, making each one the product of his majority thoughts.

Neither money nor position is the full measure of a man's success in life. True success is attained by doing each day's recurring tasks better and more thoughtfully than before. Then, promotion will come when we are prepared for its greater responsibilities. ELKO.

Examination Questions Answered

Miscellaneous Questions

(Answered By Request)

QUESTION—*The length of a main-and-tail-rope haulage is 7,000 ft. (no grade); the weight of the main rope is 0.8 lb. per ft., and the weight of the tail rope 0.6 lb. per foot.; the full cars weighed 6,000 lb. and the empty cars 1,800 lb., each; the train consists of 15 cars. What are the tensions on the main and tail ropes? If the average speed is 10 miles per hour, what is the horsepower due to the maximum tension of the rope?*

ANSWER—In the general arrangement of a main-and-tail-rope haulage, the main rope hauls the loaded trip from the inby parting to the shaft or slope bottom, or the tippie, as the case may be, at the same time dragging the tail rope which is attached to the rear end of the trip. The weight of this loaded trip is $15(6,000 \div 2,000) = 45$ tons; and that of the empty trip $15(1,800 \div 2,000) = 13.5$ tons. The average weight of the two ropes being 7 lb. per ft., the entire weight of rope, extending in and out of the mine (14,000 ft.), is $7(14,000 \div 2,000) = 49$ tons. Then, when hauling the loaded trip out of the mine, the entire moving load is $45 + 49 = 94$ tons. Assuming an average track resistance of, say, 20 lb. per ton, the average tension on the main rope is $20 \times 94 = 1,880$ lb.

On the other hand, when hauling the empty trip into the mine, the average weight of the entire moving load is $13.5 + 49 = 62.5$ tons and, for the same track resistance, the average tension on the tail rope is $20 \times 62.5 = 1,250$ lb.

At a speed of 10 miles per hour ($5,280 \times 10 \div 60 = 880$ ft. per min.), the horsepower due to the maximum tension on the rope is $(1,880 \times 880) \div 33,000 =$ say 50 hp., which is the power due to the maximum tension on the rope and takes no account of the efficiency of the engine.

QUESTION—*In a single haulage plane where 17 loaded cars weigh 4,200 lb. each and the hauling rope is 4,500 ft. long and weighs 0.9 lb. per ft., what is the tension at the moment of moving the full load, the grade being 3.2 per cent? If the train is hauled at a velocity of 10 miles per hr., what is the required horsepower of the engine?*

ANSWER—In this case the weight of the loaded trip is $(17 \times 4,200) \div 2,000 = 35.7$ tons. The weight of

the rope lying on the incline is $(0.9 \times 4,500) \div 2,000 = 2.025$ tons. This makes the weight of the entire moving load, at the moment of starting the trip from the bottom, 37.725 tons. Then, assuming a track resistance of, say, 15 lb. per ton, for both cars and rope, and adding a grade resistance of 20 lb. per ton, for each per cent of grade, or $20 \times 3.2 = 64$ lb. per ton, the sum of the track and grade resistances is $15 + 64 = 79$ lb. per ton of moving load. This makes the tension on the rope, at the head of the plane, when starting the trip from the bottom, $37.725 \times 79 = 2,980.275$, or say 3,000 lb.

A speed of 10 mi. per hr. is $(5,280 \times 10) \div 60 = 880$ ft. per min. Finally, assuming an efficiency of 80 per cent in the haulage engine, the horsepower of the engine required to haul this load at this given speed is

$$H = \frac{3,000 \times 880}{0.80 \times 33,000} = 100 \text{ hp.}$$

QUESTION—(a) *How is the horsepower of an engine determined?* (b) *The area of the piston of an engine is 500 sq.in., the mean effective pressure 30 lb. per sq.in. and the length of stroke 8 ft. If the engine is making 20 strokes per minute, what is the horsepower developed?*

ANSWER—(a) The mean effective pressure in the cylinder must be first ascertained from the engine card. Multiplying this mean effective pressure by the sectional area of the cylinder gives the total pressure on the piston. Finally, multiplying this total pressure by the piston speed in feet per minute and dividing that product by 33,000 gives the indicated horsepower of the engine.

(b) In this case, the total pressure on the piston is $30 \times 500 = 15,000$ lb. For an 8-ft. stroke and a speed of 20 strokes per minute, the piston speed is $8 \times 20 = 160$ ft. per min. Finally, the indicated horsepower of the engine is $(15,000 \times 160) \div 33,000 = 72.72$ hp.

QUESTION—*The horsepower of an engine is 175; how many gallons of water per hour will be consumed?*

ANSWER—The water consumption of an engine, as in boiler practice, depends on a number of items not stated in the question. These items are: the mean effective pressure in the cylinder, the dimensions of the cylinder and percentage of clearance. However, with an ordinary slide-valve engine such as is in common use at many coal mines, a consumption of 5 gal., per horsepower per hour, would be a fair estimate. On this basis, a 175 hp. engine of the type mentioned would require $5 \times 175 = 875$ gal. of water per hour.

QUESTION—*A motor is taking 45 amp. of current at a pressure of 500 volts; what is the horsepower?*

ANSWER—The output of this motor is $(45 \times 500) \div 746 =$, say 30 hp.

General Adoption of Automatic Substations at the Mines

Application of Automatic Features to Mine Substations—
Economic Advantages — Saving in Power, Attendance
and Maintenance — Description of Automatic Operation

BY J. E. BORLAND

General Engineer, Westinghouse Electric & Manufacturing Co.

FOR several years before the application of the automatic substation to mining service its position in the electric railway field had been firmly established by the success shown in reducing operating charges and improving service. Conditions in the railway industry had been such that an improvement leading to these results was of vital importance. While the mining industry was not confronted with this necessity to the same degree, the success of the automatic railway substation was logically followed by application of the same principle of operation to mining, as like results were to be expected because of a similarity in power requirements and distribution.

Both industries require the transmission of direct-current power over a considerable extent of territory, which often necessitates a large investment in feeder copper and distributed substations to maintain satisfactory trolley voltage. Although the haulage distance of the average mine is in general much less than that of an electric railway, the lower trolley voltage used in most mines because of safety considerations makes the two fields comparable in many respects. In both cases the load varies over a wide range, and the service is subject to more or less frequent interruption caused by excessive overloads or short-circuits, this being particularly true in mining service. That the advantages of automatic substation equipment under such conditions are being generally recognized is demonstrated by the rapid expansion in its use in mining substations within the last two years.

The first substation equipped with automatic control to be installed in an American mine was put into service in January, 1921, by the Lincoln Coal Co., at Nanty-Glo, Pa. The mine using this equipment is a drift opening having a main-haulage distance of more than two miles with grades against the loading trips throughout the entire length. The substation consists of a 200-kw. 250-volt synchronous motor generator set installed in a concreted room along the main haulageway about two miles from the drift mouth. Power is supplied through a three-conductor 2,200-volt cable entering the mine through a borehole.

The Lincoln Coal Co. substation is normally started and stopped by means of a small control switch operated by the first man entering the mine in the morning and by the last man out at night. By throwing a small double-throw knife switch on the switchboard, operation of the equipment is made entirely automatic, the substation starting when the trolley voltage is reduced below a predetermined value for more than 5 seconds, and shutting down when the load is reduced for a certain time interval. This installation followed very closely the practice of automatic control and protection for railway substations, including protection from hot bearings, overspeed, overheating, reverse current, reverse phase, low a.c. voltage and excessive overloads by the

use of current-limiting resistors. The substation has given entirely satisfactory operation since it was first installed, and through the improved voltage conditions obtained the haulage time has been considerably reduced and the mine capacity correspondingly increased.

Without doubt the principal stimulus to the use of automatic substations has been the direct reduction of operating expenses obtained by automatic operation. In general this saving is made up of several items which vary to some extent with local conditions, such as the size of the mine, cost of attendance, characteristics of power demand and equipment in operation.

The elimination of a regular attendant, of course, is the principal factor in the economy of the automatic substation. Where the substation location is such that a manually controlled equipment would require the presence of an operator at all times, automatic equipment will release him for other work, and the automatic operation and protection of the substation will be much more efficient than is possible with manual control. As the automatic equipment requires only short inspections at weekly intervals, the direct saving resulting from elimination of the operator amounts to almost the entire amount of his wages. In comparing the two types of substations the entire cost of periodical inspection cannot be charged properly against the automatic equipment, as a similar item is necessary with manual equipments for frequent inspections and attention by the maintenance crew. This reduction of labor charges will often show a saving sufficient to entirely wipe out the original cost of the automatic equipment in two or three years.

At many mines the substation is located so that it can be started and given intermittent attention throughout the day by a man employed regularly on other work,

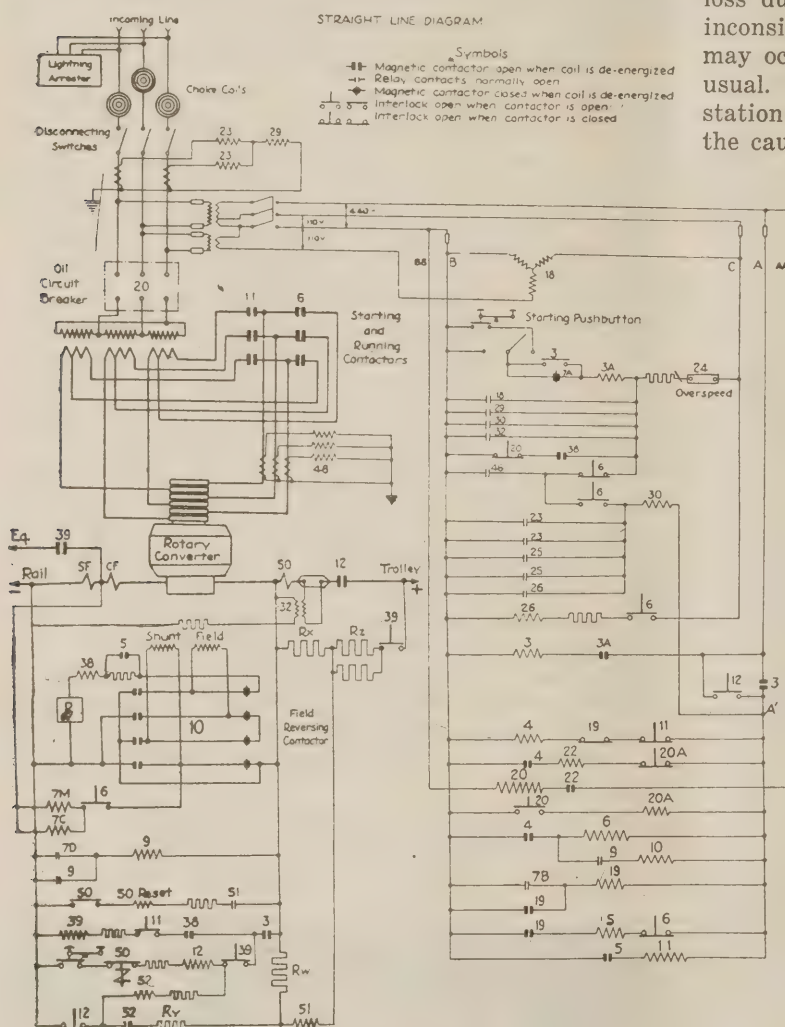

FIG. 1—LAYOUT OF UNDERGROUND AUTOMATIC SUBSTATION

This station is equipped with a synchronous converter, behind which is shown the complete switchboard for automatic control and protection.

such as a mine clerk or a hoist operator. This usually requires that the substation be placed farther from the load than would be necessary otherwise, with the result that the cost of installation is increased somewhat by the added length of positive and return feeders, and the trolley voltage and efficiency is reduced by the drop in the added feeders. Fairly satisfactory operation can be obtained with such attendance, in case the man whose duty it is to look after the substation is available at any time throughout the day. It often happens that his regular work requires him to leave the vicinity of the substation at various times, or conditions may be such that interruptions of service are not immediately observed.

The majority of interruptions of service from a min-

ing substation are caused by heavy overloads from locomotives or by short-circuits on the trolley system, which opens the d.c. circuit breaker. If the attendant loses no time in getting to the substation, service is restored with small delay by reclosing the circuit breaker, provided the trouble is cleared. The usual result of depending upon an irregular operator, however, is a considerable amount of time lost every day through delays in restoring power after interruptions. The losses chargeable to this source are in the form of reduced tonnage and consequent increased capital charges, idleness of motormen, trip riders and other day men, and the general dissatisfaction and confusion which follows an interruption in service for any length of time. While it is a difficult matter to estimate the loss due to such causes it is obvious that this is not inconsiderable when delays of ten minutes or more may occur several times daily, which is not at all unusual. This is entirely avoided by the automatic substation which restores service almost immediately after the cause of interruption is removed. In addition, the

FIG. 2

Wiring Diagram Showing Control and Protective Equipment

Automatic equipment used with mine converting machines makes possible the location of the substation at the most economical point for distribution regardless of the accessibility from the standpoint of attendance.

automatic equipment provides protection which is left to the observation of an operator in a manual station, so that a manually operated station without constant attendance is only partly protected.

Another pronounced advantage of the substitution of automatic control and protection for manual operation is that the substation is better adapted to be located at the most efficient point with respect to the load. This is of particular importance in the case of mines developed to a considerable distance from the opening.

In starting the development of a mine it is the usual practice to install near the mine opening a substation of sufficient capacity to meet the initial requirements. As the development progresses and tonnage is increased, the addition of locomotives, mining machines and pump motors frequently requires an increase to be made in the substation capacity. Furthermore, with increased distance of transmission, the voltage drop in the trolley circuit may be so large at times that it will become necessary to install heavy feeders to maintain satisfactory voltage to gathering locomotives and mining machines at the working face. Under conditions similar to these the addition of feeders can be obviated, and high voltage maintained at all motors by installing a substation as near as possible to the load center. This may be done by locating the equipment in an underground room and running to it a three-conductor alternating-current cable through a borehole, or the substation may be located on the surface, and the direct-current feeders lowered in the borehole. Fig. 1 shows a substation installed in an underground room. When the location is convenient to an alternating-current line, the cost of such an automatic substation will often be less than that of a similar increase of the existing substation and feeder capacity. In addition voltage conditions will be improved to a greater extent than would be practicable by adding to the outside substation.

VARIOUS WAYS OF STARTING AND STOPPING

Numerous automatic mining substations have been applied in this manner. These equipments are started and stopped in a variety of ways: by remote control from a circuit breaker in the alternating current feeder, by pushbuttons and a pilot circuit energizing a master relay at the substation, by a time switch adjustment to start and stop the station at desired times, and by combinations of these forms of control. In mining substations it is not considered desirable to follow the railway practice of starting automatically upon reduction of trolley voltage to a predetermined value and shutting down when the load has reduced, as there is no appreciable advantage in this refinement in mining work, and the equipment is simplified somewhat by its elimination.

In general a considerable demand for power is being made constantly by gathering locomotives, mining machines and pumps, to which is added the requirements of the main haulage locomotives so that it is generally desirable to have the substation running continuously to maintain high voltage at these various motors, in addition to being able to supply without delay any sudden overloads. In substations consisting of two units it is the usual practice to provide for automatic starting of the second machine by a thermal relay in case the load is such that overheating of the first machine would result unless it were relieved. When the load is decreased for a predetermined time the second machine is automatically disconnected and stopped. By

FIG. 3—COMPLETE SWITCHBOARD FOR AUTOMATIC SUBSTATION

The equipment for automatic operation rarely occupies much more space than the manually operated equipment. The proper functioning of the station depends on a certain sequence of relay operations.

this means the light load losses of the second machine are eliminated at times when the demand can be satisfactorily met by the first unit alone.

A further economy resulting from the substitution of automatic for manual operation is a reduced maintenance charge due to better handling and protection of the equipment. With automatic control each switching operation is a direct function of the electrical condition existing at that particular moment, and as each succeeding operation is dependent upon the proper functioning of those preceding, the equipment is started and put into service in the smoothest possible manner, and all possibility of damage through incorrect or careless switching is avoided.

Automatic protective devices prevent damage to the equipment from any abnormal condition or source of trouble with the least interruption to service, the substation being locked out of service only in case the presence of an inspector is required. As these devices perform immediately the functions ordinarily left to the observation and judgment of an operator, serious damage often is averted which might otherwise result from failure to act promptly. In addition to reduced maintenance and added life of the equipment, extended periods of time lost in repairing damaged equipment are avoided.

As these advantages of automatic operation became generally recognized the demand in the mining industry soon increased to such an extent as to warrant the standardization of automatic control equipment for motor generator sets and rotary converters of the capacities generally used in mining service. These include machines up to 300 kw., 25 or 60 cycles, 2,300 volts d.c., 275 or 600 volts d.c., this being the largest rating usually desired in a single unit. The design of these standard equipments is based on the extensive experience obtained in the railway field and in the early mining installations.

Thorough consideration has been given to the re-

quirements peculiar to the mining industry, with the result that features not necessary or desirable in a mining substation have been eliminated, and the cost and complication considerably reduced thereby. Simplicity and reliability have been considered of prime importance. The control and protection of these substations is obtained largely through the use of magnetic contactors and relays that have been proved by years of service in industrial and power-control work.

With those who are unfamiliar with automatic substation equipment there is apt to be a feeling that the control is highly complicated and difficult to maintain. This is not the case, however, as the entire operation and the functions of the various devices can be readily understood after a little study and experience. To demonstrate this it is thought advisable to describe in some detail the performance of an automatic synchronous converter substation which was recently put into operation in a Western coal mine. This type of equipment is not quite so simple as that for a motor-generator set, as provision must be made to correct polarity if the converter starts up with reversed d.c. voltage, and in the 300-kw. size the d.c. brushes must be raised at starting.

The complete wiring diagram of this substation is given in Fig. 2, showing all power and control circuits, omitting only the meters, which have no part in the automatic operation. The diagram is arranged to show the various circuits as short and direct as possible, to facilitate tracing out. Operation of the equipment in starting up is outlined by the sequence table. A detailed description of a mine installation is given below.

The automatic switchboard is shown in Fig. 3, the principal control and protective devices being mounted on slate bases assembled on pipe framework. The various devices are numbered to correspond to the diagram and list of apparatus. The high-tension oil circuit breaker with its operating mechanism is mounted on a separate panel—Fig. 4—so that it may be set up in the most convenient location. This equipment controls a 150-kw. 275-volt d.c. synchronous converter supplied from a 2,200-volt 3-phase 60-cycle line, representing practically the latest practice in the automatic operation of a mining substation of this type and rating.

DETAILS OF AUTOMATIC OPERATION

In normal operation of the substation the disconnecting switches and control knife switch shown in the diagram are closed at all times, and the S. P. D. T. knife (17) switch shown at the bottom of the switchboard is closed on the bottom contact corresponding to the right-hand contact in the diagram, which provides for starting and stopping from a remote pushbutton. The station also can be started and stopped independently of the remote pushbutton by the use of the top contact of the S. P. D. T. knife switch (17), when the substation is being inspected. The converter then starts automatically with the proper sequence of operations, according to the following explanation, which can be more readily understood by referring to the diagram:

Operation 1—The coil of the auxiliary master relay (3A) is energized by the starting device, being connected across the 110-volt bus B-C through the over-speed device (24) and the contact 7A of the polarized motor relay (7). Contact 7A is closed only in the neutral or de-energized position of relay (7) so that the relay must be in this position before starting up.

Operation 2—The master control relay (3) is ener-

gized through the contacts of relay (3A). Closing of relay (3) energizes the 440-volt control bus A.

Operation 3—When bus A is energized, the coil of the starting control relay (4) is energized through interlocks on relay (19) and running contactor (11). This prevents closing of the starting control relay (4) unless the running contactor (11) is open.

Operation 4—Through one contact of relay (4) the coil of the starting contactor (6) is energized. The other contact of relay (4) energizes the high-tension oil circuit breaker control relay (22).

Operation 5—Closing of the starting contactor (6) connects the collector rings of the converter to low-voltage starting taps of the power transformers. Closing of relay (22) energizes the closing coil of the high-tension oil circuit breaker (20) across the 440-volt control bus AA-BB. Closing of the oil circuit breaker (20) connects the high-tension side of the transformers to the line, and starts the converter on reduced voltage through starting contactor (6). The starting time-delay relay (26) is energized by an interlock closing with contactor (6). The contacts of relay (26) close after a definite time delay, provided the starting sequence is not completed.

Operation 6—The oil circuit breaker latch (20A) is energized by an interlock which closes with the oil circuit breaker (20). The polarized motor relay armature and clutch (7M and 7C) are energized from the direct-current side of the converter through an interlock on starting contactor (6).

Operation 7—The oil circuit breaker control relay (22) is de-energized by an interlock which opens when the oil circuit breaker latch (20A) closes.

Operation 8—The oil circuit breaker closing coil (20) is de-energized by opening of the control relay (22). The oil circuit breaker is now held closed by latch (20A), which requires only a small amount of power.

Operation 9—With a rotary converter starting in this manner provision must be made to reverse the direction of field excitation momentarily to correct the d.c. polarity if the machine starts up reversed. This is the function of the polarized motor relay (7). The relay consists of a small direct-current armature (7M) placed in the field between poles of a permanent magnet. When the armature (7M) is energized it drives through a gear train and a magnetic clutch (7C) a small drum carrying the moving parts of two sets of control contacts (7B and 7D). The direction of rotation of the relay determines which of these two sets of contacts will close.

Under operation 6 it is noted that the polarized motor relay, armature (7M) and clutch (7C) are energized from the d.c. brushes of the rotary converter. As the machine comes up to synchronous speed the relay armature receives direct current and begins rotating in a definite direction which is dependent on the direction of current flow and accordingly on the polarity of the converter. If the polarity is incorrect when the machine reaches synchronous speed, the direction of rotation of the relay will be such that contacts (7D) are closed.

Operation 10—Closing of polarized motor relay contact (7D) energizes the field reversal control relay (9), which is excited from the direct-current side of the rotary converter.

Operation 11—Closing of relay (9) energizes the coil of the 4-pole double-throw field-reversing contactor (10) through the starting control relay (4). This closes the upper row of contacts, which are normally open, and

reverses the excitation of the converter. With the excitation reversed the rotary converter "slips a pole," and the voltage drops to zero, the shunt field being split in two and the two halves connected in parallel to insure rapid operation on reversing.

Operation 12—When the converter voltage drops to zero the polarized motor relay (7M and 7C) and relay (9), which are excited from the d.c. side, are de-energized and the rotating drum of the polarized motor relay is returned to the neutral position by a spring. Opening of relay (9) de-energizes the field-reversing contactor (10), which is closed and held in its normal position by gravity. The rotary converter having dropped back a pole, its polarity is now correct with normal excitation.

Operation 13—As the d.c. voltage builds up with correct polarity, the polarized motor relay (7M and 7C) is energized in the opposite direction.

Operation 14—Rotation of the polarized motor relay in the opposite direction closes contact 7B after an inherent time interval.

Operation 15—Closing of contact 7B energizes the starting transfer relay (19) from the 440-volt control buses B-A'.

Operation 16—The starting control relay (4) is de-energized by an interlock which opens when starting transfer relay (19) closes.

Operation 17—Opening of the starting control relay (4) de-energizes starting contactor (6).

Operation 18—Polarizing motor relay (7M and 7C) and starting time delay relay (26) are de-energized by interlocks which open with starting contactor (6).

The running control relay (5) is energized through relay (19) and an interlock which closes when starting contactor (6) opens. This prevents closing of the running contactor until the starting contactor has opened.

Operation 19—Closing of running control relay (5) short-circuits a series resistor in the converter field circuit, and also energizes the running contactor (11). This connects the rotary converter collector rings to the full voltage taps of the power transformers. The converter is now running light with full voltage.

Operation 20—Increasing of the converter field excitation to normal value by closing of relay (5) closes the field current relay (38). This relay prevents loading of the rotary converter until its field is excited.

Operation 21—Closing of the field current relay (38) energizes the equalizer contactor (39) through master relay (3), and an interlock closing with running contactor (11). This equalizer contactor is mounted separately and is required only in case the converter is to operate in parallel with another machine.

PUTTING CONVERTER ON THE D. C. LINE

Operation 22—The d.c. line contactor (12) is energized through a normally closed pushbutton, the overload relay contacts (50) and an interlock closing with the equalizer contactor (39). This requires the equalizer contactor (39) to be closed before the d.c. line contactor (12).

An interlock closing with the d.c. line contactor (12) shunts the contact on master control relay (3) which connects buses A and A'. This prevents disconnecting the converter from the a.c. line until the d.c. side is opened.

It will be seen by the preceding explanation that the entire operation of starting is carried through in the correct sequence, and with no more than the proper

amount of delay to allow the machine to come up to speed. All danger of damage to the equipment from faulty or careless switching is removed. The equipment is started and in operation in 10 to 20 seconds after closing of the starting contact, depending on the setting of delay relay (52).

The protective equipment is designed to provide adequate protection from damage by any abnormal operating condition, and at the same time to assure the least possible interruption of service. Reference to the diagram will show the relation of the protective devices to the rest of the apparatus.

In case of trouble which will not be cleared automatically it is necessary to lock the station out of service. For this purpose lockout relay (30) is used. When the lockout relay is energized its contacts short-circuit the coil of the auxiliary master relay (3A), and the station is shut down by the opening of relay (3A). The contacts of the lockout relay (30) on closing are held in this position by a latch, so that the station is prevented from restarting until the latch is reset manually by a maintenance man. The coil of lockout relay (30) is energized by protective devices which operate in case of trouble requiring an inspector's attention.

Alternating-Current Overload—Two induction type overload relays (23) energize from current transformers provide protection from excessive alternating-current overloads. These relays are set to operate only on very abnormal overloads such as would be caused by a short-circuit on the alternating-current side, the d.c. relays protecting against ordinary overloads. Operation of the a.c. overload relays locks out the station by closing relay (30), which opens master control relays (3A) and (3).

Bearing Protection—The rotary converter is equipped with two bearing thermostats (25) which operate relay (30) and lock out the station if the bearing temperature rises to a dangerous point.

Starting Protection—If the starting operation is interrupted and the converter remains connected to the starting taps for a longer period than necessary the station is locked out by the starting time delay relay (26).

Unbalanced Phases—If for any reason the phase currents to the converter become unbalanced the station will be shut down by the phase balance current relay (46), the contact of which short-circuits the coil of the auxiliary master relay (3A). If the condition still exists when an attempt is made to restart, operation of relay (46) will close relay (30), and lock the station out of service until the trouble is located and cleared.

FIG. 4—MAIN LINE OIL SWITCH ON ALTERNATING-CURRENT SUPPLY

At one time the human element seemed necessary and highly desirable for the proper care and operation of converting equipment. Today automatic equipment gives far better results than manually operated equipment. The switch in the photograph functions more positively than any manually operated switch, in that the contacts are completely and positively made whenever the switch is closed.

Reverse Current—Reverse current or inverted operation of the converter is prevented by relay (32), which shuts down the station by short-circuiting the coil of relay (3A).

Overheating—Overheating of the converter from sustained overloads is prevented by the a.c. thermal overload relays (29). This relay is essentially a thermostat having a temperature characteristic similar to that of the converter so that the relay contact closes just before a dangerous temperature is reached. Operation of relay (29) shuts down the station by short-circuiting the coil of relay (3A), and the contact of relay (29) is maintained for a time to allow the converter to cool before starting up again.

Phase Failure—Starting of the station under single phase or reverse phase is prevented by relay (18). The contacts of this relay are closed also by low a.c. voltage.

Overspeed—The converter is prevented from overspeeding by a centrifugal device (24) which disconnects auxiliary master relay (3A).

No Field—Opening of the converter shunt field circuit de-energizes relay (38) and prevents closing of the d.c. line contactor (12).

D.C. AUTOMATIC CIRCUIT BREAKER PROTECTION

Direct-Current Overload—The converter is protected from excessive overloads and short-circuits on the d.c. side by overload relay (50), which causes the line contactor (12) to open. The overload relay is provided with a dash pot so that service is not interrupted by momentary overloads within the capacity of the converter, while rapid operation is obtained on short-circuits. When opened, the contacts of relay (50) are held in that position by a latch.

When the d.c. line contactor (12) opens, the coil of the reset delay relay (52) is energized through an interlock. Closing of the reset delay relay is retarded by an oil dash pot which may be adjusted to the desired value. When relay (52) closes, the resistance of the load between trolley and rail, in series with resistor *RY*, forms one leg of a Wheatstone bridge arrangement, the remainder of which is composed of *RW*, *RX* and *RZ*. The coil of the d.c. line contactor reset relay (51) is used with this grouping in such a manner that its contacts are closed when the resistance between trolley and rail has increased to such a value that the converter will not be overloaded upon closing of the line contactor. Operation of relay (51) energizes the latch release coil (50R) which trips the latch holding open the contacts of overload relay (50). The d.c. line contactor (12) then recloses and the shunt reset relays are de-energized.

By this method the equipment is fully protected from excessive d.c. overloads, and the service is restored almost immediately after the cause of interruption is removed, except when intentionally delayed by relay (52).

The installation described provides all the operating and protective devices necessary for a station of medium size. The standard equipment is sufficiently flexible, however, to permit the addition of other features that may be desired.

As shown by this discussion, the operation and protection of the automatic equipment is much more reliable than that to be expected of manually controlled equipment. As a result of this and its economic advantages, the automatic substation is rapidly gaining favor in the mining industry, and warrants serious consider-

ation for new installations. Existing manually controlled stations can be arranged to obtain the benefits of automatic operations with minor changes in the equipment.

Electrical Engineers in Annual Convention And Technical Sessions

THE American Institute of Electrical Engineers held its thirty-ninth annual convention at Swampscott, Mass., June 25 to 29. Headquarters were at the New Ocean House. Dr. A. E. Kennelly, chairman of the convention committee, made the welcome address on Monday. At the same meeting President Frank B. Jewett delivered an address on "The National Engineering Societies, Their Problems of the Past, Present and Future."

The first technical session was held on Tuesday morning, when papers were read by Messrs. Steinmetz, Hayden, Eddy and Simons, pertaining to cable charge, dielectric strength and capacities of conductors. In the evening demonstrations were given of a 30,000-watt incandescent lamp and of the public address system with telephone lines.

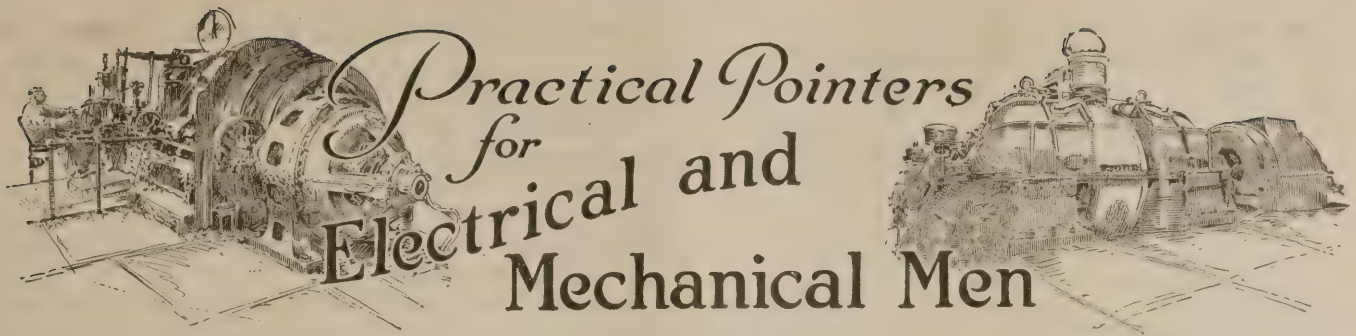

The technical sessions held on Wednesday were descriptive of the Weymouth Power Station, the ultimate capacity of which is to be approximately 300,000 kw. and where considerable research and experimental work is being done with a boiler and turbine designed for operation at a steam pressure of 1,200 lb.

An interesting paper on "Cooling of Electric Machines" also was read. This paper dealt with the ability of copper, iron and insulation to dissipate heat by conduction and showed the results of tests to determine the rate of heat dissipation by natural ventilation, radiation and convection currents. Several interesting papers also were read on plants and equipment used in transoceanic telephony and national broadcasting and receiving. Other papers covered a large variety of subjects relating to transmission of electricity, protection and utilization problems and developments.

Inspection trips to many points of technical and historical interest were arranged. The General Electric Co.'s Lynn works, Simplex Wire & Cable Co. plant, New England Telephone & Telegraph Co. exchange and Watertown Arsenal were most popular.

About 1,200 members and guests were presented, which shows the growing appreciation of the importance of the work of the society in promoting electrical science and its pioneering in electrical application.

SALES OF EXPLOSIVES in the United States in April, 1923, according to the U. S. Bureau of Mines, amounted to 598,622 kegs of black blasting powder, 5,443,735 lb. of permissible explosives, and 23,466,571 lb. of high explosives other than permissible. Each of these figures represents a large increase over April sales during the past four years with the single exception of black powder sales for April, 1920, which amounted to 611,979 kegs. The figures presented are based upon reports from manufacturers whose sales amount to about 90 per cent of the total sales of explosives in the United States. The quantity of black powder sold in April was 1.3 per cent less than the amount sold in March, 1923, but it exceeded by 222 per cent the sales for April, 1922, when coal mining, the principal consuming industry for black powder, was so greatly affected by the miners' suspension of work. April sales of permissibles were 20 per cent more than in March, 1923; 228 per cent more than in April last year, 125 per cent more than in April two years ago, and 48 per cent more than in April 1920.

Electrolysis from Current Leaks

WE ARE experiencing considerable difficulty in one of our mines due to electrolytic action on some of our important cable systems and also on pipe systems. I would like to have some suggestions as to how some of this leakage may be eliminated and the damage resulting at present reduced.

MINE ELECTRICIAN,
Pennsylvania.

The greatest cause of electrolysis in coal mines is insufficient bonding of track joints. Usually this would mean that a larger number of bonds is needed but it also means proper installation of bonds and the correct type of work.

Poorly bonded joints may cause the current to leave the track and flow toward the power house or substation through a gas or water pipe or the metal sheath of an electric cable. This leakage current may cause electrolysis at the joints of the pipe and in time destroy the joints.

Because of its location or surroundings this pipe or sheath may become electro-positive to some other pipe or the track, and in leaving the pipe or sheath the current sets up an electrolytic action which is destructive to the spot where it leaves. The result of electrolysis is readily recognized but it is difficult and sometimes impossible to locate it is its incipient stage.

Whenever a pipe or the ground in the vicinity of a negative return rail is electro-positive to that rail (measured with a low reading voltmeter) it is fair to assume that all the current is not returning on the rail and that an electrolytic action is in progress. The destructive action is a direct function of time but is not always proportional to the magnitude of the leakage current and a small current density may cause very serious corrosion.

There are three remedies for electrolysis. First, by permitting the leakage to continue but by bonding the pipe joints and connecting the pipe electrically to the return lead of the generator, the current remains on the pipe and cannot start destructive electrolytic action. Second, by installing insulated joints in the pipe the current can not flow over it but must flow through the ground. Third, by electrically bonding the pipe joints in certain zones and then bleeding the current from the pipe by return cables the current is returned without destructive action. This is called a mitigating system.

The three schemes are difficult to carry out successfully and being corrective in principle rather than preventive, none of them protects the rail which may be eaten away at the base, due to the current leakage. The best scheme is to prevent current leakage by having efficient bonding and a return track circuit which is the path of least resistance to the generating station.

To obtain this it may be necessary to supplement the rail return with negative cables or negative boosters, but in any case the current should be kept where it belongs.

Block Signal for Mine Track

WE HAVE been able to save considerable time and eliminate many wrecks by using a simple block signal in handling trips on partings. An arrangement such as shown in Fig. 1 was used. One wire was fastened to an insulated section of the parting track and the other fastened to the opposite rail. These wires were connected to the regular binding posts of a 20-volt a.c. bell, from which the gong was removed. A pair of wires from the regular 220-volt lighting circuit with a lamp in the circuit were connected by placing one wire on an insulated piece of iron where the clapper would rest with no current flowing through the electromagnets; the other wire was grounded to the bell frame.

When there are no cars on track A, shown in Fig. 1, the clapper of the bell is pulled away from the electromagnets by the clapper spring, which causes the clapper to come in contact with the insulated piece of iron. Completing the 220-volt circuit through the frame of the bell and causing the light to burn. When cars are on track A the 20-volt circuit is closed by the current passing through the wheels and axles of the cars, causing the electromagnet to become magnetized and thus pulling the clapper away from the piece of insulated iron, breaking the circuit and putting the lamp out. Thus, with the above-described connections the rope runner dropping empties into the parting can tell at a glance if the track is clear which is indicated by the lamp when lighted. If the light was out it would indicate that there were cars on the track and he would have to wait until the light came on.

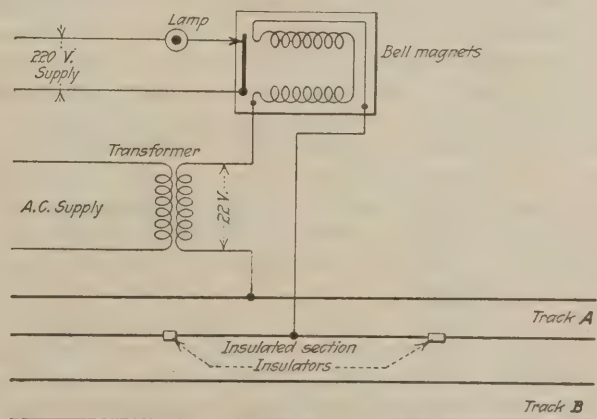

FIG. 1—BLOCK SIGNAL CIRCUIT

Cars standing on the section of track which is insulated completes the 22-volt circuit, which, operating through the bell magnets, opens the local 220-volt circuit, thus putting the lamp out. When there are no cars on the track the control circuit is not operative and consequently the spring on the clapper of the magnet frame closes the local circuit and keeps the lamp lighted.

FIG. 2—OPERATION OF IMPROVED RELAY

A shows the track circuit open and the signal circuit closed, thus lighting the lamp. B shows the track circuit closed and the signal circuit opened, the lamp being out.

A different arrangement can readily be made by changing the insulated piece of iron so that when the cars are on the track the clapper will come in contact with it. With this arrangement the light would burn with the cars on the track and would not burn when the track was empty. The first arrangement has been used because at many places there are times when the power goes off, so that with this arrangement no damage can be done because the absence of a burning light indicates that there are cars on the track. An enlarged sketch of the action of the bell under both conditions is shown in Fig. 2. These are self-explanatory.

In some places the block signal is placed on track B, indicating when the loaded cars are on the track and preventing dropping more cars into the parting until it is clear. There are several possible arrangements for this system which any electrician can readily make to accommodate local conditions. The cost of this installation is very low. The only materials needed are a 20-volt bell (without gong), a stepdown transformer, a lamp socket and lamp with sufficient wire to make connections. The insulated sections in the track are made of wood.

CECIL ROWE,
Mining Engineer.

Tokay, N. M.

Worn Locomotive Tires Removed Through Aid of Engine Lathe

REMOVAL of worn locomotive tires from the wheels by driving in a drift punch, thereby cracking the tire, as an alternative method to that of the acetylene flame is suggested by the New Field By-Product Coal Co., of North Bessemer, Pa. Either method can be recommended as a vast improvement over the altogether too dangerous method of lifting off a tire by dynamite.

The job is done at the mine of the above-named company by lifting a wheel set by a carriage crane and transporting it to an engine lathe, where it is placed on blocks that rest on the lathe bed. A $\frac{3}{4}$ -in. drill is inserted in the headstock and is made to pierce the tire, running at high speed and clearing the wheel, by feeding the work toward the drill through the turning in of the footstock screw. A few blows of a sledge upon a drift punch inserted in the drillhole will crack the tire.

Two men can remove four 18-in tires and shrink on new ones in two hours. While the worn tires are being removed the new ones are being heated so that no time is lost in making the change.

EUROPEAN NATIONS MAY BURY the hatchet, but they seem to retain plenty of axes to grind.—*Brooklyn Eagle*.

Track Block Prevents Runaway Mine Cars

IN AN endeavor to provide safe working conditions in its Springdale mine the Allegheny-Pittsburgh Coal Co., Pittsburgh, Pa., has placed a safety block in every working place whether it be a room or a heading. As the illustration and the sketch show, it is nothing more than a trapezoidal block of oak which is pinned to a clevis inserted under the rail so as to embrace the rail.

Primarily it is used to prevent a mine car from leaving the track near the face of a room or heading. Though it is termed a safety block, it might better be called a track block in that its sole function is to block the track. Consequently, it might be considered an idea borrowed from the railroad where concrete or wooden piers are used for this purpose.

Mine cars pushed in a room are seldom spotted near the face by a mule driver or motorman. For this

SAFETY BLOCK HOLDING CAR

Blocking the car in this manner makes mining work safer. Runaway cars always are a source of danger and frequently hold up the whole transportation system.

reason the miner is required to push the mine car within shoveling distance of the face. The result is that he must move the mine car and look to the braking simultaneously. Sometimes the mine car gets away from him, passing over the end of the track onto the bottom. If the working place is on the dip, this danger is most likely to occur. Frequently considerable time is lost in putting the mine car back on the track. A spotted mine car with brakes improperly set might run toward the face when on the dip, or away from the face when on the rise, endangering the life of the miner at the face in the first instance and the lives of those behind this miner in the latter case.

These dangers are removed by fastening the safety block onto the ball of the rail on the grade end of the spotted car. Similarly,

a block is placed to hold the truck of a shortwall mining machine. Where rooms are on the dip, a block located about 60 ft. from the face will derail a runaway mine car which might be placed carelessly behind a cutting crew at the face.

A. F. BROSKY,
Pittsburgh, Pa.

DESIGN OF WOODEN STOP

The shape of the block is such that it performs its function with the car on either side. There are no lefts and rights in this design.

ACCORDING TO THE RAILROADS, what is needed for their going ahead is more backing up.—*Norfolk Virginian-Pilot*.

41,000,000 Tons of Bituminous Coal Stocked June 1, Largest Reserve Since March, 1922

Commercial consumers had in storage on June 1, 1923, approximately 41,000,000 tons of soft coal. This was an increase over stocks on March 1, 1923, of 5,000,000 tons, and is the highest level recorded since March, 1922, according to a report just issued by the Bureau of the Census, the Geological Survey, and the Federal Fuel Distributor. Strictly comparable records for corresponding dates are not available except for June 1, 1920, when stocks were at the lowest point on record. The supply on June 1, 1923, was more than twice as large as that three years before. The available data indicate that the tonnage on hand on June 1 probably was about the same as on June 1, 1921.

Measured in tons, stocks increased 13.9 per cent between March 1 and June 1. Measured in terms of days' supply, the increase was 36.4 per cent. The larger increase in days' supply is explained by the fact that the rate of consumption decreased perceptibly between March 1 and May 31. At the rate of consumption during that period stocks on June 1 were sufficient to last 30 days on the average. Such an average is based on the assumption that stocks were evenly divided. This is never the case, however, and it must be borne in mind that figures far above and far below the average are used in this report. In every locality there are consumers who store practically no coal, and others who usually have on hand a great deal more than the average tonnage.

FIG. 1—TOTAL COMMERCIAL STOCKS OF BITUMINOUS COAL, OCT. 1, 1916, TO JUNE 1, 1923

Figures represent million net tons and include coal in the hands of railroads, industrial consumers, public utilities and retail dealers. Coal for steamship fuel, on lake docks, in transit and that in bins of householders is not included. The figures for 1923 are subject to revision.

Stocks on the Lake docks at Duluth-Superior and Ashland-Washburn on June 1, 1923, were 1,591,000 net tons. Complete records for the Lake Michigan docks are not available. A group of producers who store coal at the mines or at some intermediate point had 960,000 tons in storage on June 1.

Retail dealers in anthracite received more of that coal than they delivered in the three months preceding June 1, and their stocks on that date were 130 per cent larger than on March 1. The stocks on anthracite on the Lake docks at Duluth-Superior and Ashland-Washburn totaled 86,263 net tons. No data are available on stocks on Lake Michigan docks.

The total quantity of soft coal in the hands of commercial consumers on June 1, 1923, was between 39,000,000 and 43,000,000 net tons—probably 41,000,000 tons. This estimate does not take into consideration coal in the cellars of householders, concerning which no statistics are available, nor steamship fuel, nor coal on the Lake docks, which items are classed as coal in transit.

The accumulation of reserve stocks which had been in

progress since the fall of 1922, and which had been temporarily halted in February, was resumed sometime after March 1. This increase was made possible partly through a perceptible decrease in consumption. The rate of consumption from March 1 to May 31 is estimated at approximately 1,500,000 tons per day. When compared with the rate in February, this was a decrease of 200,000 tons per day.

The average stocks for all consumers on June 1 were sufficient to last 30 days at the rate of consumption in March, April and May. At the rate of consumption in February, the stocks on March 1 would have lasted 22 days. The low record stocks on June 1, 1920, were sufficient for but 15 days at the current rate of consumption at that time.

Taking the country as a whole, the stocks held by general industrials were sufficient to last 39 days. This was an increase of 5 days over the supply on March 1. In comparison with dates on which stocks were large, the supply on June 1, 1923, was sufficient for 17 days less time than that on March 1, 1922, and 26 days' less than on Jan. 1, 1919. Information is not available for the corresponding date in 1921 but it seems evident that the tonnage on hand is larger than on that date even though the days' supply is smaller. This is explained by the greater rate of consumption at present.

Electric-utility plants' stocks on June 1 were sufficient for 45 days, against 34 days' supply on March 1. On June 1, 1920, such plants had enough coal to last but 22 days. Stocks at coal gas plants increased from a 58-days' supply on March 1 to 75 days' on June 1. This was nearly three and a half times the supply on June 1, 1920.

Practically complete returns from byproduct coke and steel plants indicated the following reserves on June 1 and March 1, 1923, which show no great change during the period from March 1 to June 1, 1923:

	BYPRODUCT PLANTS			STEEL WORKS	
	(Days' Supply— June 1, 1923	March 1, 1923		(Days' Supply— June 1, 1923	March 1, 1923
Low volatile...	21	17	Steam coal....	27	23
High volatile..	24	19	Gas coal	31	30
Average	23	19	Average	29	26

The total quantity held by the railroads in stockpiles, cars and chutes on June 1 was 8,500,000 tons, a supply sufficient for 21 days. In comparison with March 1 this was an increase in days' supply of approximately 31 per cent.

FIG. 2—DAYS' SUPPLY HELD BY DIFFERENT CLASSES OF CONSUMERS ON JUNE 1, 1923, AND MARCH 1, 1923

At the rate soft coal was burned from March 1 to May 31, 1923, the stocks on June 1 were sufficient to last 30 days. The stocks on March 1 were sufficient to last 22 days at the rate of consumption in February. Two factors in the increase in the reserve on June 1 were a normal seasonal decline in some industries and curtailment of operations in others. The supply on June 1, 1923, was sufficient for 15 days more time than that on June 1, 1920, when stocks were at the lowest point on record.

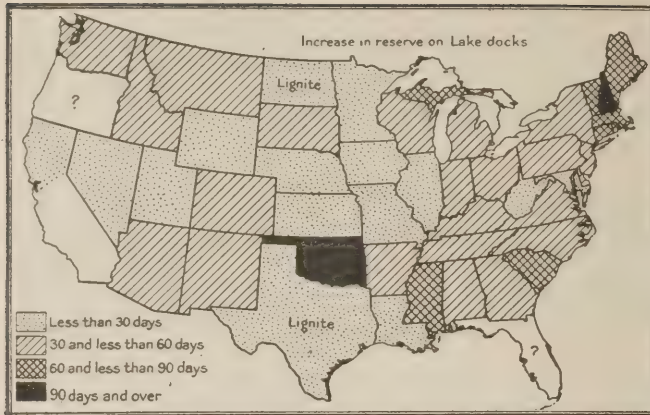

FIG. 3—DAYS' SUPPLY OF SOFT COAL ON HAND AT INDUSTRIAL PLANTS ON JUNE 1, 1923

At the average rate of consumption that prevailed from March 1 to May 31, 1923, reserve stocks at industrial plants other than steel and byproduct coke would last on the average 39 days. The map shows how the supply varied from state to state. Changes in business activity which affect coal consumption are quickly reflected in the days' supply. Decreased consumption after March 1 increased the days' supply on that date, based on February consumption, from 34 to 37 days. Based on reports from 2,194 plants.

Deliveries of bituminous coal by retail dealers decreased sharply after March 1, the average daily rate during March, April and May being but little more than half that in February. On June 1, 1923, retailers had a supply sufficient to last 27 days at the rate of delivery during the three months preceding, against 11 days' supply on March 1. The days' supply on June 1, 1923, was practically the same as on April 1, 1921. The unusual demand for bituminous coal for household use in the territory which ordinarily burns anthracite continued during most of March, but ceased with arrival of warm weather.

The quantity of unbilled coal in cars standing at the mines increased from 183,000 tons on March 1 to 421,000 tons on June 1. The tonnage at junction points and terminals awaiting reconsignment decreased from 43,000 to 36,000 tons.

Stocks of byproduct coke increased 132 per cent during the period March 1-May 31, and the quantity on hand June 1 was 202,000 tons. In spite of this large increase the supply on June 1 was less than one-fourth that on March 1, 1922, when the reserve was heaviest.

Unseasonably cold weather during March and April maintained the demand for anthracite at a high level, and retailers were given but little opportunity to accumulate reserve supplies during that time. On June 1, 1923, stocks in the hands of 413 retail dealers totaled 668,491 net tons, against 290,852 tons on March 1, 1923. This was an increase of 130 per cent. Retailers' stocks on June 1, 1923,

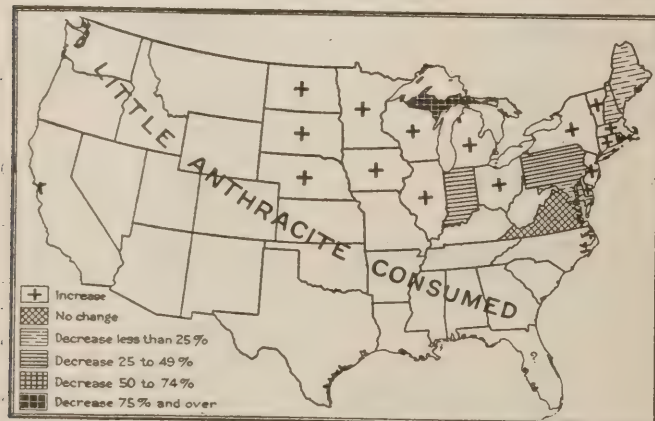

FIG. 4—HOW RETAILERS' STOCKS OF ANTHRACITE ON JUNE 1, 1923, COMPARED WITH THOSE ON JUNE 1, 1920

Stocks of anthracite in retail yards were 133 per cent larger on June 1 than on March 1, 1923. The supply was sufficient to last on the average 19 days at the rate of delivery from March 1 to May 31. The map shows how stocks on June 1 compared with those on June 1, 1920. In all but 7 of the anthracite consuming states the supply on June 1, 1923, was considerably larger than it was 3 years ago.

were 40 per cent less than on March 1, 1922, 44 per cent less than on April 1, 1921, and 22 per cent more than on June 1, 1920. Measured in terms of days' supply, retailers' stocks of anthracite on June 1, 1923, were sufficient to last 19 days at the average rate of delivery from March 1, 1923, against a 10 days' supply on March 1, 1923, at the rate of delivery in February.

Available information indicates the probability that producers have little, if any, domestic sizes of anthracite on hand.

Rail Brotherhood Agrees to Unionize Mine

The miners' union appears to have browbeaten the Brotherhood of Locomotive Engineers. In a conference at Chicago last week it was decided to permit the unionization of the Lick Creek mine in Boone County, West Virginia, which has been operated on an open-shop basis by the Brotherhood. Warren S. Stone, for the Brotherhood, general manager of the Coal River Collieries, as well as the United Mine Workers conferees and J. C. Lewis, president of the Iowa Federation of Labor, who acted as arbitrator, declined, after the meeting, to make public the exact nature of the agreement. Mr. Stone did say, however, that "no objection would be advanced" to the miners in the Brotherhood property unionizing. The mine several weeks ago was declared by the miners' organization to be in a state of strike though most of the men working in it did not belong to the union.

Miners Buy Herrin Massacre Strip Mine

The strip mine near Herrin, Ill., around which centered the Herrin massacre of June 21, 1922, has been bought by the United Mine Workers. The sale was made by way of satisfying damage claims against the union filed by the original owners or their representatives following destruction of the equipment at the property following the mine siege. It is reported the price was \$250,000, but this and other details have not been made public. No announcements have been made about the future operation of the mine.

Indiana Tries for Loading-Machine Scale

The joint conference of Indiana operators and union officials to discuss fixing a scale of pay for operators of underground loading machines in that state has begun its sessions but has not yet accomplished anything. The conferences started in Terre Haute, Ind., without much hope for a definite agreement soon but with a prospect of clearing the ground and of approaching a working basis for negotiation. The three operator conferees are Phil Penna, J. B. Pauley and Paul Zimmerman. For several months loading machines have been working in three mines. Machine operators have received \$12 a day, but the theory is that development work is their main activity. Mine owners consider it hopeful that the union is now ready even to discuss the question of fixing a scale for room loading.

Illinois Operators' Associations May Unify in Relations with Labor

The three operators' associations of Illinois scheduled a joint meeting in Chicago for Wednesday, July 11, to consider several matters, including the proposal to unify in their relations with labor. It is possible a single board to represent the entire state will be set up to supplant the three boards which now meet the miners in joint conference over disputes arising under the labor contract. Also there is much conversation over a proposal to employ a single labor commissioner for the state, though nobody has yet been able to suggest a man who could be had for the job who would be acceptable to the various operator groups. Also at the meeting the men who attended part of the National Coal Association convention in Atlantic City will report their observations. A strong effort is being made to induce the Illinois operators to rejoin the National.

I. C. C. Declares Ohio Coal Rates Too High; Readjustment Ordered Sept. 27

On July 3 the Interstate Commerce Commission handed down its findings on the Ohio-West Virginia rate case, virtually giving the decision to Ohio. The carriers are directed to readjust differentials to Michigan points between Ohio mines and those in the so-called crescent group of West Virginia, increasing the spread from 40c. to 50c. per ton in the inner crescent and from 60c. to 75c. in the outer crescent. The decrease does not apply to Lake cargo coal.

The rates from Ohio mines to affected territory are to be reduced 10c. and from the outer crescent to be increased 5c., the inner crescent rates to remain unchanged.

The commission made its decision effective Sept. 27 in an order for the readjustment of both sets of rates, reducing those from Ohio and increasing those from the Southern districts.

Commissioners McChord, Potter, Cox and Campbell handed down separate opinions, concurring in the general conclusions of the majority report submitted by Commissioner Esch, but challenging it on the ground that the majority does not go far enough in the one matter of differentials in the rates from the inner and outer crescents over those from southern Ohio.

Southern Ohio, in the opinion of Commissioner McChord, is as fully entitled to the advantage of her geographic position now as when the 40c. differential was fixed with relation to the rate of \$1 from southern Ohio.

"That territory's rate advantage," said Mr. McChord, "expressed in terms of the percentage relationships, is less favorable now than when the differential relationship was fixed. I am convinced that at this time the rates from the crescents should be 60 to 90c. respectively, higher than from southern Ohio. So adjusted, taking the key rate to Toledo with the appropriate reduction from southern Ohio for the purpose, the relationships would then be for southern Ohio 100 per cent, inner crescent approximately 133 per cent, and outer crescent approximately 150 per cent."

The dissenting opinion of Commissioner Potter is particularly striking. His conclusions approximately concur with those of Commissioner McChord but Mr. Potter insists that the rate-making theory should be so modified as not to encourage unnatural long-haul development and operation but to promote the short hauling of coal.

"There is an opportunity," said Commissioner Potter, "through the medium of the rate structure to reduce the average haul, increase efficiency in the use of carrier equipment, reduce carrier costs, bring about available surplus of transportation facilities without increase of carrier investment, concentrate mining labor so as to permit continuous operation, provide steady employment of labor on a basis better for labor, producer and consumer, accomplish an available market surplus of coal and reduce mining costs and coal prices.

"It is quite possible that by this means there could be a direct saving of from \$500,000,000 to \$750,000,000 a year in the price of coal to the consumer, with much additional indirect saving through lower rates and reduced manufacturing costs.

"It is gratifying to know that certain prominent carriers are appreciating that endeavor should be made to eliminate long hauls in the coal traffic. These considerations tend to justify increasing the differential in this case to an extent that, at least, will restore the original normal relation."

Commissioner Potter contends that the Interstate Commerce Commission made a mistake when, some time ago, it allowed an increase out of line with the increase from the crescents to the extent of 30c. a ton on coal.

"The increase in the spread between rates from Ohio mines and those remote," declared Commissioner Potter, "incident to correcting the differential relation, will encourage resort to short hauls in supplying consumers' demands and make for cross-haul elimination and more efficient use of transportation.

"Long hauls make for congestion, high costs and inefficient service and are giving too serious import to the transportation problem. Correct adjustment should enable com-

munities to be less interdependent and more nearly self-sustaining. Artificial adjustments should be modified where consistent with regard for interests entitled to preservation. Change of the differential, as proposed, would be helpful to these ends."

In the opinion of Commissioner Potter the general bituminous coal situation has an aspect which should have influenced the Interstate Commerce Commission in this case.

Lewis Orders Nova Scotia Strikers Back; Livingstone "Scorns" Command

Charging that the strike of 9,000 coal miners in Nova Scotia is "unquestionably a violation of the existing agreement between District 26 and the coal companies" and a violation of the principles and policies of the United Mine Workers, John L. Lewis on July 7 instructed Daniel Livingstone, president of District 26, to take immediate steps to put the men back to work. Miners are on strike as a protest against the calling of Nova Scotia militia in a dispute between neighboring steel workers and their employers.

Dan Livingstone is reported to have "scorned" the telegraphed command of Lewis that the strikers be ordered back to work. "District 26 is absolutely autonomous," was his reported comment on the order, "and it isn't accepting dictation from John L. Lewis or anybody else."

MacLachlan's opinion of the telegram was that "It constitutes thunder, but there is no lightning back of it."

The crown intimated in court July 9 that new criminal laws adopted after the general strike in Winnipeg in 1919 might be brought to bear against Dan Livingstone and James D. MacLachlan, district leaders of the United Mine Workers, charged with circulating false tales. It is alleged that in asserting the police and soldiery had been guilty of brutality, the defendants published "a seditious libel concerning His Majesty's Government of and for the Province of Nova Scotia, and the provincial police."

Miners in the Westville, Thordun and Stellarton sections of district 26 voted Monday night for a 100 per cent strike in support of their demand for liberation of Livingstone and MacLachlan.

ATLANTIC CITY, N. J., July 9—According to a press dispatch John L. Lewis today received a telegram from Daniel Livingstone stating that he had called a meeting of the executive board of the union tomorrow to act upon Lewis' instructions to end the coal strike there. Lewis today wired Alexander McIntyre, vice-president of the district, to carry out the instructions contained in the telegram to Livingstone, who is in jail.

48,824,127 Tons of Anthracite Produced In 1922, Valued at \$273,700,125

Production of Pennsylvania anthracite in 1922, according to statistics released by the Geological Survey on July 7, was 48,824,127 gross tons, with a total value of \$273,700,125. The value given, it is stated, is the value at which the coal left possession of the producing companies f.o.b. the mines, and does not include the margin of separately incorporated selling companies.

The total quantity of fresh-mined coal was 45,073,602 gross tons, valued at \$262,798,641; of washery product, 2,943,286 gross tons, valued at \$9,911,775; and of dredge product 807,239 gross tons, valued at \$989,709.

Commercial shipments were 41,073,838 tons, local sales 2,123,393 tons and the quantity used for power and heat at the mines was 5,626,896 tons.

The Wyoming region contributed 25,802,944 gross tons, valued at \$155,261,102; the Schuylkill region followed with 16,056,992 tons, valued at \$79,910,415; of the total the Lehigh region supplied 6,716,137 tons, valued at \$37,327,244, and Sullivan County produced 248,054 tons, valued at \$1,201,364.

Editorial Comment in Eastern Press Approves Anthracite Report

Commentators Impressed with Public Interest in Coal
Mining and Declared Necessity for Publicity
for Costs, Prices and Profits

Two things in the Coal Commission report on anthracite appear above all others to have caught the eye of editorial writers on the New York and Philadelphia dailies, whose comment is on hand as this issue of *Coal Age* goes to press. The first has to do with the public interest in coal mining and the second with the necessity of publicity for costs, prices and profits. The New York *Evening Post* finds that, superficially at least, the most dramatic feature of the report is that providing "power for the President to declare a state of emergency in the event of a cessation of anthracite mining and to take over the operation of the industry." The *Post* thinks that actually this recommendation would "only give formal sanction to a power accepted as inherent in the President." In this connection the New York *Times* notes that "this power has been claimed for the President as inherent in his office, but legislation by Congress is to be preferred to an interpretation of the Constitution that may be opposed and challenged."

PRIVATE MONOPOLY OF KEY INDUSTRY INTOLERABLE

Citing the strike of 1902 and again that of 1922, the *Tribune* concludes that "arbitrary and private control of a monopolized key industry is intolerable. Mr. Lewis and the operators proved this last year. They ought not to have an opportunity to prove it again. The recommendation of presidential intervention goes to the heart of the hard-coal problem so far as the interruption of supply is concerned." The *Evening Star* of Washington thinks that recommendations of the Commission "will appeal to the ultimate consumer as a drop of cool water to a wanderer in the desert." The Philadelphia *Record* finds that "a business that is so thoroughly monopolized as this, and where consumers are threatened with freezing when the railway monopoly and the labor monopoly are dickering for terms, is evidently one that cannot be left to itself." The Philadelphia *Inquirer* hopes "that such an emergency will never arise," as it will cause the President to declare "that a national emergency exists and to take over and operate the mines and determine the proper wages and prices."

ADDS COAL TO CATEGORY OF PUBLIC UTILITIES

Under the caption "Coal a Public Utility" *The Sun* and *the Globe*, of New York, notes that the Commission's "entire work is colored by one idea, expressed clearly, that as with railroads and banks so with coal. The Commission, in other words, adds coal to the list of public utilities." This, that paper thinks, to most Americans will now seem a simple and natural act. The *Inquirer* says that the "Commissioners are here treading on safe ground, for they distinctly repudiate government ownership." The Philadelphia *Public Ledger* is glad that the industry is to lose its shadow of mystery and sees the "outlines of an Interstate Coal Commission" looming large in the report, while the *Evening Post* notes that for the moment we are "not to go as far as the actual fixing of prices." That paper believes that if publicity of the kind recommended by the Commission should not prove an effective remedy against price boosting, it is then "inherent in the Commission's report that the second step should be taken," which step, involving price fixing, "is something which neither the operators nor employees will hasten to bring upon themselves."

The New York *World* believes that "the case for publicity is even more complete than that for regulation. With publicity, the public can take care of itself. When consumers know what profits are realized and what combinations of railroads and mining companies are reaping excess rewards, they will soon insist on regulatory measures where they are most needed."

"The Coal Commission is speaking under great restraint

when it describes the anthracite business 'as a limited natural monopoly,'" notes the Philadelphia *Record*, which adds that there is, furthermore, "a monopoly in the supply of labor." The anthracite business, according to the Brooklyn *Daily Eagle*, "has been run on the principle of a Coney Island concession," with the landowners, operators, miners, railroads, wholesalers and retailers "scrambling for all the profits the traffic will bear." Continuing, the *Eagle* says, "most of these facts were known before, but the Coal Commission has gone a little deeper than any other previous inquiry."

It seems to be quite generally the opinion of the press that, as stated by the Boston *Daily Globe*, "public opinion will give full approval" to the main recommendations of the Commission, and the Washington *Star* believes that "the temper of Congress would scarcely be uncertain when it comes to dealing with the coal situation." If Congress balks, the Brooklyn *Eagle* would find this "a confession of its utter incapacity to deal with an urgent problem." New England, according to the Boston *Post*, is going to be "especially concerned with the recommendations that the President may seize and operate the mines in the event of a tie up."

There is quite general approval of the Commission's stand against nationalization and government ownership or operation. The New York *Evening Mail* notes that the report "wisely does not go so far as those who recommend government ownership of the mines." The New York *Journal of Commerce* believes that "it would not be well to attempt final judgment" upon this report of the Coal Commission until the full text of the document has been scrutinized or until the bituminous coal report is available. But there are nevertheless "a few facts which should be brought most forcibly to the attention of the public." Among others this paper cites the fact that "on the side of labor absolutely no competition remains" and that "nothing is to be gained and much lost by nationalization of the mines."

Not so much interest as might have been expected was displayed in the matter of prices. The New York *Tribune* picks up the fact that "profits have increased nearly 300 per cent" in ten years and that "coal prices are far out of line with the average of increases in commodity prices since 1913," which is a fallacy shared by a number of editorial writers and one on which the Commission report itself is by no means as clear as it should be. The *Evening Post* quite fairly states: "Let it be said at the beginning that the Commission's figures do not bear out the wild charges of profiteering so regularly flung out in heat of controversy." This paper notes that the increases in retail coal prices in New York "range very close to the general index of cost increases since the war," which prices, continues the *Post*, "might, however, be lower by a perceptible degree—and the perceptible degrees count for the average consumer."

WANTS FAT AND LEAN MINES GROUPED FOR AVERAGE

The New York *Herald* strikes the only discordant note in the editorials reviewed on this page. "The report of the U. S. Coal Commission on the anthracite situation is weak because of its failure to deal directly with the underlying problem of the coal industry. As far as the Commission was willing to go, its work is useful, but it was too cautious." The *Herald* points out that the purchaser of coal is interested chiefly in price and in quality and its criticism of the Commission's report is that merging of the operating companies was not recommended as a means to further stabilize price and quality. The *Herald* is opposed to government ownership but it does want the "fat and lean mines" grouped so that the cost of production should be averaged. Although the Commission has been "too timid in dealing with the fundamentals of the industry" the *Herald* conceives that its "methods of careful, scientific inquiry have been admirable and in the final report ought to lead to conclusions of general advantage to the country." The New York *Times* believes that "in the light of this strong report the operators and miners will have no excuse for bickering over wage terms and conditions of labor nor will Congress be sustained by the people if it fails to enact regulatory laws."

Anthracite Wage Conference Shatters Precedents; Two of Eleven Demands Granted

Precedents in a number of important aspects have been shattered at the Atlantic City conference between the United Mine Workers and the anthracite operators. The public and the press have been admitted to the general sessions. A miner instead of an operator is chairman, for on motion of Mr. Warriner, John L. Lewis was selected for that position. And then on July 9, four days after the conference began, the operators granted off-hand, without any attempt at trading, two of the eleven demands of the miners.

Never before has a wage conference in the coal industry begun its work better fortified with the facts of its industry. On Saturday night, July 7, both sides were in possession of mimeograph copies of the anthracite report of the President's Coal Commission and in addition volumes of detailed statistics of earnings of practically all the men in the industry.

At the first meeting on July 6 at the Hotel Ambassador in Atlantic City, John L. Lewis and, in turn, Golden, Kennedy and Brennan, three district presidents of the anthracite mine workers, presented in full the eleven demands framed by the Tri-District convention of the union in Scranton the previous week. Their presentation, together with their arguments, occupied the entire first day and was so voluminous that the official reporters were not able to transcribe the speeches until late on Saturday. For this reason there was no session on Saturday or Sunday in order to give the operators opportunity to study the arguments of the union men and prepare their reply.

WARRINER WAIVES TWELVE-HOUR DAY

On Monday S. D. Warriner, president of Lehigh Coal & Navigation Co., chairman of the Policies Committee of the anthracite operators and spokesman for the committee of twenty-five operators, made his reply to the demands of the mine workers. He conceded two of the demands, that for abolition of the twelve-hour day and the requirement that the umpire of the Anthracite Board of Conciliation render decision within thirty days. With reference to the abolition of the twelve-hour day he said:

"We are entirely conscious that the idea that a man should be required to work a twelve-hour day is not deemed compatible with what we call our 'American standards.' We feel elimination of this practice is dear to your hearts and that public feeling considers it out of date. In the coming sessions of the sub-committee we are ready to work out with you a plan of reorganization satisfactory to both sides by which this practice may be eliminated."

Increases in wages, however, Mr. Warriner deemed unjustified. He said he had looked in vain in the coal commission's report to find any refutation of his belief that present wages in the anthracite mines were adequate to meet present conditions.

"While wages in our fields are wages of which we can mutually be proud," Mr. Warriner said, "we don't mean at all that our ideas are fixed. We are open to conviction and argument, but we can't refrain from giving you the benefit of our business training in the handling of this industry."

Mr. Warriner asked the conference to adopt a resolution pledging that, "To allay public apprehension, we announce that if the completion of negotiations should be delayed beyond Sept. 1, the mines shall nevertheless be continuously operated." He cited "a recent letter from the President of the United States to the U. S. Coal Commission, and another letter from the commission to the operators admonishing us in no uncertain terms that the public must be protected from another stoppage."

The resolution was defeated following a rejoinder by John L. Lewis, the miners' leader and chairman of the conference, in which he said that delaying completion of the negotiations until after Sept. 1, when the present contract expires, could only serve to increase public apprehension and cause a

"runaway market," with higher prices for anthracite. The miners, Mr. Lewis said, joined with the operators "in the desire for a prompt adjudication of the issues before us."

"We are here to relieve the public mind and to get a contract," said Mr. Golden. "We have ample time, if we apply ourselves to the work of negotiating a contract, to reach an agreement that will assure the public not only of a supply of coal but of the price it will have to pay."

Mr. Warriner served notice that he would bring the matter up again in sub-committee.

Continuing, Mr. Warriner said: "I would emphasize our desire to co-operate with you in a full study of those labor conditions that may have developed into controversy and running sores, to the end that we may have harmony and cordiality as well as peace in our industry. We pledge ourselves to do that."

The anthracite industry was not a "limited monopoly" as the coal commission had defined it, he said, because of the competition of producers of hard-coal substitutes, such as bituminous coal, gas and fuel oil.

Nevertheless, Mr. Warriner indicated, this was not necessarily the last word in scale negotiation.

Mr. Kennedy presented a resolution asking that the conference demand an investigation of printed statements made by George Cushing, declaring that Attorney General Daugherty caused the rewriting of part of the coal commission's report dealing with labor-policy recommendations for the anthracite fields.

"In view of the publicity given these astounding charges," read the resolution, "the true facts must be ascertained if the distinguished members of the U. S. Coal Commission are to retain the confidence and respect of the American people. Mr. Cushing should be required by competent authority either to substantiate his most serious charges or make public disavowal and retraction thereof."

On presentation of the resolution the operators could not concur in it, "as we believe it an impugnment of the commission and its individual members."

Mr. Lewis denied there was any such motive in the resolution, but insisted that "steps be taken to have the veracity of the statements set forth, so we may fully understand their nature."

When the question was put all the miners voted "aye" and the operators "no," and as is customary in such cases the motion was declared lost.

John Hays Hammond, chairman of the coal commission, according to the *New York Herald*, bitterly attacked the allegations of George Cushing, saying: "The subject has never been discussed with Attorney General Daugherty, nor has he seen the draft of the report. Furthermore, neither the President nor the Attorney General has made a single suggestion as to the recommendations to be made by the commission. Every recommendation in the report received the unanimous approval of the commission."

Dr. Charles P. Neill declared that the statements made by Cushing were "absolutely false," and Thomas R. Marshall said the Cushing allegations were without foundation and "too ridiculous" to be dignified with formal denial, according to the *New York Times*.

Negotiations will be carried on this week by a sub-committee of eight, four—John L. Lewis and the three district presidents—representing the miners, and four operators.

Extra copies of the full text of the U. S. Coal Commission's report on the anthracite industry, contained in this issue of Coal Age, may be had at cost upon addressing the New York office of Coal Age.

Production and the Market

Weekly Review

With stocks of bituminous coal in the hands of commercial consumers now in excess of 42,000,000 tons, as is indicated by the government's stock report showing 41,000,000 tons on June 1, and with production holding up to 10,500,000 tons per week, there is no occasion for surprise that prices of soft coal are continuing their downward movement. The government figures indicate that the rate of consumption of soft coal is now approximately 9,500,000 tons per week, that 500,000 tons is being exported each week, mainly to Canada, and that approximately 500,000 tons is going into storage out of the current production of 10,500,000 tons.

Prices of bituminous coal continue their decline, *Coal Age* Index of mine prices recording a drop of 6 points to 197 on July 9. The average spot price is now \$2.38, a drop of 8c. in one week and of 35c. in the past nine weeks.

The Federal Fuel Distributor in Washington has just issued a lengthy statement reviewing conditions in all soft-coal producing fields, pointing out the transportation and labor supply are ample and current prices at or below production cost. He also issued a statement to the press urging consumers to buy and store more coal this summer if they would avoid transportation tie-up and higher prices next fall and winter.

With the present rate of production maintained during July and August the country is certain to go into the fall and winter season with a plentiful supply of coal where it is most needed when the railroads are called upon to divert their motive power and facilities to the transportation of grain and other fall products. With between 45,000,000 and 50,000,000 tons of bituminous coal in the hands of commercial consumers and with the docks in the Northwest stocked with coal by the end of summer nothing short of calamity can bring about a sellers' market this winter.

The strike of the Nova Scotia miners brought in several Canadian inquiries and a few sales of high-volatile coal. Inquiries also were received from Euro-

pean and South American houses. During June total dumpings for export at Baltimore were 326,745 tons.

The Coal Commission's report on anthracite reached the operators and miners in conference at Atlantic City last Saturday evening. Both sides found in the first reading points to which they take marked exception, the operators because the Commission recommends that the President be given power to take over the mines in national emergencies and the miners because the Commission would compel them to arbitrate their disputes and would prevent their striking. The public is yet to be heard from.

Although every day that the negotiations are on at Atlantic City the prospects of a suspension of hard

coal mining on Sept. 1 recede farther into the distance, the price of independent coal has taken another upward turn.

Dumpings at Hampton Roads for all accounts during the week ended June 30 were 355,961 net tons, as compared with 333,870 tons the previous week.

Chicago Market Still Lifeless

Had it not been for a little interest in smokeless created by an effort to sink the price of mine run there would have been nothing to enliven the Chicago coal market during the week. One important shipper dropped the price from a low of \$3.75 to a new low of \$3.25 and claimed to draw business

in spite of the fact that nobody wants smokeless. The others tried to stall off this move by declining to do business at \$3.25.

A large proportion of Illinois screenings that have been clogging mine tracks throughout the state have been unloaded at low prices. Domestic sizes are selling at all sorts of prices from \$3 up, while producers look forward for a strengthening of demand within two or three weeks.

Slow production gets continually slower in the Illinois fields. Railroad storage coal is easing off in the south fields making all sizes harder to move. In the Mt. Olive region the tonnage of steam sizes is sold up on contract and domestic is hard to move.

Warm weather seems to have killed St. Louis business, where a little apartment-house and school coal has been going in steadily. Steam business is not picking up even though very little lump is being made in the fields shipping to that city. Household display no interest in anthracite in spite of a price jump of 25c. retail and a warning of shortage in case of a strike.

Kentucky Salesmen Work Harder

Kentucky producers realize now more than ever that they must have effective selling organizations. They are drawing

back good men released during easier times and a general high-pressure effort is noticeable. Demand has fallen flat for almost every kind of Kentucky coal and there continues a general closing down among plants not equipped to prepare their output properly. The embargo against lake shipments to Toledo compresses the market painfully and has resulted in cheap coal enough to produce demoralizing conditions.

The bituminous coal market at Duluth remains weak. Old screenings are offered as low as \$3.75. New screen-

Coal Age Index of Spot Prices Bituminous Coal F.O.B. Mines

	1923	1922	1921	1920	1919	1918	1917	1916	1915	1914	1913
Index	197	203	205	301	246	238	203	205	246	238	197
Weighted average price	\$2.38	\$2.46	\$2.48	\$3.64							

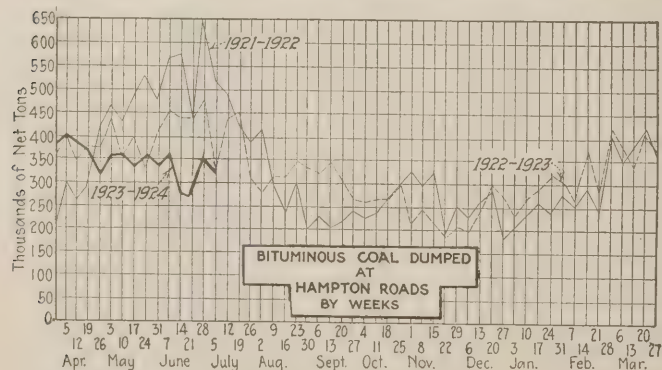

This diagram shows the relative, not the actual, prices on four-teen coals, representative of nearly 90 per cent of the bituminous output of the United States weighted first with respect to the proportions each of slack, prepared and run-of-mine normally shipped, and second, with respect to the tonnage of each normally produced. The average thus obtained was compared with the average for the twelve months ended June, 1914, as 100, after the manner adopted in the report on "Prices of Coal and Coke, 1913, 1918," published by the Geological Survey and the War Industries Board.

ings have sold under \$4.25, which is considered standard at present. There is general talk of a 50c. anthracite advance in everything but buckwheat, to take effect Aug. 1.

The Milwaukee market continues dull. Demand from the city and immediate vicinity is very slow. Country consumers are doing most of the ordering now. Prices hold steady.

Doldrums Prevail in Southwest

The Southwest is still marking time. With two Kansas City retail boosts in Arkansas semi-anthracite in as many

months, and the promise of another 50c. advance at the end of this month, householders still are showing no interest in storing. There has been no change in Kansas prices, and operators say there is no immediate prospect of any. Threshing demand and industrial contracts keep the mines open one or two days a week.

The market in Colorado is inactive. No changes have been made in lignite prices. Industrial market for lignite is unsteady. Little or no slack is being made and there is a low supply of mine run. Prices increased 25c. on bituminous and semi-anthracite lump and nut July 1.

In Utah it is likely the present shortage rate will continue a few more weeks.

Buyers Scarce in Ohio Markets

Business at Cincinnati is practically at a standstill, following the holiday. Buyers are scarce with most of the tonnage moved going to the steel mills. West Virginia 2-in. lump is quoted at \$2.50@\$3, as compared with \$2.50@\$2.75 last week and southeastern Kentucky 2-in. lump at \$2.50@\$3, as compared with \$2.50@\$2.75. Conditions at Columbus are unsettled, with buying reduced to a minimum. Steam-coal users are in the market only for immediate needs, while there is a fair demand by the railroads and public utilities. Manufacturers are buying in the open market at low prices. With more mines closing, distressed coals are being gradually reduced. Production in the Eastern Ohio No. 8 district declined slightly during the week ended June 30 as compared with the previous week, the mines operating about 65 per cent of full time. The steam and retail trade is quiet. Fewer mines are in operation in northern West Virginia than there were in June, due to market conditions and low prices. Demand is lacking.

The weakness in the Pittsburgh market last week was in gas lump coal, in which there was a marked falling off in demand, due in part to a slight decline in steel operations. The Buffalo market is dull, with plenty of coal on hand awaiting buyers.

Dullness Continues in New England

In the New England market there is no material change. Quotations are only nominal, for the most part, and consumers show little interest. Buying is restricted almost entirely to small purchases for users of small tonnages and the trade sees little prospect of improvement during July.

At Hampton Roads there is little inquiry. Prices f.o.b. vessel receded to \$5 per gross ton for Navy Standard coals, with a few sales of No. 2 grades for \$4.75 and less. The volume of coal changing hands is very light indeed, and wholesale curtailment at the mines will soon so affect the available supply as to make it extremely difficult to put together a cargo of a few thousand tons except by bidding a figure higher than anything recently quoted. On the strength of this situation some of the agencies are predicting quotations of over \$6 in the near future.

Seaboard Market Dull but Optimistic

Demand is slow at New York tidewater, with quotations for most coals easier. Producers and shippers are optimistic however, and look for increased interest within the next few weeks. High-grade coals showed a tendency of being a little scarce in the Philadelphia market after the holiday, especially with those users who buy only for immediate needs and demand quick delivery. The soft-coal market at Baltimore is spotty, although the healthy export demand gives it a better tone than it otherwise would have. Buying at Birmingham is practically at a standstill.

There was a considerable drop in lake movement to Duluth last week because many boats went up light after ore, in order to prevent vessels being tied up over the holiday. Only fifty cargoes arrived during the week, of which eight contained anthracite. It is estimated that on June 1 there was in stock at Duluth 3,000,000 tons of bituminous coal and 200,000 tons of anthracite. Up to July 5 there had been received at Milwaukee 327,519 tons of anthracite and 1,142,881 tons of bituminous coal. Dumpings at Lake Erie ports during the week ended July 9 was 1,017,973 net tons of cargo coal and 54,854 tons of fuel coal, making the total dumpings for the season 11,290,657 tons.

Anthracite Consumers Show Interest

Now that the demands of the anthracite miners have been presented to the operators, consumers are becoming a little more anxious regarding their next winter's fuel. At the New York tidewater, however, retail dealers are not buying any more of the independent product than is absolutely necessary, but it is said that demand inland is heavy. As is the case in New York, retail dealers in Philadelphia have sufficient orders booked to carry them through the next few months. Dealers at Baltimore have received more orders since the demands of the miners have become known. Anthracite production during the week ended June 30 was well over the 2,000,000-ton mark, says the Geological

Survey. According to reports from the nine principal anthracite carriers, 39,901 cars were loaded, from which it is estimated the total output, including mine fuel, local sales, and product of washeries and dredges, was 2,087,000 tons.

Car Loadings, Surplusages and Shortages

	Cars Loaded

Foreign Market
And Export News

Better Inquiry for Welsh Coals

There was a further decline in Great Britain's coal output during the week ended June 23, when 5,588,000 tons were produced, says a cable to *Coal Age*. The output for the previous week was 5,651,000 tons and for the week ended June 9 5,654,000 tons. The Welsh coal market is quiet but unsettled, and new business is very restricted. The decline in prices in the last two weeks has resulted in better inquiry. Welsh anthracite coal is an exception to the general rule. The production of the best classes of anthracite has not kept up with demand, and this coal still sells at top figures. Rail and dock facilities at Welsh ports have considerably improved. There is a slight improvement in the Newcastle market.

French Coal Market in Good Condition

The French coal situation is in good condition. Demand for domestic coals is active while industrial coals which had become much easier are again strong. The industrial activity in the north of France particularly in the textile trades, is now satisfactory. Coal imports from Great Britain have declined somewhat. Receipts from South Wales during the week ended June 10 were 170,000 tons as compared with 270,000 tons the previous week. From June 1 to June 10 the French

Office des Houillères Sinistrées received from occupied German territories 69,000 metric tons of coal, 56,000 tons of coke and 8,000 tons of lignite briquets. Since June 10 shipments from the Ruhr, especially of coke, have marked a substantial increase.

Prices at Hampton Roads Decline

Business at Hampton Roads last week continued to drag, in the face of declining prices, which reached the lowest level since 1921. Some slight decrease in dumpings was recorded. Foreign business held fairly strong, while bunkers was good, but coastwise trade showed a reaction to the season's laxity. Reports indicated that a number of operations in West Virginia and southwest Virginia are about to close down, because of the falling prices and the slump in demand.

News Items From Field and Trade

ALABAMA

The Pratt Consolidated Coal Co. is constructing a long sidetrack from its present railroad connections to the site of several new drift mines which it is developing near Dora, in Walker County.

The union miners who have been on strike at the Beltona Mines of the American Fuel Co. for the past two months have been notified of the withdrawal of strike benefits which have been paid by the United Mine Workers since the men went out. Operation of the mine was not seriously crippled for any length of time, the places of the strikers being filled without much trouble. It is stated by an official of the company that no agreement of any kind was made with the men who have been on strike, the mine having operated on an open-shop basis for the past two months and will continue to do so. The Beltona local was perhaps the largest in the district working under a union agreement.

A meeting of dealers and exporters of coal at the Gulf ports will be held in Birmingham at an early date with operators, sales agents, representatives of railroads and others interested in the building up and further expansion of the bunkering and export outlet for Alabama coal. Matters of freight rates, handling facilities, standardization of grades and qualities and other germane subjects will receive attention in an effort to bring about a greatly increased consumption of coal from this source. It is believed that the coal trade with Central and South American countries, West Indies, Windward Islands and other foreign points can be greatly increased with the proper standardization, assuring purchasers of getting a supply of uniform and dependable quality of fuel.

ALASKA

E. L. Bedell and Leopold David of the Alaska Bituminous Coal Co., at Anchorage, have gone to Seattle to complete arrangements for exporting coal to that city. The coal will be mined in the Moose Creek fields, where a spur is being rushed to completion. Five hundred men will be employed in the mining operations, according to Mr. Bedell.

Coal mined in Alaska has been placed on the market, according to reports received by the Department of the Interior from the Alaska mining station of the Bureau of Mines. It is now being retailed at Juneau, capital of the territory, at a lower price than is asked for British Columbia coal. The coal being sold comes from the Suntrana field of Alaska. Further information is to the effect that the Suntrana coal is proving very satisfactory for household use. During the past month the Bureau of Mines collected and analyzed 250 samples of coal from the Matanuska and Nenana fields of Alaska.

COLORADO

Coal production in Colorado for the first five months of 1923 increased 691,000 tons over a similar period the preceding year, according to the report of the State Coal Mine Inspector, James Dalrymple, for the month of May. Total production for the period was 4,269,897 compared with 3,378,787 for 1922. Production for the month of May was 732,473 tons.

ILLINOIS

The United Electric Coal Co. of Danville, is opening a new coal tract between Danville and Oakwood. The new field is to the north of the old one. In getting one of the big shovels out of the old field into the new it was deemed necessary to cut slightly into a river levee, which weakened it. High water, with heavy currents caused two old properties to be flooded. No. 6 mine was not seriously damaged but the No. 1 strip mine was flooded to a depth of 30 feet, the large shovels being barely visible in the water. Pumps with a capacity of 500,000 gallons an hour are being used to clear the pits.

The Norwood-White Coal Co. has opened a new coal property between Herrold and Grimes. The vein is 200 ft. below the surface and runs 4 to 5½ ft. in thickness and is uniform in depth over the entire holding of the company, which is approximately 1,000 acres. A shaft has been sunk and the superstructure erected and some coal has been hoisted.

The Oberheide Coal Co., 1355 Bradley Street, Chicago, has incorporated to mine and sell coal. The incorporators are: C. H. Oberheide, Fred Oberheide and William Oberheide.

Almost every official, great or small, involved in any way with the Herrin massacre of June 21, 1922, is charged with failure to properly perform his duty, a committee of the Illinois Legislature has reported after making an investigation. The committee condemned almost everybody except Governor Len Small, and omitted mention of that executive. Nothing of importance was developed by the committee. It complains because the State Senate blocked the continuance of the committee's work. A number of witnesses escaped appearing before the committee by the simple expedient of "disappearing" during the life of the committee.

George E. Haskins, purchasing agent, International Harvester Co., and James A. Galligan, assistant to the president, By-Products Coke Corporation, have resigned their positions to become vice-presidents of W. H. Harris, Inc., Chicago, wholesale dealers in coal and coke. The name of the company will be changed to W. H. Harris & Co.

KANSAS

Coal production in Kansas in 1922 was more than half a million tons less than the production for 1921, according to the annual production report of P. E. Keegan, statistical clerk in the office of James Sherwood, chief state mining engineer. The tonnage in 1922 was 3,518,243, as compared with 4,028,625 tons produced in 1921. Nine deaths resulted from accidents in the mines in 1922, the report shows, compared with fourteen the year preceding. In producing the tonnage last year the mines worked an average of 139 days, with a total of 9,626 employees. In 1921 the mines worked 151 days with 10,416 men. The mines upon which the report is based were distributed over the state as follows: Deep mines—Crawford County, 179; Cherokee County, 101; Osage County, 24; Leavenworth County, 4; strip mines—Crawford County, 15; Cherokee County, 14.

KENTUCKY

In the opening address at the meeting of the Kentucky Tax Commissioners' Conference at Frankfort, June 27, Rainey T. Wells, member of the State Tax Commission, declared that since 1917 the assessment of fourteen coal-producing counties of the State have been increased nearly 175 per cent, while the increase on the 106 agricultural counties has been but 90 per cent. This increase on coal lands, he said, refuted charges made by the press that the coal lands of the state are escaping taxation.

The political situation in Kentucky has swung around until it now looks more favorable to the coal interests of the state in the fall gubernatorial election. There have been many prospective candidates, several of whom were favoring a coal tonnage tax and other heavy taxation on the operators, and have attacked licensed racetrack betting. The Republican party on June 26 nominated Charles I. Dawson to carry its banner. Mr. Dawson, who is attorney general of the state, is a resident of Pineville, in the heart of the coal fields, and is not attacking either coal or racing. The Democratic nomination has not been made, but it appears to be between Alvin Barkley, of Paducah, and J. C. Cantrill, of Lexington. Mr. Barkley has been campaigning against racing and the coal producers right along, while Cantrill appears to favor the coal trade. Mr. Cantrill has become ill and may not be able to stay in the race. This would leave the campaign probably between Daw-

son, Republican, and Barkley. Dawson will have the advantage because the State is normally Republican now.

MISSOURI

The Mendota Mining Co. has been incorporated at St. Joseph, Mo., with a capital of \$200,000, and will do a general coal-operating business. The incorporators are Bertha C. Collins, J. J. Casey and J. H. Karnes.

The Co-operative Block Coal Co., of Macon, a large mine operated on the co-operative partnership basis by the miners, is meeting with success, and recently a dividend of 75c. per man per working day was declared by the company. This dividend is declared from the profits above operating expenses and goes to each man as a sort of a bonus over his \$7.50 per day wage. The rather remarkable result has been achieved in a vein of unusually hard bituminous coal, running from 20 to 22 in. in thickness. The co-operative method has been employed at the mine for a year and a half.

MONTANA

The Northern Pacific Railway has been authorized by the Interstate Commerce Commission to build a 31-mile branch line into the coal fields of Rosebud County, over which to haul coal, primarily for its own use. Extensive deposits are said to exist in this district.

NEW YORK

Dividends declared and awaiting payment, as reported currently in the Annalist include the following coal companies:

	Rate Per	Payable	Books close
Consol. Coal...	1½ Q	July 31	July 14
Davis Coal & Coke	\$3 ..	July 16	June 30
Del. L. & W. Coal	\$1.25 Q	July 16	June 30
Lehigh Coal & Nav.	\$1 Q	Aug. 31	July 31
Pittsburgh Coal. 1	Q	July 25	July 10
Pittsburgh Coal. 1½	Q	July 25	July 10
Sterling Coal... 1	..	July 3	June 20

Tentative awards for coal deliveries to State institutions recently announced by the State Department of Purchase, Albany, include the following: School of Agriculture, Delhi, 100 gross tons pea coal, to Perryman-Burns Coal Co., New York City, \$9.49 per ton; State Normal School, Brockport, 30 gross tons chestnut and 600 gross tons grate coal, Brockport Coal Co., \$15.28 per ton; State Normal School, Buffalo, 500 gross tons egg coal, George F. Francis, \$14.29 per ton; State Reservation, Saratoga Springs, 600 net tons No. 1 buckwheat, Lee Coal Co., New York City, \$5.99 per ton; State Normal School, Potsdam, 800 gross tons grate coal, 150 gross tons egg coal, and 125 net tons run of mine bituminous coal, to Eastern Fuel Co., New York City, at \$16.04, \$16.29 and \$5.29 per ton each, respectively; State Normal School, Oneonta, 500 net tons ½ lump, to Cleveland & Buffalo Coal Co., Buffalo, \$5.72 per ton, and 100 gross tons egg and 20 gross tons chestnut coal to Oneonta Coal & Supply Corp., at \$13.35 per ton each; State Normal School, Fredonia, 450 net tons 1½ lump coal, to Burton Coal Co., Buffalo, \$4.64 per ton; Institute of Applied Agriculture, Farmingdale, 40 gross tons each of chestnut and stove coal, Martin F. Shea, New York City, \$10.50 per ton, f.o.b. mine; 900 net tons run of mine bituminous coal, to Moreland Coal & Coke Co., Pittsburgh, \$5.14 per ton delivered; Department of Public Buildings, Albany, 8,000 net tons buckwheat No. 1, to Martin F. Shea, New York City, at \$5.64, and 825 gross tons stove coal, E. W. Howell Coal Co., Albany, at \$13.40 per ton delivered in bins; Mattawan State Hospital, Beacon, 4,200 net tons, run of mine bituminous coal, to Shawnee Fuel Co., New York City, at \$5.77 per ton.

Roger M. Magee has become associated with Fred D. Gearhart, Inc., New York City, as sales representative for all points in southern Jersey.

NORTH DAKOTA

The strike at Beulah of some 200 miners, now out for four months, has received the approval of officers of the United Mine Workers, which approves the demands of the local. The miners demand the operation of the mine under the eight-hour law, the right to weigh the coal under a checker hired by themselves and recognition of the union.

OHIO

A deal is about to be closed for the sale of the interests of **Henry Watkins in the Consolidated Mining Co.**, which has properties in the Hocking Valley, to **A. L. Groff** of New Straitsville, and **F. A. Sharshall**, of Shawnee. It is believed that another corporation will be organized to take over the property.

The **Raven Coal Mining Co.**, Steubenville, has been chartered with a capital of \$300,000 to operate coal mines and sell coal and coke. Incorporators are **Lee Van Tilburg**, **R. D. Stone**, **John Peterson**, **E. M. Morrow** and **M. H. Francis**.

Among Cleveland coal companies chartered recently are the **American Fuel Co.**, with an authorized capital of \$100,000, to produce and sell coal, by **E. W. Leeper** and others, and the **Denison Coal & Supply Co.**, a retail concern with a capital of \$25,000 by **George A. Naul** and others.

Trans-Michigan-Ohio railroad shippers' advisory committee to give the receivers and senders of freight a voice in opinion and car service problems of the railroads was formed in Toledo recently. **L. G. Macomber**, traffic commissioner of the Chamber of Commerce, Toledo, was named chairman; **H. M. Griggs**, manager of the Ore & Coal Exchange, Cleveland, was named vice-chairman, and **F. H. Baer**, traffic commissioner of the Cleveland Chamber of Commerce, was elected secretary.

OKLAHOMA

The **Arkansas Fuel Co.** has been incorporated in McAlester, with a capital of \$10,000, by **E. P. Joyner** and **J. G. Puterbaugh**, both of McAlester, and **T. H. Niles**, of Muskogee.

The mines and washer of the **Howe & McCurtain Coal & Coke Co.** at Howe were reopened July 1, when construction work was completed.

PENNSYLVANIA

The following bituminous coal companies were incorporated recently at the State Department: **Ringgold Coal Co.**, mining and preparing coal for the market; **Timblin**, capital, \$24,000; incorporators, **H. E. Kordes**, **Timblin**, treasurer; **J. F. Young**, **Mayport**, **R. D. A.** and **W. R. Freas**, **Ringgold**. **Turkey Hollow Coal Co.**, Monessen, mining and preparing coal for the market; \$50,000; incorporators, **C. F. Thomas**, **O. G. Frazier** and **M. H. Bamford**, **Demora**; **Eli H. Wolf**, **Monessen**, treasurer. **Reed Coal Mining Co.**, mining, quarrying, coal, stone and clay; **Bakerton**, **P. O. Elmora**; \$5,000; incorporators, **Robert P. Reed**, **Bakerton**, treasurer; **Edgar P. Reed**, **Bakerton**, and **Walter Jones**, **Ebensburg**.

Thirty-eight coal-producing companies during the past spring planted 1,137,175 trees, according to the State Forestry Department. These trees reforested 1,200 acres of idle land, and when they reach maturity they will yield at least 36,000,000 board ft. of lumber.

Important issues are raised in a strike of coal miners which has continued for two months or more at the **Cramer shaft** of the **Northwestern Mining & Exchange Co.**, generally regarded as the **Erie R.R.** interests' bituminous asset, near **DuBois**, **Clearfield County**. One of the results of the strike may be a suit against the **United Mine Workers**, District No. 2, for monetary damages based on the actual financial loss caused by eight or ten weeks' stoppage of work and failure to deliver coal. Employees of the **Cramer shaft** struck to enforce a demand that a wage differential be paid there because, as they allege, the coal seam is thin. After exhausting all other methods of obtaining an adjustment of the issue on the scale basis, the board has appealed to the board of arbitration in the district.

When a wreck occurred in the **Pennsylvania R.R.** east-bound tunnel about three miles east of **Spruce Creek**, June 22, one of the **Bethlehem Mines Corporation's** mine-rescue teams, in charge of **Edmund Williams**, trainer, and **Special Mining Engineer J. W. Bair**, was rushed to the wreck, all men supplied with helmets and all necessary first-aid equipment. Seven of the railroad workmen overcome by heat and smoke were brought outside and given first-aid treatment by members of the **U.S. Bureau of Mines** rescue car, **Red Cross** nurses, and the **Bethlehem** rescue team. The **Bethlehem** team was held at the tunnel until noon of the following day, when all danger was past.

The late **Captain W. A. May**, president of the **Pennsylvania Coal Co.**, and **Hillside**

Coal & Iron Co., left personal property valued at \$457,935.04, according to an inventory filed with Register of Wills **Harry T. Madden**, at **Scranton**. One of the items inventoried is salary due June 1, \$3,333.33. The inventory does not disclose if this represents one month's salary.

An agreement has been reached by counsel to continue trial of the case of the **Scranton Coal Co.** against the **Richter Coal Co.** without a jury, saving 300 pages of testimony from going into the discard. A jury was empanelled last January and since that time two jurors have died. A recess was taken in March. The case will now be heard by Judge **William T. Maxwell**, of **Towanda**. Before the taking of testimony is resumed it is intended that all parties to the litigation, including Judge **Maxwell**, shall visit the property in dispute, known as the **Canevin tract**.

The **Blue Lick Coal Co.**, which has recently been incorporated, contemplates the largest development in the history of the **Meyersdale** field. The promoters are **Frederick Rowe**, **Frederick E. Rowe**, **Clarence F. Rowe** and **Clyde J. Rowe**, all well known coal operators and residents of **Myersdale**, with the exception of **Clyde J. Rowe**, a resident of **Frostburg**, who has oversight of the **Rowe** coal mining properties in the vicinity of **Mount Savage** and north to **Wellersburg**.

An appeal will be taken by the companies involved against assessments of \$400,000,000 on the coal lands of **Schuylkill County** which includes an absolute increase of about \$325,000,000. Already 150 appeals have been filed. Some of the companies have paid their taxes under protest and some others have paid hundreds of dollars in penalties. If the companies lose in their law suits they will be obliged to pay one-half of the total taxes in the coal region towns hereafter and their officers have asserted that they cannot pay such heavy taxes, especially where the coal lands, as in **Pottsville**, are not being actively mined.

The **Penn Central Light & Power Co.**, Altoona, has purchased a tract of 2,500 acres of coal land in **Broad Top** township, **Bedford County**, from the **Kay Coal Mining Co.**, for \$230,000. The coal land is situated near the new **Saxton** power plant now being constructed by the **Penn Central**.

UTAH

The **Sevier Valley Coal Co.**, of **Richfield**, has increased its capital stock from \$250,000 to \$500,000. This is in order that greater development of the property may be made.

VIRGINIA

The **Dominion Coal Co.**, **Sydney, N. S.**, has ordered twelve colliers to **Norfolk** to load coal for **Canada**, on account of the strike of miners there. The coal for this shipment is on hand at the piers and can be loaded without delay. It is expected the ships will take in the neighborhood of 100,000 tons on each trip.

The **Supreme Court of Appeals** will review the case of the **State of Virginia** against **Castner, Curran & Bullitt**, coal operators and steamship owners, for collection of taxes on business during 1916-1918. The company is chartered in **New Jersey**, but was taxed in **Virginia**, and the **Virginia** courts have upheld the company. The state will appeal the case.

WEST VIRGINIA

During the last week of June a deal was consummated in the **Winding Gulf** district under the terms of which the plants, assets and properties of the **Lynwin Coal Co.** at **Mistletoe**, on the **Virginian Ry.** were purchased by **John A. Boone**, of **Beckley**.

Walter B. Thurmond, of **Logan**, formerly president of the **Logan Operators Association** and one of the leading operators in the **Logan** district, in association with others has organized the **Logan Eagle Collieries Co.**, for the purpose of operating on an extensive scale in the **Logan** field. The new concern is capitalized at \$500,000. Associated with **Mr. Thurmond** are his father, **J. S. Thurmond**; **J. Cary Alderson**, **W. R. Lilly**, of **Logan**; and **Angus MacDonald**, of **Charleston**.

The **Pax Mining Co.** has increased its capital from \$100,000 to \$300,000. The capital stock of the **Deep Hollow Coal Co.** has been decreased from \$50,000 to \$10,000.

The following foreign coal corporations have been authorized to transact business

in **West Virginia**: **Bertha-Consumers Co.**, of which **John H. Jones**, of 1203 **Chamber of Commerce Building**, **Pittsburgh, Pa.**, is president; **Brydon Brothers Coal Corporation**, of **Maryland**, of which **Harry G. Fisher**, of **Keyser, W. Va.**, is secretary; **Dundonald Coal Co.**, incorporated under the laws of **Delaware**, of which **W. G. Cochran**, of **Tioga, W. Va.**, is secretary; **Atlas Coal & Coke Co.**, of **Chicago, Ill.**

The **Moke Co-operative Coal Co.**, which has been operated for just about a year under the co-operative plan, with all workers owning stock in the mine, has held its first meeting of stockholders since the organization of the company in June, 1922, and has elected the following officers and directors: **W. L. Moke**, of **Clarksburg**, president; **F. M. Wattles**, of **New York**, vice president; **R. F. Holden**, of **Clarksburg**, secretary-treasurer; **John McNicol** and **John Elliott**, directors. Officers of the company assert that under the co-operative system the company has been highly successful, operating without interruption since the company was organized except at such times as lack of cars made operation impossible.

Increased production at the mines of the **Consolidation Coal Co.** in the **Georges Creek** field as a result of the larger number of men at work is due to the fact that over 100 men who had been on strike since April, 1922, returned to work during the closing days of June, so that the company now has a working force of about 850 men. With men returning to work at this rate, the backbone of the strike in the **Georges Creek** region has been broken, operators assert, notwithstanding the fact that the strikers are receiving about \$40,000 a week in benefits from the **International union**. No striking miner who has applied for work has been turned down, it is stated.

WASHINGTON

E. P. Lucas, general manager of the **Bellingham** coal mines, was elected president of the **Washington Coal Producers' Association** June 21. The association includes most of the open-shop operators of the state. **Prescott Oakes**, president of the **Roslyn Fuel Co.**, was chosen vice-president and **W. E. Maltby** was re-elected secretary-manager.

CANADA

Output of coal from **Canadian** mines during **March**, according to the monthly report of the **Dominion Bureau of Statistics**, amounted to 1,457,000 net tons, a decrease of 11 per cent from the total for the previous month but an increase of 12 per cent over the average for that month during the preceding three years. Production in **Alberta** showed a decrease of 202,000 tons and in **Saskatchewan** 2,000 tons, while the output for **British Columbia** was the same. **Nova Scotia** and **New Brunswick** reported increases of 24,000 and 3,000 tons respectively. The cumulative output from all mines for the first three months of 1923 amounted to 4,858,400 tons, which was 22 per cent above the three-year average for that period. Imports of coal during **March** were 1,817,700 tons, compared with 1,326,200 tons during **February**. Total importations during the three months were 4,785,600 tons, an increase of 33 per cent over the three-year average for the period. Exports of **Canadian** coal in **March** were 284,500 tons, compared with 185,000 tons in **February**. Comparison of **March** exports with the preceding three-year average for that month showed an increase of 41 per cent.

The steel and coal industries of the **British Empire Steel Corporation** at **Cape Breton** have been completely tied up by a strike of 8,000 coal miners who went out in sympathy with the steel workers who were striking for increased pay and the establishment of the check-off system. Troops were sent to maintain order and the miners demanded the withdrawal of the soldiers. Serious rioting has occurred but the presence of the military has restored order.

Obituary

Death has claimed **M. S. Browning**, of **Ogden, Utah**, widely known capitalist and director in the **Lion Coal Co.**, of that city. **Mr. Browning** died in the office of an attorney friend. He was 63 years of age.

Association Activities

Once again J. G. Bradley, former president of the National Coal Association, was elected as president of the **West Virginia Coal Association** at the annual meeting of that organization held during the convention of the National Coal Association at Atlantic City recently. Mr. Bradley is president of the Elk River Coal & Lumber Co. Ever since the West Virginia Coal Association was revived during the war, Mr. Bradley has been chosen year after year as its head. Vice presidents elected at the Atlantic City meeting were Everett Drennen, president of the West Virginia Coal & Coke Co., of Elkins, W. Va., and G. H. Caperton, of Charleston, W. Va. Walter H. Cunningham, who has served the association long and faithfully, was again chosen as the secretary of the organization.

The **Colorado & New Mexico Coal Operators Association** held its annual meeting and election of officers June 21 at the Denver Athletic club in Denver, Colo. Traffic problems were principal points of discussion. The following directors were elected: J. F. Welborn, J. J. Roche, W. H. Huff, F. R. Wood, S. M. Perry, Frank Bulkley, L. A. Hayden, J. Van Houten, H. F. Nash, W. D. Brennen and S. S. Murphy. All are prominent western operators. Following the meeting of the board of directors, these officers were selected: F. R. Wood, president; H. F. Nash, vice-president, and F. O. Sandstrom, re-elected secretary-treasurer and traffic manager.

Trade Literature

Pennsylvania Hammer Crushers. Pennsylvania Crusher Co., Philadelphia, Pa. Bulletin 1005. Pp. 15; 8x11 in.; illustrated. The armorframe single-roll coal crusher and steel-built top-feed hammer crusher are described on page 11, the former being built in capacities of 10 to 400 tons hourly for reducing run-of-mine bituminous coal to sizes required for automatic stokers and preparatory to pulverizing, and the latter specialized for preparing run-of-mine coal for stoker use and for the preliminary reduction in pulverized-fuel installations. Features of these crushers are their heavy fabricated unbreakable steel frames, all-

steel rotor, adjustable steel cage and patented tramp iron separator.

The Sullivan "Turbinair" Hoist. Single Drum, Type "HA." Sullivan Machinery Co., Chicago, Ill. Bulletin 76C. Pp. 11; 6x9 in.; illustrated. This bulletin while a reprint of an earlier edition contains additional matter. This hoist meets the demand for a small, compact but powerful portable hoisting engine for numerous uses in mines.

Sullivan "Turbinair" Hoist. Double Drum Type "HDA." Sullivan Machinery Co., Chicago, Ill. Bulletin 76D. Pp. 15; 6x9 in.; illustrated. This bulletin, like No. 76C, is a reprint of an earlier edition and contains additional material.

Link-Belt Electric Hoists and Overhead Cranes. Link-Belt Co., Chicago, Ill. Book 480. Pp. 32; 8x11; illustrated. This attractively bound book, in bright red cover, shows the many applications to which these hoists and cranes may be put.

Traffic News

The **Baltimore & Ohio R.R.** has announced the sale of the Sandy Valley & Elkhorn and Millers Creek railroads to the Consolidated Coal Co. and the sale of the Long Fork Ry. to the Chesapeake & Ohio R.R. The two transactions involve approximately \$8,000,000, of which \$6,000,000 is said to have been paid for the Sandy Valley & Elkhorn and Miller's Creek railroads and \$2,000,000 for the Long Fork Ry. It was said by officials of the Baltimore & Ohio that the contract was closed pending approval of the Interstate Commerce Commission. Funds from the sale, it was stated, would be used to develop Baltimore & Ohio property in West Virginia.

From June 1 to June 15 this year, 4,934 new freight cars were placed in service by the railroads of the country, says the American Railway Association, bringing the total number of new freight cars placed in service since Jan. 1, 1923, up to 70,594. One hundred and forty-three new locomotives also were delivered, and placed in service during the same period which brought the total number of new locomotives delivered since Jan. 1, 1923, up to 1,840. Of the new freight cars delivered by car builders to the railroads, coal cars, 28,757. The railroads on June 15 also had on order and awaiting delivery, 104,068 new freight cars, and 1,993 new locomotives.

Fewer freight cars are now in need of repair than at any time since January, 1921, according to reports filed July 2 by the carriers with the Car Service Division of the American Railway Association. These reports showed that on June 15 200,784 freight cars of various kinds, or 8.9 per cent of the total number on line, were in need of repair. This was a decrease of 10,932 since June 1, at which time there were 211,766, or 9.4 per cent. During the first 15 days in June, 1,280,277 freight cars were repaired and turned out of the shops. This was an increase of 102,320 freight cars over the number repaired during the period extending from May 15 to June 1.

Locomotives in need of repair on June 15 totaled 12,659, or 19.9 per cent of the total number on line, according to reports filed with the car service division of the American Railway Association. This was a decrease of 24 locomotives compared with the number in need of repair on June 1, at which time there were 12,683. The railroads of the country also repaired and turned out of the shops from June 1 to June 15 a total of 18,937 locomotives, compared with 21,406 during the last half of May.

The **New York Central R.R.** carried 2,255,616 net tons less of coal and coke in 1922 than it did in the previous year, as a result of the strikes in the anthracite and bituminous coal fields. During the twelve months ended Dec. 31 last 4,294,575 tons of anthracite was carried, as compared with 7,620,195 tons in 1921, 25,683,530 tons of bituminous as against 24,819,035 tons, and 736,430 tons of coke, as compared with 530,923 tons. Anthracite shipments decreased 3,325,620 tons, while bituminous and coke shipments increased 864,497 and 205,507 tons, respectively. Coal cars equipped for service on Dec. 31, 1922, numbered 55,621 as compared with 57,947 on the corresponding day of the previous year. There were 749,700 net tons of anthracite transported by the Boston & Albany R.R., one of the leased lines of the New York Central, during the year ended Dec. 31, 1922, as compared with 1,492,975 tons in the previous year, a decrease of 743,275

tons, while bituminous coal carried during the same period was 1,788,110 tons, as against 1,772,804 tons, an increase of 15,306 tons, and coke 132,689 tons as compared with 67,318 tons, an increase of 65,371 tons. Coal cars equipped for service on Dec. 31, 1922, numbered 1,446, as compared with 1,535 on the last day of the previous year. The Ohio Central Lines, also leased by the New York Central, carried 6,888 tons of anthracite, 6,005,996 tons of bituminous and 57,458 tons of coke during the year 1922. These lines had in service on Dec. 31, 1922, 13,229 coal and coke cars. The annual report of the New York Central R.R. states that mechanical facilities are being installed in the coal handling plant at Ashtabula Harbor, Ohio, for the transferring of coal from cars to fueling lighters and to tugs.

The **Erie R.R.** carried over its lines during the twelve months ended Dec. 31, 1922, 6,079,508 tons of anthracite, 7,797,689 tons of bituminous coal and 744,218 tons of coke, as compared with 9,973,687, 6,959,744 and 675,929 tons, respectively, in the previous twelve months. There was a decrease of \$11,861,149.44 in revenue for hauling coal and coke, as compared with the previous year, receipts in 1922 being \$21,353,924.49 as against \$33,215,073.93 in 1921.

Weston Dodson & Co., Inc., has attacked the rates on birdseye anthracite in effect between Winton, Pa., and North Adams, Mass.

The Interstate Commerce Commission has ruled against the contention of the Anaconda Copper Mining Co. as to unreasonable charges on coke from Sunnyside, Utah, to Black Eagle, Mont.

Alfred C. Dent and **W. T. Smith**, vice-presidents of W. A. Harriman & Co., and **Joseph Kraus**, vice-president of the Union Trust Co., of Cleveland, were elected directors of the **Pittsburgh & West Virginia R.R. Co.** on June 28, to represent the Tuttle-Harriman interests, following the closing of the latter's option on the 32,500 shares of stock of the railway company. The deal, involving approximately \$2,215,000, was engineered by the Tuttle Coal Corporation and W. A. Harriman & Co. through their representatives. The purchase was made from the Metropolitan Life Insurance Co. C. E. Tuttle was elected a director of the Pittsburgh & West Virginia at a recent meeting. No new chairman of the board was elected. Besides electing directors to the Pittsburgh & West Virginia, the new interests elected A. C. Dent and C. E. Tuttle as directors of the West Side Belt Line, a subsidiary of the Pittsburgh & West Virginia.

Coming Meetings

Oklahoma Coal Operators' Association will hold its annual meeting Sept. 13 at McAlester, Okla. Secretary, A. C. Casey, McAlester, Okla.

Rocky Mountain Coal Mining Institute will hold its summer meeting Aug. 27 to 29 at Salt Lake City, Utah, in conjunction with the **International Safety and First-Aid Meet.** Secretary, Benedict Shubart, Denver, Colo.

National Safety Council will hold its twelfth annual safety convention at the Buffalo Statler Hotel, Buffalo, N. Y., Oct. 1-5. Managing director and secretary, W. H. Cameron, 168 No. Michigan Ave., Chicago, Ill.

The **American Institute of Mining and Metallurgical Engineers** will hold its annual meeting in Canada. The meeting will start Aug. 20 at Toronto and end Aug. 30 at Montreal. Secretary F. F. Sharpless, 29 West 39th Street, New York City.

Coal Mining Institute of America will hold its annual meeting Dec. 19, 20 and 21 at Pittsburgh, Pa. Secretary, H. D. Mason, Jr., Chamber of Commerce Building, Pittsburgh, Pa.

The **American Mining Congress** will hold its twenty-sixth annual convention in conjunction with the **National Exposition of Mines and Mining Equipment**, Sept. 24-29, at the Milwaukee Auditorium, Milwaukee, Wis. Secretary, J. F. Callbreath, Washington, D. C.

New York State Coal Merchants' Association will hold its annual convention on Sept. 10-12 at Sacandaga Park, N. Y. Executive secretary, G. W. F. Woodside, 250 Arkay Building, Albany, N. Y.

COAL AGE

The Only National Paper Devoted to Coal Mining and Coal Marketing

C. E. LESHER, *Editor*

Volume 24

NEW YORK, JULY 19, 1923

Number 3

Assigned Cars

NOTHING has so disturbed the equanimity of the railroad men and sobered the soft-coal producers as the sweeping decision of the Interstate Commerce Commission in the matter of assigned cars. The operators began their fight against the practice in an organized way in 1918 through the Fuel Administration and later carried it into Congress in an effort to have assigned cars prohibited by the Transportation Act of 1920. The National Coal Association has been a consistent opponent of what it considers a form of special privilege, and after carefully exempting private cars from its attacks, has carried the fight through the several years to a victory in this decision of the commission.

The conclusions of a majority of the commission were unexpected by both sides. On the railroad side it was generally expected that the legality under the Transportation Act of the use of assigned cars would be sustained. So it was, and yet the railroads lost because it was further held that unless the Interstate Commerce Commission specify the occasion, such use of cars is not to be allowed. Which is to say that, having disposed of the case in one way on points of law, the commission turned around and, taking economic jurisdiction, rendered final verdict in another quarter.

The railroads have determined to ask the commission for a rehearing. It does not seem reasonable to expect that they will get concessions, not to mention a reversal, even if they get the rehearing. The Interstate Commerce Commission is concerned, but not overmuch, with precedent, and when a majority of the commissioners say that "The rule evolved in the earlier decisions [Hocking, Traer and Hillsdale] was not the fruition of ripe experience" and proceed to reach a conclusion based on the experience of the six years from 1917 to 1922, in which there was every shade of car supply, one is warranted in inferring that they are not going to change again very soon.

But if the railroads were surprised at the decision as respects the use of assigned system cars, the operators were taken back at the inclusion in the ban of private cars. A number of large, prosperous coal companies are owners of private coal cars. Many consumers, particularly public utilities and steel companies, have their own cars for coal. The investment in such cars, around \$30,000,000, has been made because of the advantage that accrues to the ownership during times of car shortage. In previous assaults on the assigned car for railroad fuel, the private car has been exempted. The Fuel Administration and the Railroad Administration did not disturb the customary use of the private car. Thus it has come to be more or less accepted that because the cars are privately owned they are entirely at the disposition of the owner, and that any other disposition would be in violation of the constitutional inhibition against confiscation of private

property. Any action that may be taken by private car owners to upset the decision of the Commerce Commission probably will be grounded on that premise.

It must be granted at the outset that had the commission undertaken to differentiate between privately owned and system cars in the matter of assigning to particular use it would have dropped into deep water. The gradation from the cars of a producer of coal through those of an industrial consumer or a public utility to those off an off-line carrier not originating coal is scarcely discernible. And what ground is there for distinguishing between the cars of an off-line carrier set apart for fuel-coal loading and those of an originating carrier when designated for the same purpose? The jurisdiction of the Interstate Commerce Commission over private cars appears to come when these cars enter the service of the carriers and become "instrumentalities of interstate commerce." They are none the less private property on which return is supposed to be made through the charges paid by the roads for their use, as prescribed by the commission. Private-car owners are considering testing the power of the Interstate Commerce Commission over their property as set forth in this decision.

Assigned cars are not abolished forever. However much their use by the railroads may be unreasonable and prejudicial, the Interstate Commerce Commission in the same decision says that hereafter it may in emergencies authorize their use for particular cases. The general tenor of the decision indicates that what is contemplated are service orders giving car preference not only to railroads but to utilities and others in distress. It is quite clearly indicated that the commission has found no substitute for assigned cars and by its promise to care for the needy and negligent in emergencies it has robbed the decision of much of its sting for those who fought to uphold the system. When there is need for fine distinction in the distribution of coal the government will take on the job. But, as Commissioner Hall pointed out in his dissenting opinion, it is rather difficult to understand how a practice that is discriminatory when practiced by the railroads can be otherwise when indulged by the commission.

By this decision the Interstate Commerce Commission has not solved the problem of assigned and private cars, except it listen to its own counsel.

GEORGE CUSHING HAS WRITTEN an analysis and criticism of the anthracite report of the Coal Commission. He finds that the conclusions of that body are all at variance with the facts as found, at odds with decisions of the Supreme Court, that less than satisfactory information was obtained on all major points, that the report presages general regulation of the coal industry, that the report is quite clumsily written and hardly worth anyone's time to read. He also finds that it is hardly understandable; the data confusing. If he can

frame any more adverse criticism he will spill it later. Cushing naturally would take this sort of sweeping position. He would have said the same had the angel Gabriel or George Cushing written the report. No one takes his opinion seriously, least of all Cushing, as he admits in the same article. He says: "From present indications the report of the Coal Commission will make no change in the policy of the coal industry. The bituminous-coal operators' case is still in court. They cannot change policy without doubting the fairness of the commission. *This, they have [despite what I have said] no reason to do.*"

Common Sense versus Cold Law

WHY not settle all these disputes between coal shippers and buyers by common sense instead of by cold law—or chance? Are there not better places than formal courts of law wherein to decide whether certain consignments of coal were up to standard of quality; whether quotations were correct; whether the refusal of coal was right and proper under the contract? At present there is no other recourse in case of dispute than to a court. Yet where breathes the coal producer who has not suffered by miscarriages of justice in cases of suit to collect from shifty buyers? That court sits in the buyer's county. The jury is composed of the buyer's fellow citizens. Where sentiment plays a part the advantage naturally lies with the buyer. Therefore producers, above all others in the coal industry, should be keen for a change that promises to raise the factor of justice in litigation.

Arbitration may do it. Arbitration, properly backed by statute, is getting a thorough trial in industrial disputes. The idea is spreading through the United States. Various industries, thinking of the harassments to the proper conduct of their business relations, are giving the matter serious consideration. The American Wholesale Coal Association has taken the lead in the coal industry. It is time operators also did some serious thinking. They should study arbitration's possibilities. Then, convinced of its merits, as they must be, they should join forces with other business interests to see that necessary supporting legislation is written on the statute books of every state.

There is nothing new about the principle of arbitration. There is nothing new in today's movement to get it generally adopted by industry, as described elsewhere in this issue, except that many a man has a new vision of its value to him. The movement is merely evidence that an old, old idea finally has sunk in far enough to stimulate the motor sense. After all these years of casual talk something actually is being done about arbitration in business. States are passing acts recognizing it as a standard method of meting out justice, and are clothing it with legal authority. In such states—notably New York—clauses are being written into contracts of all sorts in various industries, requiring arbitration of any disputes that may arise. Arbitrators, be they groups chosen by the litigants or boards set up within industries or single "judges" selected by whatever means, are actually settling disputes. The thing is at work.

What is the coal industry going to do about it? Surely it would be of value to producers and sellers of coal to set up within the industry bars of justice where disputes could get speedy attention and speedy

settlement, instead of the laggard recognition so often accorded even in the best-organized court of law. Surely it would be good for the coal industry if coal disputes could be settled by men who know coal from A to izzard instead of by a judge who knows cold law and by twelve butchers, bakers and candlestick makers who know when they've had enough. Long-winded harangues and vast bulks of technical testimony by "experts" make any average American jury tired of its job and ready to decide a coal case easily by a flip of a coin.

But arbitration is not something for nothing. It promises to remedy business evils in coal only if the men of the industry are willing to give time and effort to practice it. Somebody has to be the arbitrator. That arbitrator in each case must be a man whose judgment is recognized as sound and whose integrity is above reproach. There are enough such men in the country. They must be ready to serve. Also associations, groups and individuals must support the idea and seriously strive to make the arbitration contract clause universal.

Arbitration must be by methods so eminently sound and the personnel of arbitration boards must be of such high character that any honest and reasonable business man would be glad to subscribe to the clause in a contract when it is presented for his signature. It must not be arbitration by and for the producer as against the jobber, retailer and consumer; nor yet arbitration by and for the jobber as against the rest. There can be no arbitration where there is even a suspicion of prejudice. This thing must be entered upon high-mindedly and with justice as its single purpose. And there is no better time for such an enterprise in coal than now, when the industry is in a state of flux, when coal men would do well to prove that they can settle their own problems, and when, if ever, there is need to display common sense.

TORRENTS OF WORDS often fail where a few accomplish the purpose. A traffic expert said the other day, "I used to hear so many long-winded speeches to the Interstate Commerce Commission and used to see so readily the fatigue they brought the commission that I made up my mind I never would exceed 10 minutes in any such case. It is a good plan. I'm sure I get more results." Why not? Any commission or any individual grasps most easily facts and ideas stripped of all non-essentials. In the coal industry, as everywhere, intelligent brevity is valuable, whether in association reports, convention speeches, presentation of cases or whatnot. Condensing a 100-word idea into 10 words in a speech requires effort. But the idea "gets home" with more force. And Oh! the relief it brings the hearers!

EX-SENATOR WILLIAM M. CALDER admits, in an interview published in the Brooklyn *Eagle* of July 9, that it was through his efforts that the Coal Commission was brought into existence and that its findings, as a result of a most comprehensive study, are substantially in accord with his report on coal to the Senate, except that Mr. Hammond and his associates have made recommendations more drastic than those proposed by the former Senator from New York—and Brooklyn. What Mr. Calder has to say on coal always is entertaining to the coal industry.

Rosedale Byproduct Coke Ovens And What They Accomplish

Steep Grades and Undermining by Coal Workings Make Oven Construction Expensive—Semet-Solvay Ovens Have Automatic Reversal of Flue Gas—Keeping Carbon Out of Tar—Coal Mixture Used and Byproducts Obtained

BY GEORGE ATWELL RICHARDSON*
Philadelphia, Pa.

THE byproduct coke plants of the Cambria Steel Co. at Johnstown, Pa., form integral parts of two groups, the Rosedale and Franklin units, each comprising: (1) The mines from which the coal is hauled and brought directly into the coal-washer buildings; (2) the coal washer and subsidiary buildings, where the coal is washed and then mixed with coal from other mines to form the proper coking mixture; (3) the byproduct coke-oven plants, where the mixed coals are converted into coke for use in the manufacturing plants of the Cambria Steel Co. and into byproducts which are manufactured mainly for outside consumption.

In previous articles only the first two of the integral

same interesting features. When it comes to a discussion of the third division it is necessary to describe both plants, for two reasons: (1) Because the byproduct equipment at the Franklin plant is in every way as recent as that at Rosedale, being erected at the same time, and (2) because the plants are different, that at Franklin being equipped for the separation of light oils into their constituents, whereas that at Rosedale is not.

In several ways the Rosedale plant is unusual. At the time of its completion in 1922 it was one of the largest byproduct coke-oven installations ever constructed from the standpoint of actual quantities of materials used. Not only this but the location—on the steep side of a hill and in a deep, narrow valley—introduced engineering problems that would not ordinarily be encountered. These included the furnishing of an adequate and economical supply of coal, the washing and preparation for coking, all described in earlier articles, and more particularly the design and construction of the ovens and byproduct-plant buildings and equipment.

Hinckston Run is the name of a small waterway that flows into the Conemaugh River at a point just below the Cambria plant, west of Johnstown. At its narrowest point the comparatively level ground is less than 200 ft. wide, whereas the side of the hill on which the greater part of the plant was constructed rises sharply. The flow of water is not large, as the stream is im-

PANORAMA OF COKE OVENS FROM MINE HEADFRAME

In the center is the big coal bin holding 3,000 tons from which the larries are filled for the feeding of the coke ovens. The ovens in the foreground are of the Cambria type. Of these there are 120. In the rearground are the eighty-eight Semet-Solvay ovens with their two brick stacks.

parts of the Rosedale plant have been considered because of the newness of the equipment and the nature of the problems encountered. These same parts of the Franklin group are much older and do not have the

*Midvale Steel & Ordnance Co. and Cambria Steel Co. Since this article was received these two companies have merged with the Bethlehem Steel Co.

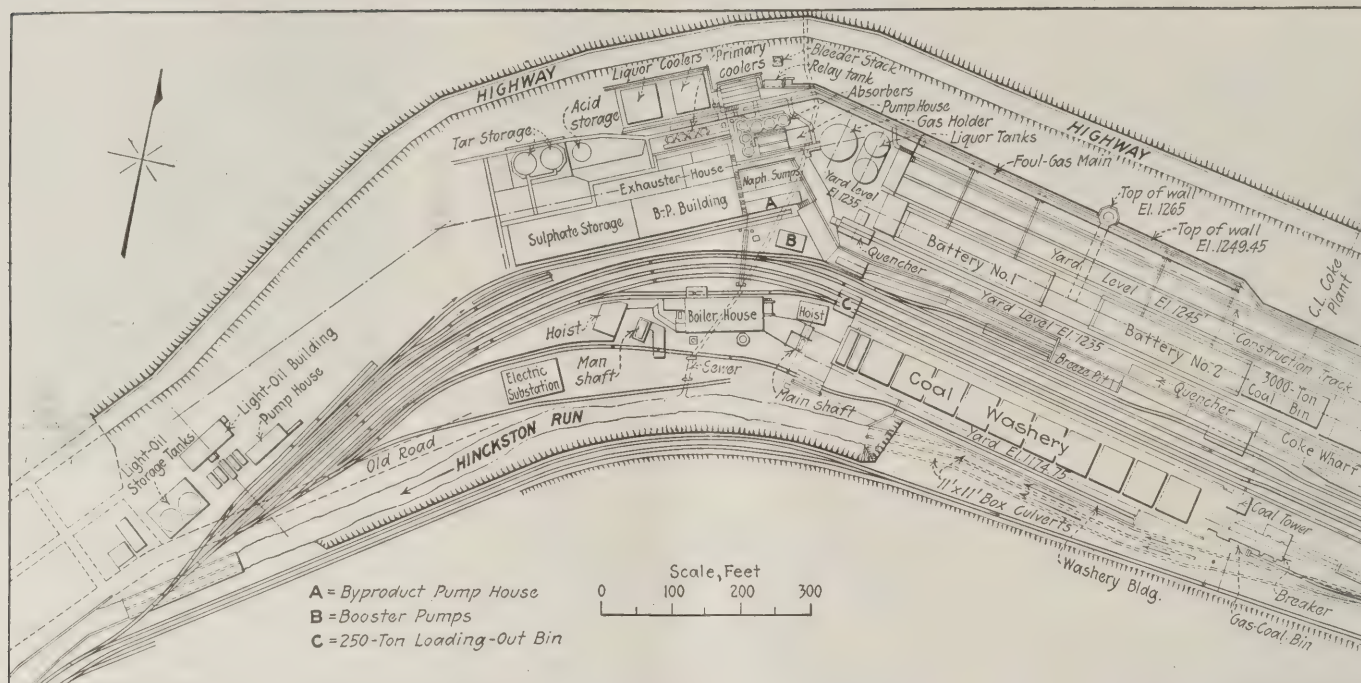

NOTE—This article is the fourth in a series of six describing an unusually interesting combination of modern mining methods and byproduct-plant practice. The three, which have already appeared, are entitled "Cambria Steel Co. Drops Coal Down Well, Loads it at Bottom and Hauls it to Ovens," "Haulage, Hoisting and Dumping Practices at Rosedale Mines" and "Rosedale Uses Bumping Tables to Wash Its Product, Mixing It for Coking Purposes with Gas Coal." They are to be found in the issues of *Coal Age* for Aug. 31, Sept. 7, 1922, and Feb. 15, 1923, respectively.

The headpiece shows the coke leaving an oven and falling red-hot into the quenching car which, containing a little water from previous quenching, is sending up a cloud of steam in which is entrained much smoke. A latticed guard keeps the coke mass intact till it reaches the edge of the wharf.

DISCHARGE SIDE OF CAMBRIA COKE OVENS

Coke is being quenched at the west tower. Note how the locomotive obtains its power and the provision made for the return circuit. The structure to the left and in the rear is the byproduct building.

WESTERN HALF, ROSEDALE BYPRODUCT PLANT; RECOVERY EQUIPMENT PROPER ON LEFT, OVENS ON RIGHT

A culvert, consisting in its upper part of a 16-ft. arched waterway and in the lower end of two waterways 11 ft. square set side by side, takes the water of Hinckston Run past the coke yards, making it possible to use the full width of the valley. It has a good gradient of 1.07 per cent. The end of this culvert can be seen near the coal wash-

ery, gas-coal bin and breaker. In order to reduce excavation costs the buildings and ovens are set at different levels; thus the level of the yard below the washery building is 1,174.5 ft. and that between the draining pits and the wharf wall is on a 1.58-per cent gradient and varies in elevation from 1,192 to 1,208 ft. The wharf wall

itself is at an elevation of 1,235 ft. and the coke-pusher track yard is at an elevation of 1,245 ft. Despite this the pusher track has to be protected by a retaining wall in some places reaching an elevation of 1,260 ft., though in other places it is only 1,246 ft. above datum. A new highway had to be built around the plant at a still higher level.

pounded farther up and as the reservoir forms part of the water supply used by the Cambria Steel Co. for manufacturing purposes.

One of the first problems that presented itself was that of providing suitable working space in the middle of the valley, and this was accomplished by the construction of a 16-ft. concrete arch culvert about 1,300 ft. long which, traversing the entire length of the plant, carries past the ovens the water it receives from the stream.

The plant itself was constructed in three levels. The coal washery and other coal-handling equipment were erected in the bottom of the valley. On the second or middle level were placed the various byproduct buildings and equipment pertaining thereto, the ovens being

built on the upper level. The average slope of the ground is $1\frac{1}{2}$:1. The elevation of the base of the rail of the tracks in the bottom of the valley averages 40 to 45 ft. below that of the base of the rail of the pusher tracks.

The actual construction was carried on under great difficulties. Unexpected troubles were encountered in laying the foundations of the ovens. The material near the surface was of such a treacherous nature that it became necessary to sink the 156 caissons to solid rock. Each caisson was 6 ft. in diameter. Their average depth was 36 ft. In several instances in sinking the caissons abandoned mine galleries were entered which lay about 40 ft. below the ground, these sometimes being filled with water, which added to the difficulties. Re-

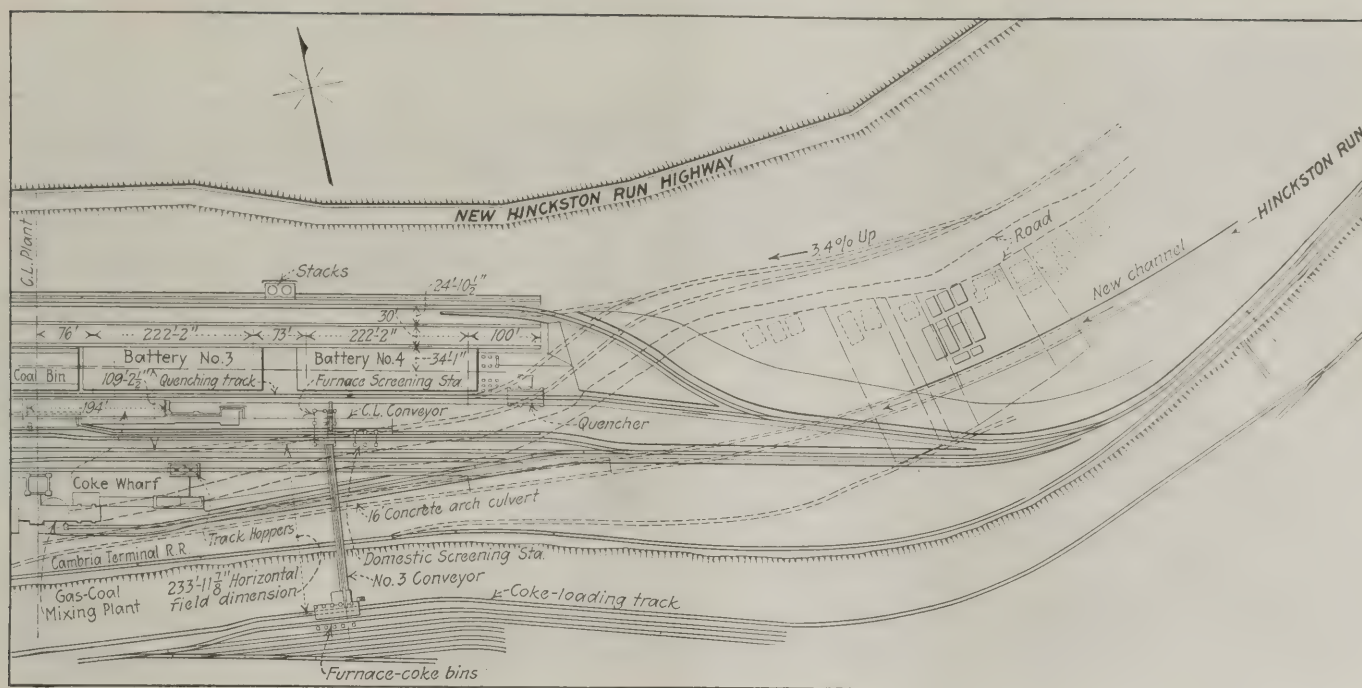

SEMET-SOLVAY OVENS SEEN FROM PUSHER SIDE

This shows one of the bridges or gantries carrying the suction main for gas and the hydraulic main which runs along the top of the ovens and collects the gases from which byproducts are obtained. Note the wide track on which the pusher runs. This is the narrow end of the ovens, the width increasing slightly toward the discharge side to facilitate the removal of the coke.

CAMBRIA-TYPE OF OVENS SEEN FROM ABOVE

On the left can be seen the rails for the coal larry and the five rows of ports by means of which the ovens are filled. On the right are the bridges by which the liquid and gaseous byproducts are conveyed to the suction or foul-gas main.

EASTERN HALF, ROSEDALE BYPRODUCT PLANT; SHOWING SEMET-SOLVAY OVENS AND COKE-HANDLING PLANT

In this plan nothing can be seen of the Cambria ovens, which lie on the far side of the big coal bin by which they and the Rosedale ovens are supplied with coal. The fill leading from the south side of the valley to the north is 35 ft. deep where it crosses the new subterranean channel made for Hinckston Run and 38 ft. deep where it

crosses the front line of the ovens, the gradient being 2.60 per cent in the northerly direction. All the slopes are made $1\frac{1}{2}$ to 1. Many difficulties had to be overcome in the building of the plant. Owing to the treacherous nature of the soil it was necessary to sink caissons 40 ft. to solid rock. In some cases abandoned mine galleries,

found full of water, added to the difficulties. Reinforced-concrete beams 6 ft. square were placed on the pillars thus erected, and these in turn were covered with a concrete slab 3 ft. thick and it was on these that the regular oven foundations were laid. The plans here published were slightly modified before construction was completed.

inforced-concrete beams 6 ft. square surmount the pedestals thus formed and these in turn are overlaid with a concrete slab 3 ft. thick upon which the ordinary oven foundations are placed. In this way all danger of settling or slippage of the ovens has been effectually eliminated.

Soil slides were another source of trouble. These had to be overcome by the construction of heavy retaining walls. In carrying out all this work more than 150,000 cu.yd. of excavation and 50,000 cu.yd. of back-filling were necessary. As the retaining walls were 2,000 ft. long they served with the foundation work to bring the quantity of concrete poured to 70,000 cu.yd.

Material handling, not only at this plant but also at Franklin, was complicated by the lack of level ground. As a result a storage plant was erected about a mile and

a half from Rosedale at a place known as "Ten Acre." Here more than 70,000 sq.ft. of covered storage space was provided, this including machine shops and equipment for doing a large part of the work of assembling. All material for the Rosedale and Franklin plants was handled at this place and aggregated more than 1,000 carloads.

Despite these initial difficulties the proximity of an almost unlimited coal supply and the possibility in any cases of substituting gravity flow for pumping, as well as other conditions, made the proposition an advantageous one. With this background, the plant itself will now be illustrated and described in detail.

Part of the coal for cooking is hoisted directly from the mines and dumped in the coal-washer building. The local coal is low in volatile constituents and non-

TOP OF SEMET-SOLVAY TYPE OF OVENS

Here the ports for filling the ovens are more plainly visible than in the illustration of the top of the Cambria-type of ovens. The pipes on the right carry the byproducts to the collecting hydraulic main. The view is taken looking west toward the coal bunkers.

MECHANISM FOR REMOVING DOORS ON DISCHARGE SIDE

This shows the equipment used at the Solvay ovens for placing and displacing doors. The building on the left houses the drier and washery and in the tower at the rear end of the building the mixed coal is elevated for transportation, by the conveyor bridge shown, to the coal bin in the center of the ovens.

ROSEDALE BYPRODUCT-OVENS AND REFINING PLANT ON HINKSTON RUN NEAR JOHNSTOWN, PA.

Only terracing made the irregular site feasible for so large a project. The 175-ft. headframe can be seen to the right of the center stack. Next to it is the coal washery where the Rosedale coal is washed and mixed with high-volatile coal. Closer in

the foreground may be seen the refining plant in which the more important byproducts are prepared for market. The light oil is condensed but goes to the Franklin plant for final refinement. Furthermore, ammonia is not made at Rosedale as a mer-

chantable product. All the ammonia obtained is used to make ammonium sulphate. The sheds in foreground are part of the construction equipment. Work was not entirely completed at the time this picture was taken, nor were all work sheds removed.

coking and must be mixed with gas or high volatile coal to produce a suitable coking mixture. For this reason, after washing, the local coal is mixed with gas coal brought from other of the company's mines and is then taken by belt conveyors to the coal bunkers over the ovens.

The Rosedale ovens, 208 in number, are contained in four blocks or batteries. Batteries Nos. 1 and 2 each contain sixty ovens of the Cambria type. Batteries Nos. 3 and 4 each with forty-four ovens are of the Semet-Solvay type. The bunker or coal-bin building, where 3,000 tons of coal can be stored, straddles the ovens at a point between batteries Nos. 2 and 3, and the larries that charge the ovens are themselves charged by gravity.

The Cambria and the Semet-Solvay types of ovens thus combined in a single plant have many points of difference. The Cambria oven takes a charge of 10.5

gross tons whereas the charge of the Semet-Solvay oven will average 15.5 tons. The coking time also is longer, in the first case averaging about 24 hours as compared with 15 to 16 hours in the second. If necessary, however, the pushing could be done every 20 hours in the first case. When running at maximum capacity the ovens as a whole therefore may be estimated to coke about 3,500 gross tons of coal per day.

Both types of ovens are of the modern regenerator type, but the method of burning the gas used for heating varies considerably. In the Solvay ovens there are five gas inlets or ports, two on the pusher side and three on the coke side, which admit the gas to various parts of the flue. In the Cambria ovens the gas is mixed with the air and ignited underneath the ovens and the resulting flame then passes up through the flues.

Two electrically operated charging larries are used in charging the various blocks. All the ovens have five

COKE PUSHER AT SEMET-SOLVAY OVENS

A wide area has to be provided for a coke pusher, for when not pushing the ram stands out well behind the extremely wide-gage truck on which it is carried. The power of these rams obviously must be great to accord with the great depth of the coke in the oven. In this instance a big retaining wall had to be erected back of the area allotted to the pusher track and the ram clearance.

LARRIES WITH SPOUTED HOPPERS ON CAMBRIA OVENS

Three larries are shown here drawn up, one behind the other. Each hopper is provided with the proper quantity of coal to fill its section of the oven without waste and without deficiency—an important item in economical operation.

holes in the top for charging, there being spouts on the larries for each opening. The doors of the ovens are sealed with mud which is ground and mixed in the coal-bunker building.

The flow of air is automatically controlled in the Solvay batteries. Induced draft is used and the damper which regulates the flow is equipped with red- and green-light signals. The governor consists of a spring set against a float at given pressure. Electrical contacts are established by means of which the controls are regulated. The direction of the flue gases is automatically reversed at 15 minute intervals, a bell ringing to show that it has taken place. The Cambria batteries are manually, not automatically, controlled.

There is some question as to the real value of automatic control. Some feel that it is unnecessary, as a watch must be kept to see that the change in direction takes place with the desired frequency. It is argued that the very fact that the action is automatic leads to carelessness, which might have serious results should anything go wrong with the apparatus. The other, and what in my opinion appears to be the more logical, viewpoint is that automatic control is desirable if for no other reason than that it insures regular and uniform operation.

The following data are continuously recorded: (1) the gas pressure on (a) the coke side and (b) the pusher side of the ovens; (2) the reversing time; (3) the stack draft on (a) the coke side and (b) pusher side of ovens. In addition ordinary tube pressure gages indicate the gas pressure and ordinary inclined-tube

COAL BUNKERS AND PUSHER SIDE, CAMBRIA OVENS
In the foreground is the foul-gas main and in the rear the washery and the Rosedale shaft headframe. The coal bunkers are large enough to hold 3,000 tons of coal.

draft gages the stack draft. A Venturi meter measures the flow of gases. Each battery of Solvay ovens is entirely independent and has separate dampers, reversal mechanism, stacks, etc.

In charging the Semet-Solvay ovens it is customary to leave the damper open in the outlet which leads from the oven to the foul-gas main. This not only protects the men but serves to prevent carbon from getting into the tar. Practice of this kind is largely a matter of convenience and in some sections is not allowed on account of the smoke. The Cambria ovens are not provided with these dampers, one damper in the foul-gas main of those ovens controlling the entire battery. The dampers in the Semet-Solvay units also serve to regulate the back pressure if the suction fails.

For economical operation it is important that the ovens be charged with the correct quantity of coal. If the charge is made too small the oven space is not being

ELECTRIC LOCOMOTIVE WITH COKE-QUENCHER CAR
The coke ovens are pushed one by one and the hot coke loaded into the quencher car, taken to the quencher tower, shown in the rear, drenched with a measured quantity of water and then dumped as shown in Fig. 12.

used economically. On the other hand coal is wasted when the ovens are charged with an excess of coal, for the leveler pushes it out of the oven. Sometimes this wasted coal is put back on the next charge, but it is better to throw it away as it burns up and so is wasted regardless of the effort expended.

It has been stated already that the coal mined in the locality of Johnstown has to be mixed with other coal and it will be of interest to note the general composition and possibilities of the various kinds of coal now being used.

Local coal is low in volatile matter and analyzes roughly as follows when washed and later dried at 105 deg. C.:

Constituents	Percentage
Volatile matter.....	18.99
Fixed carbon.....	72.79
Ash.....	8.22
	100.00
Sulphur.....	1.51

This coal not only gives a small yield of byproducts but is likely to break down the oven walls owing to the excessive expansion that occurs when the coking process produces too small a quantity of gas. Leaving this danger out of consideration, the average yield per net ton would run about as follows:

Tar	4 gal.	Sulphate of Ammonia	17.1 lb.
Gas	10,050 cu.ft.	Coke	84.2 per cent
Light oil	2.3 gal.		

The light oil is estimated to contain 55 per cent of benzene and 12 per cent of toluene.

DUMPING A LOAD OF COKE FROM QUENCHER CAR
The coke is still too warm to handle, so it is allowed to fall on a steel slope set at about the angle of rest of coke. As it is conveyed away other coke slides down and is carried away in its turn. The action is almost automatic but sometimes a man with a light tool has to push the coke down the slope.

Coals from the Cambria Steel Co.'s mines at Slickville and from the Union Coal & Coke Co.'s mines at Marianna and Acme analyze as follows:

Constituents	Slickville Mines Percentage	Marianna and Acme Mines Percentage
Volatile matter.....	33.08	34.60
Fixed carbon.....	57.11	58.46
Ash.....	9.81	6.94
Sulphur.....	100.00	100.00
	1.42	1.15

The practical yield per net ton of these would be:

Byproducts	Slickville Mines Quantity	Marianna and Acme Mines Quantity
Tar.....	9.3 gal.	10.1 gal.
Sulphate of ammonia.....	24.5 lb.	25.7 lb.
Gas.....	10,500 cu. ft.	10,600 cu. ft.
Coke.....	70.4 per cent	70.0 per cent
Light oil.....	4.1 gal.	4.2 gal.

The light oil in each case is estimated to contain 50 per cent benzene and 15 per cent toluene.

The usual mix runs about 60 per cent low-volatile and 40 per cent high-volatile coal which will yield *per net ton*:

Tar	7.5 gal.	Coke 70 per cent of coal
Sulphate	24 lb.	Weak liquor 30 gal.
Gas	10,500 cu. ft.	Light oil 3 gal.

The mix is varied, however, to meet conditions and the coal available. The foregoing yields, as noted, are

COKE WHARF LOOKING TOWARD THE EAST

Here the wharf, which is 200 ft. long, is filled almost full of coke. In the rear can be seen the building to which the coke is carried by the conveyor for screening and crushing. Here coke passing over a 4-in. grizzly is crushed to smaller and more suitable sizes.

per net ton. The estimated daily yield of the four batteries of ovens based on charging 3,500 gross tons per day gives the following:

Furnace coke.....	2,695 gross tons
Domestic coke.....	40 gross tons
Breeze.....	65 gross tons
Sulphate ammonia.....	104,000 lb.
Light oil.....	12,000 gal.
Tar.....	32,000 gal.
Surplus gas.....	25,000,000 cu. ft.

For handling the coke, quenching cars 40 ft. long are provided, each of which is attached to a 27-ton electric locomotive. After the coke has been pushed from the ovens into the cars it is taken to one of two quenching towers (there is one at each end of the entire layout) where it is quenched with water for about 40 seconds. The breeze, which goes with the water through the bottom of the car, amounts to about 1.4 per cent of the weight of the coke quenched. It is collected and sent to the dump, as it cannot be used. The water from the quenching towers drains down into a sump and is circulated over and over with the same pump, the neces-

COKE CONVEYOR BELTWAY AND CRUSHER BUILDING

All the coke that will pass over a grizzly with $\frac{3}{4}$ -in. spaces is taken by a 250-ft. belt conveyor to the furnace loading station, where a shuttle conveyor distributes it into a 250-ton bin. Coke between $\frac{3}{4}$ in. and $\frac{1}{2}$ in. is loaded out for domestic use. The breeze is used at the boiler house of the plant.

sary additions being made to take care of water lost in the quenching operation.

After quenching the coke is brought back to a 200-ft. inclined coke wharf where it is dumped. Long-toothed gates control its admission to a 42-in. conveyor belt which takes it to the screening station.

There the coke passes over a rotary grizzly screen with 4-in. spaces. The oversize coke is then crushed, and all the material is then conveyed by a belt to a second grizzly having $\frac{3}{4}$ -in. spaces. The coke that passes over this grizzly is taken by a belt conveyor 250 ft. long across the valley to the furnace loading station, where it is distributed by a shuttle conveyor into a 250-ton inclined bin specially designed for the loading of the coke into cars without breakage.

The undersize coke which passes through the grizzly is conveyed to a shaking screen of the standard type where all that is over $\frac{1}{2}$ -in. in size is separated out for domestic use. The breeze is loaded into cars and used

GALLERY UNDER SEMET-SOLVAY TYPE OF OVENS

This illustration shows the fuel-gas main and burner pipes. The view is taken on the pusher side of the ovens and looking west. The explosion and control valves are shown in the foreground.

at the plant boiler house. A crusher also is provided which can be used to crush the $\frac{1}{2}$ -in. size still smaller when there is no demand for the larger coke in the domestic market.

IF FRANCE WILL ONLY WAIT a little while the German offers will be offers to accept an indemnity.—New York Tribune.

Welding and Brazing Practices That Make Repairs Easy

Building the Fire—Repairing a Broken Machine Casting—Good Job Gives Part 80% Per Cent of Its Original Strength—Preparing the Work—Various Kinds of Fluxes—Causes of Poor Weld

BY GUSTAV RADEBAUGH
University of Illinois, Urbana, Ill.

ONE of the most important essentials in all forge work is a good fire. Many failures of brazing and welding are caused not by the kind of material used, as is commonly supposed, but by poor heating in a poor fire. Although not generally appreciated, mostly all the brazing and welding difficulties that a beginner encounters are in the fire. The usual blacksmith fire is called an open fire, and it is used for general forging work.

As noted in the operations, care must be exercised in building a good clean fire. The only way this can be accomplished is by removing all the old dead material and sorting all coke from the fire before discarding. Always save the coke, as no better material can be obtained for use in a forge fire. The smith is sometimes wasteful with coke and it is discarded with the ashes, but every little piece should be saved. Clean coke is by many considered preferable to charcoal for brazing, because it makes a more even fire.

Coal that will coke must be the best grade of soft or bituminous coal. Good blacksmith coal will coke easily and also is free from sulphur. If much sulphur exists in the coal, it will make welding and brazing a difficult operation. A good method to test coal for forge use is to break a lump. If it breaks easily, crumbling into small grains, and the newly fractured faces show up bright, it is in all probability good firing coal. The coal should crumble rather than split up into layers. Soft coal used for home firing is not good for forge use, as it makes a dirty fire. A few bushels of regular blacksmith coal will last a long time.

In some brazing jobs a heavy scale may rise on the work when heating. This scale is called oxide and is caused by air coming in contact with the job while heating. To prevent this, use a good thick fire—that is, have an abundance of firing material between the tuyere and the work.

The preparing of the fire bed is important. For the average fire for shop jobs a block $3\frac{1}{2} \times 3\frac{1}{2}$ in. can be used. This block is placed over the tuyere, as shown in Fig. 1. The blacksmith coal is then dampened down—this is called green coal. The green coal is now placed around the fire block as snugly as possible. After this is done the block is removed. This hole keeps the fire together and holds in the heat.

The fire is now ready to be started. Use shavings or oily rags. After lighting, as shown in Fig. 2, place them in the bottom of the fire hole and turn fan very slowly; this is necessary to prevent the firing material from going out. Break some of the pieces of coke that were placed to the rear of the hearth into small pieces. Place a few shovelfuls on the newly lighted fire. Increase the air blast just a little after the coke has been placed. After the firing material has burned for a few minutes the fire hole will become hollow. The coke is pushed into the hole by using the rake, as shown in Fig. 3.

When the coke is burning freely, Fig. 4, it is good practice to mound up the fire a little with more coke before using the green coal. The green coal is now placed on each side of the fire and it is gradually worked into the fire. When it is desired to hold a fire for a short period this is done by raking coke into a mound over the fire. It is then covered with green coal. A good method to hold a fire for a long period is by thrusting a piece of hardwood down the center of the fire before banking it.

When the fire burns freely it is ready to use. A fire that is ready to receive the stock to be heated should not be giving off much smoke. In heating a job for brazing, too much blast should not be used, as the coal requires a certain amount of air to burn thoroughly. If too much air is used the oxygen is not all burned out and this passes through and strikes the heated job, forming an oxide or scale.

The repairing or replacing of broken castings on mine machinery sometimes leads to long and costly delays. The standardizing of mine equipment, however, has made it possible to obtain repair parts without lengthy delays. But many times a repair is needed at once and even the time required to go to the commercial repair shop would be a costly delay. The kind of material in the broken piece determines nearly in all cases the method of repair. If a steel strap, bolt, rod, or steel connection is broken, it is common knowledge among all that it can be welded, or replacement can be made usually from the mine's own repair shop. But in repairing a broken casting a somewhat different problem enters into the repair job.

We find that the components of mine machinery are

FIGS. 1, 2, 3 AND 4—PREPARATION OF THE FIRE IS HIGHLY NECESSARY IN WELDING AND BRAZING Heat control is more easily accomplished and impurities in the coal prevented from entering the weld when the fire is properly built. Packing of the fuel in a form which will accommodate the material to be repaired will greatly facilitate the work.

FIGS. 5, 6, 7 AND 8—MATCHING THE BROKEN PARTS TOGETHER

After the broken casting has been cleaned of all dirt and grease it should be filed and fitted so that all parts will be properly aligned when the work is completed. Clamp-

ing and binding the casting insures a good job in the minimum amount of time. Extra handling of the specimen while hot is undesirable and is rarely necessary if the

alignment of parts is properly made and maintained by sufficient clamps. The casting should not be removed from the fire while turning it over.

made from malleable iron, cast gray iron, and steel castings. In the repairing of these castings there are several channels open for determining the best methods. The casting can be patched—that is, a steel strip or sheet can be placed on the piece with bolts or rivets. Sometimes it is necessary to forge or form the steel patch so that it will fit the shape of the casting. In malleable and steel castings, if their design permits the placing of such a patch, considerable time can be spent on the repair, as it probably would be impossible to get a new casting made in a local foundry. In cast-iron repairing, however, it is sometimes advisable to have a new casting made, as the new part would be cheaper than a repair job. Foundries that cast gray iron are found in nearly all of our larger trading centers. The broken casting can, as a rule, be used for the pattern for making the casting. If a new pattern is required, the cost would be high and it would not be advisable unless all other channels of repair had been investigated and this method found to be the only solution of the problem.

SEVERAL METHODS FOR REPAIRING

Another method that is being used successfully, especially when the mechanic doing the job understands the operation, is repairing the broken components by using the oxyacetylene process. In this method a welding flame which has an intensely high temperature—6,300 deg. F. maximum—is obtained by the combustion of acetylene and oxygen. The broken pieces are fused together when at a melting temperature.

The brazing method of repairing broken castings has not been fully appreciated by the repair man as a method of repairing that he may employ. In using this method there is no reason why even the inexperienced man cannot familiarize himself with the process and perform the operation, with a little practice, the same as a repair man in the commercial shop. In brazing, the only supplies needed are the brazing smelter or solder and flux. One good flux is the household powdered borax. The tools required are the file, hammer, pliers, wrench, forging tongs and a forge. With these few tools a good job of brazing can be done on any of the three castings named.

The brazing smelter consists of 50 per cent copper and zinc. This percentage may be changed somewhat by makers of the smelter, but a mixture of about this proportion generally is used. This is cast into ingots and granulated into grades known as long, short, and fine. The short grade usually is used for broken casting repair work. This smelter can be purchased through any local implement dealer or general supply house.

In brazing cast-iron castings, in case the borax flux does not give results, a flux of the following formula can be used: boric acid, 16 oz.; chloride of potash (pulverized), 4 oz.; carbonate of iron, 3 oz. This mixture

should be kept in a good tight jar, as moisture or long exposure to the air lessens its effectiveness. This preparation is added to the smelter just before applying it to the casting.

In brazing, all grease and dirt must be removed from the casting. This can be done by heating the casting to a dull red heat and then using a wire brush or old file to remove any particles left on the casting. The casting is then permitted to cool. The broken edges of the parts are filed and are then clamped together by using baling wire strap clamps and bolts. Sometimes a job is of such design that it can be bolted together. After the parts are joined with this clamping arrangement, the job is placed in the forge fire, which should be well coked and with a fairly deep bed. It is heated slowly until it gets to a bright yellow color. The flux is then applied separately or jointly with the smelter. This smelter and flux can be placed on the job with a rod which is flattened at the end. When brazing cast iron let it cool slowly, as sudden chilling may cause check cracks. It is estimated that if a good job of brazing is done on a casting it has within 80 per cent of its original strength.

In preparing a broken casting for brazing, Fig. 6, the casting must be thoroughly cleaned, placed in the forge fire, and heated to a dull red heat. It is then taken from the fire and the dirt and scale are easily removed with a wire brush or an old file. The edge of the casting should be beveled as shown in this view. This is done to permit easy flow of the smelter when the brazing operation is being performed.

The broken casting in position to be clamped together as shown in Fig. 7 should be fitted together and the clamping arrangement decided upon that will hold the casting in a positive position. The alignment of holes must receive careful attention when clamping, for if the holes are out of alignment there is possibility of trouble after the brazing is completed. Some mechanics have found that by placing the flux on the cracked surfaces of the job before placing them together causes the smelter to flow freely.

The clamping or fastening may be done by using screws, wires, bolts, or clamps, as shown in Fig. 8. If it is at all possible, the pieces should be held in such a way that the job can be turned over during the brazing operation without changing the alignment. This is essential in order that the brazing flux and the smelter can be placed on all sides of the casting.

A good job of brazing cannot be done unless the pieces have been securely clamped together. It pays to spend considerable time on this operation, because discouraging conditions will be encountered when the job is in the fire if the pieces are not firmly held together. Malleable castings, gray-iron castings, and steel castings can be brazed. The same brazing methods and materials are used on these castings.

After the pieces have been clamped, as shown in the preceding operation, a fire is built in the forge as already described. Heat slowly until the casting is a bright yellow. With a flattened steel rod, as shown in Fig. 9, apply the flux and smelter. This must be done while the heat is maintained at the bright yellow temperature. This smelter should run freely at this temperature. Do not remove the casting from the fire when turning it over. When you are satisfied that the smelter has flown into the break, the casting is then permitted to cool. When brazing a gray-iron casting it is good practice to permit the casting to cool with the forge fire. This will prevent check cracks.

The job is now removed from the cooled fire, and if still hot it is placed in ashes. This, of course, is not necessary unless it is thought that the casting will crack by contraction strains coming on the weaker parts of the casting. After the job has cooled so that it can be handled, the braze seam, Fig. 10, can be cleaned up with a file. The casting is now ready to place in service.

Three important essentials govern the welding of iron and steel: (a) The kind of fire; (b) shape of end prior to making weld; (c) kind of fluxes used. All of these are so important that if difficulties are encountered when welding, investigate the job for improper practice related to any of these essentials and no doubt your obstacle can be overcome.

Coke, coal and charcoal are used in a forge for heating steel or iron for welding. Bituminous coal low in sulphur is the most common fuel used. In preparing the fire for welding see to it that the fuel is free from lead, bronze or brass that may have become mixed in the fuel from previous brazing or babbitting operations. Do not try to weld with a "green" fire; see to it that the coal is well coked. The fire used for welding should have a thick bed between the tuyeres and the work. The necessity for this precaution is to hold to a minimum the amount of air that strikes the steel when being heated.

There are five common methods of forming the ends of stock prior to making a weld. They are classified as follows: Scarf weld, butt weld, lap weld, cleft or split weld, and jump weld. Reference to Fig. 11 shows the form of these different welds. In all of these but the lap weld the surface of the laps are crowned. This is very important. If brought together when hot the ends stick in the center, and upon being forged together all the slag and dirt sticking to the metal is forced from the center outward, leaving the hot metal free from any oxide of iron. In making the lap weld the hammering should begin in the center, as this has a tendency to work all the slag free from the welding surface. It is understood that a defective weld will be caused if the job is not entirely free from this scale.

Fluxes are used in welding for two purposes. Oxida-

tion of scale formation is prevented by the flux melting and covering the heated surface, and it also aids in dissolving any oxide that may have formed. Wrought iron, unless it is very thin, can be welded without flux, because it can be heated to such a high temperature that the oxide is melted. When welding machine steel or tool steel it is necessary to use fluxes. Sand and borax are the two most common fluxes used on machine or soft steel, which is the common grade of steel used.

Wrought iron is not used to any great extent. Some smiths use the borax plain, others mix it with equal quantities of fine, clean sand, putting in 25 per cent iron filings. Another good practice is to burn the borax before it is used, which yields better results. Heat the borax in a cast-iron jar until melted, pour on a bench plate or any flat surface so that it will form a sheet. Small pieces can be broken off for use or it can be pulverized, as desired. There are many welding compounds on the market, but for welding the ordinary machine steel, sand and borax are about as effective as any.

A flux that has been offered as a trade secret and sold on the market is made by this formula: Copperas, 2 oz.; saltpeter, 1 oz.; common salt, 6 oz.; black oxide of manganese, 1 oz.; prussiate of potash, 1 oz. Pulverize these ingredients and mix with them 3 lb. clean, white sand. If these fluxes will not work the fire is not as it should be or the operator does not use the proper judgment in welding heats.

For tool steel use a flux made of one part sal-ammoniac and twelve parts borax. For welding tool steel to iron or soft steel, flux made from the following formula is used: 500 parts by weight of borax, 70 parts sal-ammoniac, 70 parts prussiate potash, 35 parts clean, unrusted iron filings. Pulverize and add water until thick paste results. Heat until very thick, stirring constantly; when cold pulverize and it is ready to use.

The job is heated and the ends formed for the welds. Being soft steel it should be worked at a yellow heat, as the steel can be forged more easily to shape at this heat. After the two ends have been properly formed for the weld, being sure that the surfaces that are to be welded together are crowned as shown in the sketch, the job is ready to be heated for welding. Place in the fire the pieces to be welded, cover well with coke (not green coal), heat slowly and steadily until the steel shows a bright yellow. This is the time to make the first application of the flux either by removing the piece from the fire (this is not recommended, although it is done by some smiths), or with a flux spoon made from a $\frac{3}{8}$ -in. rod.

The heat is more rapidly increased and more flux added until a sparkling white heat is reached. When the steel has a glazed appearance and is sparkling freely, remove quickly from the fire and after a shake or a light tap to remove oxide, stick the laps together and with extremely light, rapid blows from the hammer at first and heavier blows as the weld proceeds, the job is completed. Do not work the steel too cold. If the weld cannot be finished down in one heat, reheat and work at the usual forging temperature.

FIG. 11—DIFFERENT WAYS OF MAKING A WELDED JOINT

Much depends upon the material to be welded as to the method in which the parts are prepared and the type of weld best suited for the job.

FIGS. 9 AND 10—MAKING THE WELD IN THE FIRE

The flux and smelter should be applied when the specimen has reached a predetermined temperature. During this part of the work the temperature should be maintained as near constant as possible so as to produce a uniform weld.

A Geologic Time Scale*

Classification Using Numerals as Aid in Designating the Various Group Formations—Some Modification of Existing Nomenclature Necessary

BY GEORGE H. ASHLEY
State Geologist of Pennsylvania, Harrisburg, Pa.

A GEOLOGIC TIME SCALE is based on the order and fossil content of beds of sandstone, shale, and limestone which were originally laid down as sand, mud, or limy deposits in the sea. Earth movements have lifted and locally folded these rocks while erosion has cut into or planed off and exposed the edges, allowing beds several miles thick to be studied.

Remains of organisms then living in the sea were buried with the sediments and form a record of life at that time. This life horizontally was widespread, but changed rapidly with time, so the fossils make it possible to determine what rocks were laid down at any given time.

Owing to the rapid change in life forms and the slow accumulation of the rocks, it is now possible to distinguish several hundred life zones. For example, in 1839, certain rocks in the Jura Mountains of Switzerland, called the Jurassic system, were divided into three groups, as black, brown, and white. In 1858 the same rocks were divided on fossil evidence into eighteen zones, later increased to forty, which may ultimately be divided into a hundred zones. These very thin life zones are frequently delimited by the presence of one or more of the then existing dominant species of animals or plants.

Study of the fossils and rock relations seemed to indicate long periods during which no rocks were laid down. During these "lost intervals," generally representing periods of widespread uplift, life forms changed so as to be entirely different after than before the break in sedimentation. These great breaks formed convenient lines for dividing all the rocks into ten great "systems," named from a locality or some surface feature where first described or from some other circumstances, as follows: 1, Cambrian; 2, Lower Silurian; 3, Upper Silurian; 4, Devonian; 5, Carboniferous, 6, Triassic; 7, Jurassic; 8, Cretaceous; 9, Tertiary; 10, Quaternary.

Study of other areas eventually disclosed other rocks laid down during the "lost intervals" of the earlier

geologists, until now the great "breaks" dividing the systems are nearly or quite filled. By piecing together fossil evidence from various localities, a nearly complete story of the development of life can be told, or a complete column of rocks devised.

Closing the gaps in the records by transitional beds and life forms has made it difficult to draw the line between the great systems. Broader knowledge has also revealed other major earth movements than those first known and has led many geologists to subdivide some of the larger systems so that all of the systems shall be of more nearly equal length. Furthermore, some geologists believe that these great earth movements used as time markers were rhythmic. This idea, though not widely accepted, has served as a basis for the increase in the number of systems. Certain of these subdivisions have long been recognized in this country, although not always accorded the rank of a system. Believing that their recognition as "systems" is only a matter of time, they are so designated in the accompanying time scale.

BARRELL METHOD OF ESTIMATES

A few years ago the late Professor Barrell, of Yale, made a comprehensive review of all the estimates of geologic time, including the results of the studies of radioactive minerals. He concluded that from the beginning of Cambrian time to the present was about 600 million years. Each system in the table represents from 30 to 50 million years. The figures given on the table are an average of Professor Barrell's estimates. They may be too short or much too long. The estimate for each system takes account of many factors, including, first, the area, the average and maximum thickness of rocks laid down; second, lithologic character of the rocks; third, the number and character of subdivisions already recognized or likely to be recognized in the future; fourth, contemporaneous earth movements (each system is supposed to represent in general a widespread sinking of continental areas, accompanied by deposition of sediments and followed by a general uplift).

I have found the need of adopting a standard time scale for the publications of the Pennsylvania Geological Survey. A preliminary study revealed no time scale universally accepted. State and federal surveys and textbooks differ in their usage. The principal subdivisions are the same but with major differences. For example: the U. S. Geological Survey treats the Cretaceous and Carboniferous as systems, whereas several modern textbooks divide the Cretaceous into two sys-

*Abstracted from *Engineering & Mining Journal-Press*.

tems and the Carboniferous into three systems. In starting the publications of a new series of reports it seemed desirable to review the whole subject critically and if possible to make a time scale combining the best available information.

In reaching the conclusions, all pertinent factors were considered. Thus, the Cambrian system is not divided, although it is probably as long and the rocks are several times as thick as the Silurian. Cambrian time, though apparently favorable to thick formations of rock, did not foster rapid development of life forms, so that minute subdivisions on the basis of the fossils is almost impossible. However, some of the later systems represented by relatively thin series of rocks are so fossiliferous as to be divisible into many thin zones. This division multiplied the number of individual bed names.

Neogene and Eogene, as here used, have been used for some years for the Tertiary. Textbooks have used Comanchian for Lower Cretaceous for about twenty years. Geologists recognize that the Comanchian in America is not exactly the same as the Lower Cretaceous in Europe. Cordilleran is therefore introduced to designate the time and the rocks from the end of the Comanchian to the beginning of the Eogene. Permian, Pennsylvanian, and Mississippian, as subdivisions of the Carboniferous, have been used for many years. The Ordovician, though estimated to be of nearly the same duration as the Carboniferous, has here been divided into two parts, Ordovician and Canadian. Some geologists would classify the Ozark rocks as one system, the Beekmantown and Chazy as a second, and the Mohawk and Cincinnati as a third. My studies, however, have failed to convince me that either the Ozark or Cincinnati rocks are of correlative rank with Silurian, Devonian, Pennsylvanian, or Jurassic. The Ozark "period," including the upper part of the "Ozarkian system" of Ulrich, is placed in the Canadian. The lower part of Ulrich's "Ozarkian system" is included in the Cambrian. The Cambrian, although of long duration and comprising a great thickness of rocks, is considered as one system, as it is not readily divisible.

The rocks have been divided into systems and the systems subdivided into two or three "periods," which are designated as upper, middle and lower, or upper and lower. These periods have been given names which are in general use. The Jurassic periods have not been given geographic names, because the Jurassic is not well represented in this country. Several names are used here in a broader sense than is customary. For example: Montana is used for the Upper Cordilleran, as including all rocks between the top of the Colorado and the base of the Eocene. The Montana therefore includes the Laramie, which was formerly independent. The Dakota sandstone has been included with the Colorado series in the Lower Cordilleran system.

In like manner each series or period has been divided into two to five groups, each group representing an epoch of time. Most of these groups have been known in the past as "formations" or the smallest unit that can or is likely to be shown on a map. More detailed work, however, has divided formations into named parts and subdivisions that are often recognized across several states. In illustration: The Allegheny group, (formerly the Allegheny formation), is now divided into the Freeport, Kittanning, and Clarion formations. Each of these formations is comprised of several beds of coal, clay, limestone, sandstone, and shale. Thus, the Freeport formation contains (in descending order): Free-

port, upper coal; Freeport, upper clay; Freeport, upper limestone; Bolivar, flint clay; Butler, sandstone; unnamed shales; Freeport, lower coal; Freeport, lower clay; Freeport, lower limestone; Freeport, sandstone and unnamed shales.

The time scale was made with two ideas in mind: first, to make a time scale in which the various "systems," "series," "groups," and "formations" would be of comparable rank. Thus a "group" of rocks has an average thickness of several hundred feet but usually less than a thousand feet. A "series" averages several thousand feet thick. The "systems" are usually represented by tens of thousands of feet. The "formations" are a few hundred feet thick, or more commonly less than one hundred feet. The thicker members of these correlated divisions usually represent masses of rocks apparently incapable of ready subdivision.

The second object was to devise, if possible, some method by which the position of any bed in the stratigraphic column could be handily designated. After the table was practically in the present form, I noticed that there were almost exactly one hundred epochs. Therefore, if it is assumed that all time from the beginning of the Cambrian had been divided into one hundred more or less equal epochs, and if these were numbered from 1 to 100, the general position of any epoch in the column would at once be clear. Furthermore, many rock groups in Pennsylvania, as in other places, do not exactly correlate with the epochs indicated in the time scale.

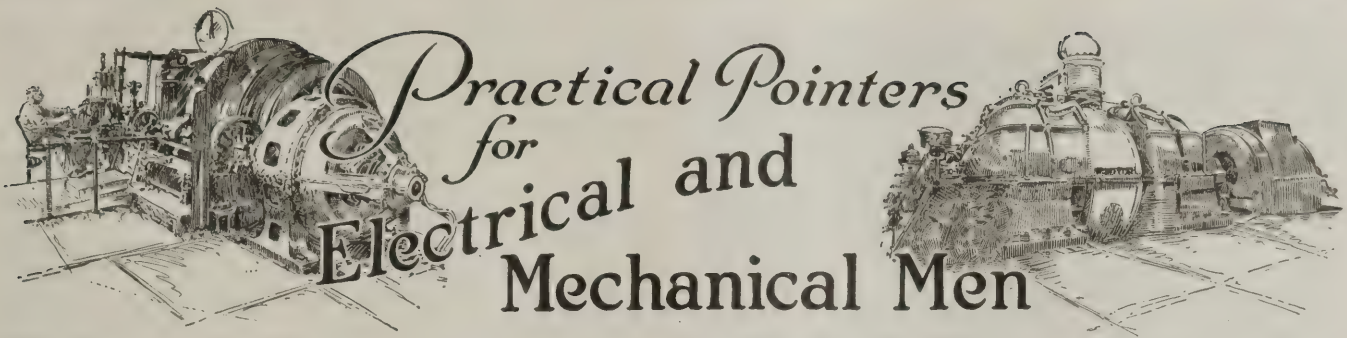

THE USE OF NUMERICAL SYMBOLS

In order to have exactly 100 epochs, the table as originally written was slightly modified. Thus, in the Upper Devonian five epochs, the Tully, Genesee, Portage, Chemung, and Catskill, were reduced to three. The Tully, a thin limestone occupying a relatively limited area in central New York, and unworthy of group rank, was combined with the Genesee. Likewise the Catskill was combined with the Chemung, as it has long been known to be in part, if not in whole, simply the eastward extension of the Chemung.

The Pennsylvania Geological Survey proposes to use the name of a formation or bed with its group name. Thus, the Becraft limestone would be referred to (except where used frequently) as the Helderberg limestone, 29 (Becraft). The name Helderberg, in use since 1838, has gained certain familiarity which at once reveals to the frequent reader of geological reports the place of the Becraft limestone. The number 29 shows that the rock is a little above the middle of the Paleozoic and should be of greater value in reminding the reader of the relative position of several beds mentioned.

In the table here given account has been taken of what might be called the "historic" periods only. Below the Cambrian lie great thicknesses of rocks believed to represent vast areas of time during which life was slowly unfolding; but of that life only the most meager traces remain unless we except limestones, iron ores, and certain other rocks as *prima-facie* evidence of life.

Thus before the Paleozoic era came the Proterozoic and Archiozoic eras, each possibly as long or longer than the Paleozoic. The Proterozoic, represented by Algonkian rocks, which in Canada are estimated to have a thickness of 74,000 ft., is divided into the Keweenaw and Huronian ages or systems. Archiozoic time, represented by Archean rocks, with an estimated thickness in Canada of 94,000 ft., has been divided into Laurentian and Keewatin time.

Safety in Gas Welding and Cutting

IN A paper recently prepared by C. F. Worfolk, of the faculty of the Michigan State Automobile School of Detroit, for the National Safety Council, the following suggestions and precautions were offered to employers of welders and welders themselves:

A canvass of industrial plants reveals the fact that burns resulting from carelessness form the majority of injuries to persons in the oxyacetylene welding trade. Injuries to the eyes due to failure to wear proper goggles are second. The employment of only properly trained men for this work would greatly reduce accidents from these two sources.

Injuries from fires and explosions due to defective apparatus are comparatively few now, thanks to the many improvements that have been made in appliances. There are some, however, and in most cases they could be prevented. We might class them, in their order of frequency, as:

CLASSIFIES INJURIES IN ORDER OF FREQUENCY

(1) *Gas fires*; due to leaky, defective, or open valves in acetylene tanks. An open valve needs no comment. It is just plain carelessness. The average welder has a tendency to become careless. Perhaps in his case familiarity breeds contempt. He is quite likely to get his torch too close to the tanks or the manifolds. Unless the shop is very well ventilated indeed, any escaping acetylene will lie near its sources and the heat of the torch will ignite it. Such a fire is difficult to extinguish. An extinguisher of the Pyrene type is no doubt one of the best means of stopping this blaze, but a tank of carbon dioxide or carbonic acid gas similar to that used in soda fountains will have such a blaze out very quickly. All welding shops should have a tank of this gas on hand for such emergencies.

(2) *Gas explosions*; due mostly to getting a mixture of the gases into a confined space and then igniting it. Shop explosions frequently are produced in this way. They are almost invariably due to leaky apparatus or to carelessness.

(3) *Tank explosions*. These are very rare, as the tanks are built to withstand very high pressure and in each tank is a safety plug intended to blow out and relieve the pressure before the bursting point is reached. The blowing out of this plug at 4,000 or 5,000 lb. pressure can be attended with very exciting results. Tank pressures are known to run up to 4,000 lb. sometimes. This is not the filled pressure; but with perhaps 1,800 or 2,000 lb. of gas in the tank if it is left in direct sunlight or in a very warm temperature the pressure begins to mount. These tanks should be stored in a cool place.

(4) *Valve explosions*. These are likely to occur only with old-style apparatus and because the operative has

let it get into bad condition. There have been many accidents with old-style apparatus but today most of it is in the discard.

Frequent and regular inspections should be made to insure proper condition of apparatus.

The operator himself presents a much more difficult problem to deal with than the apparatus he handles. He is quite likely to be a green boy unfamiliar even with the dangers attendant upon the use of ordinary city gas. Somewhere he has seen a workman use a torch and, inspired with the belief that he can do equally well, he signs a long story to the employment man and gets a job as a "welder." The worst of it is, the work looks easy. Anyone can turn on a valve and light a torch, no matter how ignorant he may be of the tremendous forces he is setting in motion. At times industry seems to be woefully short of acetylene welders and the employment man at his wits' end to obtain competent hands grasps at the first straw and so our green hand goes to work.

What does he know of hot or cold metal, of expansion or contraction? How is he going to harness this molten destruction to constructive purposes? Perhaps the boss welder gave him a few inadequate instructions. Perhaps all he said was "There's your place; hop to it." He hops. He heats a metal article of some sort and fails to mark it properly. Along comes another workman. The article looks just the same to him cold or hot and he picks it up. The first-aid man now has a nasty burn to fix up. The injured workman is off the job for a few days and there is compensation to pay for his injury and enforced vacation.

Burns form the vast majority of welding injuries. The man who gets burned is not always the welder. Burns from picking up hot metal that has not been properly marked or safeguarded lead the list. Chalking the word "hot" on the metal isn't going to help the man whose only English is "No spik Inglis" unless you tell him very forcibly what it means and train him to look out for it in the welding shop.

Mine Locomotive Taken Up Mountain Side

THE problem of getting heavy mining machinery from the railroad tracks in a deep valley to the coal tippie or mouth of the mine is sometimes very real and difficult. The Branch Coal & Coke Co. at Elverton, W. Va., recently was confronted with the task of taking a new 5-ton mine locomotive from the railroad track to the mine. The only feasible way was up the steep mountainside and it was decided to build a temporary inclined plane.

When finished the plane was 1,600 ft. long and had an average grade of 40 per cent. After the locomotive was unloaded from the railroad car it was run a short distance to the foot of the plane, where it was at-

GOING UP ITS HEAVIEST GRADE

While in service locomotives usually negotiate some stiff grades. Here is one on which the locomotive needs help.

tached to a steel rope. At the top of the plane was a small hoist run by a 6-hp. motor.

The trip up the plane was made slowly and without mishap. As a safety precaution, a drag was fitted to the rear of the locomotive as shown in the photograph. Chicago, Ill. GEORGE F. PAUL.

Care and Repair of Commutators

Cleaning.—The band over the front V-ring of a commutator should be wiped off every month. After cleaning, painting with an air drying varnish makes cleaning easier next time. Painting every six months is advisable.

Soothing Commutator Face.—Flat spots, high or low bars, ridges, burned spots, etc., should be smoothed up. The armature should be removed from the locomotive and placed in a lathe for turning the commutator if its face is very rough. Holes left by defective mica or pits in the side of bars can be filled with commutator cement supplied by dealers.

Undercutting.—The commutator should be re-undercut before it is worn flush, since the groove left will guide the saw and make the work much easier. Where commutation trouble is frequent, it is good practice to use a V-shaped hand tool to round the edges of the undercut grooves between bars to about 1/42-in. radius. This can be done with the motors in the locomotive. All particles of mica, copper or dirt should be removed from the grooves after undercutting.

Removing Leads From Commutator Neck.—A thin drift driven in the top of the slot in the neck toward the shaft between the side of the commutator neck and the top filling piece will loosen the filling piece so that it may be forced out by a gouge. Similarly, windings may be taken out of the first bar. With one set of leads removed there is enough space left to bend one side of the next neck, thus permitting the removal of the leads by means of the gouge. This can be done without heating the soldered joints.

Replacing Parts—Commutator and Winding Left on Shaft.—Where a small number of bars are to be replaced it is not necessary to remove all the leads from the armature neck to take the commutator from the shaft. Stand the armature on end, commutator up. Mark each separate piece so that it may be put back in its old position. After removing the ring nut or bolts, take out the metal V-ring and mica V-ring. If the bars are tight, tapping with a wooden or rawhide mallet will loosen them. The new bar must be filed to the shape and thickness of the one which it replaces, to prevent the

new bar or the old bars next to it becoming loose. Clean out the space where new bars fit and tap them in with a soft mallet.

Detached parts of the commutator must be kept clean and dry. When the parts are ready for rebuilding, sandpaper the mica V-ring. Clean the metal V-ring and the V in the commutator bars, and paint the V in the bars with shellac. The shellac and brush must be absolutely free from all dirt or moisture. After putting the mica V-ring and the metal V-ring back in their original positions, the ring nut or bolts are drawn up fairly tight.

Painting the threads of the ring nut or bolts with very thin white lead will make it easier to remove these parts next time. The commutator should now be heated to 110 deg. C. in an oven where the air is dry and the ring nut or the bolts drawn up tight while the commutator is hot. The commutator should then be turned in a lathe.

Test after these repairs should be 110 volts alternating current between commutator bars and 1,000 volts alternating current to ground.

Replacing Parts—Commutator Removed From Shaft.—When it is necessary to replace the rear mica V-ring, a number of segments, or a complete set of segments, it is advisable to remove the commutator from the shaft. The method of taking down and rebuilding is the same as before described, but care should be exercised, to heat the commutator thoroughly to soften up the new mica parts, so that the ring or bolts can be drawn up tight. To this end when the commutator is assembled it should be put in an oven and heated to a temperature of 125 to 140 degrees C. While at this temperature the commutator is placed in a press, using a pressure of 20 to 25 tons for a 50-hp. motor, and the ring nut is drawn up tight while under pressure.

Complete sets of segments are shipped, temporarily banded together, with the mica and copper segments in their proper position. The complete set should be assembled in the commutator as a unit and the temporary band should be removed just before the commutator is finally tightened.

Tests after these repairs should be 300 volts alternating current between commutator bars and 2,000 volts alternating current to ground.

Important Details.—Commutator well undercut $\frac{3}{4}$ -in. maximum; $\frac{1}{4}$ -in. minimum.

Front V-ring clean and well painted.

Edges of commutator face rounded, $\frac{1}{8}$ -in. radius, front; $\frac{1}{16}$ -in. radius, rear.

Commutator free from oil.

Rear of commutator sealed from dirt and moisture. Commutator tight.

Face of commutator smooth.

Neck full width

Mica extending $\frac{1}{8}$ -in. at rear.

Free from grounds and short-circuits.

12,382,000 Barrels of Cement Made in June

Production of portland cement during June, 1923, according to the U. S. Geological Survey, totaled 12,382,000 barrels compared with 11,245,000 barrels in the corresponding month of 1922 and 12,910,000 barrels in May, 1923. Shipments for the month were 13,307,000 barrels against 13,470,000 in May a year ago and 14,257,000 in May, 1923. Stocks at the end of June were 9,219,000 barrels compared with 10,718,000 barrels at that period in 1922 and 10,144,000 barrels at the end of May, 1923.

Should Speed of Air Through Inlet of Fan Be Limited to 2,000 Ft. per Minute?

BY J. R. ROBINSON

Consulting Engineer, Pittsburgh, Pa.

I AM frequently asked, "At what speed should air pass through the inlet of a fan?" and then the questioner supplements his inquiry with the words, "I know it ought not to exceed 2,000 ft. per minute, but how do you go about to find it?" When I ask him how he arrives at the 2,000 ft. per minute he usually says that he saw that figure given in some textbook or in some manufacturer's catalog.

When fans were first introduced at coal mines they were built of wood, and the carpenters who originally erected them put them together by rule of thumb with a hatchet and a saw and had no scientific data to guide them. Quite by chance the inlet, or "eye" of the fan, as it was called by the earlier builders, was made about five-eighths of the diameter of the wheel, and as these fans were slow-moving machines it also happened that the speed of the air usually did not exceed 2,000 ft. per minute through the inlet orifice of the fan.

All these things just happened, but builders of machinery are careful to copy what seem to be the most successful machines without much investigation as to why the machines are successful. If they can get them on the market and make profits from their sale they are not likely to be inclined to go further. The investigating and tabulating of data of such machines must be done by some crank who is not considered practical by the manufacturers.

INLET SPEED DETERMINED BY OUTLET SPEED

The speed of the air passing through the inlet orifice of the fan is determined directly by the speed at which the air is leaving the tips of the fan blades. It is a well-known fact that the tip speed of the fan blades determines the speed of the air leaving the blades. This tip speed is dependent on the shape of the blades and the manner in which they advance or retreat from a radial plane. But in all fans a certain tip speed is required to give a corresponding speed to the air as it leaves the blades.

Now the speed with which the air leaves the blades creates a certain pressure which is measured by the water gage, so that we have for a given water-gage reading a corresponding speed of the air, the values being interchangeable. For instance, if the water-gage reading is 1 in. the speed of the air is 3,946 ft. If the water-gage reading is 2 in. the speed of the air is 5,587 ft. If the water-gage reading is 6 in. it is 9,672 ft. per minute. Now it is obvious that if we are running our fan to make 1 in. of water gage and the speed of the air leaving the blades is 3,900 ft. we can have a higher velocity in the intake orifice of the fan than 2,000 ft. per minute, for on the outside of the wheel we have the atmospheric pressure forcing the air into the wheel to take the place of the air we expel from the wheel due to its rotation, and this atmospheric pressure is upward of 14 lb. per square inch of pressure where our 1 in. of water gage is only 5.2 lb. per square foot.

In other words, there is about 400 times as much pressure on the outside of the wheel as the depression we make on the inside of the wheel due to its rotation when we are making a 1-in. water gage. The air will

therefore find its way into the wheel due to the atmospheric pressure, and the speed at which it goes into the wheel through the intake will be directly proportional to the speed of the air as it leaves the tips of the fan blades.

It will be seen, therefore, that the fan is not performing work on the inlet of the wheel. The atmosphere takes care of that, so it may be well to cite a few illustrations of a practical nature to prove that a fan may work with the greatest economy while the air is passing through the inlet orifice at a speed greater than 2,000 ft. per minute.

INLET SPEED, 3,400 AND 6,000 FT. PER MINUTE

A 6-ft. multivane fan working at the Donald No. 2 mine of the Consolidated Coke Co., at Gray's Landing, Pa., is making 105,000 cu.ft. of air per minute at 1.6 in. water gage. It is using 41.6 hp. on this load. It is a double-inlet fan and the sum of the two intake orifices is about 38 sq.ft.

Now if no "vena contracta" is applied to this intake orifice the mean speed of the air is upward of 3,000 ft. per minute and if a "vena contracta" of 80 per cent is applied the mean speed of the air is upward of 3,400 ft. per minute. This fan is belted to a 50-hp. motor and allowing 5 per cent loss for the belt and 10 per cent loss for the motor the fan is running at about 77 per cent mechanical efficiency.

There is a 4 ft. 9-in. multiblade fan working on the Emeigh Run mine of the Cherry Tree Coal Co., near Cherry Tree, Pa., which is making 116,000 cu.-ft. of air per minute at 5.4 in. water gage. It is using 127 hp. on this load. It is a double-inlet fan and the sum of the two inlets is about 24 sq.ft. If no "vena contracta" is applied to this intake orifice the mean speed of the air is upward of 4,800 ft. per minute and if a "vena contracta" of 80 per cent is allowed the mean speed of the air is upward of 6,000 ft. per minute. This fan is direct-connected to a 150-hp. motor and, making no allowance for loss in the motor, the mechanical efficiency of the unit is upward of 77 per cent.

PLANNING TO OVERCOME IMAGINARY DIFFICULTY

Only a few years ago a number of fan builders were putting scoops on the blades of the fan wheel at the intake orifice. This practice was due to the manufacturers' want of knowledge of the natural laws governing the flow of air and also to the old myth that it was necessary to limit the speed of the intake air to 2,000 ft. per minute.

It will be seen from these illustrations that the air will find its way into the fan at upward of 2,000 ft. per minute if the fan wheel is making a pressure in excess of that required to create that speed.

This old myth of inlet orifice speed is the direct cause of many installations being wasteful of power. As an illustration of this I will cite an instance that occurred a short time ago. A coal company was about to install a fan to make 80,000 cu.ft. of air per minute when the required water-gage pressure would be 4 in. to pass the air through the mine. Owing to this old myth of the limit of 2,000 ft. per minute the company's engineer insisted on a fan much too large for the work, and it is now running at less than 30 per cent mechanical efficiency. The manufacturer who made the fan guaranteed his fan for 75 per cent mechanical efficiency and the officials at that mine are one and all still wondering now what is the matter with the installation.

Coal Men Could Settle Own Trade Disputes, Avoiding Aches and Pains of Court Action

In arbitration of business difficulties between coal men lies the cure for many harassments of coal selling, Vincent Gilroy, representing the Arbitration Society of America, told the American Wholesale Coal Association at its Cincinnati convention in June. Producers of coal, suffering periodically in disputes over price, quality and whatnot with buyers located all over the country, may see great benefits in arbitration over the cumbersome and none too just methods of American courts.

If an arbitration clause were written into every contract between producer and buyer, each agreeing to submit any disputes arising out of the contract to three coal men, one chosen by the producer one by the buyer and the third by the chosen two, or to a permanent commission, or to some other form of arbitration, the Arbitration Society of America believes much good would be accomplished including these advances over present methods of "going to court": (1) Settlements would be speedier; (2) they would be more just because the decisions would be by men who know the problems of the trade and because ignorant juries would not be confused by so-called "experts," by oratory, or by technical rules of evidence; (3) trade secrets would not be divulged to the public; (4) the courts of the land would be relieved of a crushing burden of litigation; (5) less underhandedness would be attempted at the expense of the producer of coal because present evasions through the courts could not be practiced.

"It seems to me that there is a vital need for coal men to realize the fact that there is a trade evil that needs correction," said Mr. Gilroy. "That evil relates to the disputes that arise between you and the men that are purchasing the coal from you and that fail to make the proper payments, or set up fictitious defences against your just claims. Let me say that throughout the United States, in every line of industrial activity, we have found the same degree of dishonesty and unwillingness to pay just obligations that you are confronted with.

RUSE TO EVADE CONTRACT OBLIGATION

"Suppose you, separated by a great degree of space from the purchaser, ship your product, relying upon his honesty and character, only to find that when your commodity has reached its destination and has left your control, the purchaser seeks to evade the obligations of his contract and refuses to pay the agreed price. The refusal is based upon technicalities. Really it is an attempt to obtain the coal at a price below the contract obligation, and it succeeds in many instances because you, realizing the cost and ultimate loss of litigation, do not seek your just means of recompense. You know that the violation of a contract means that you are required to go into a court of law to place it before an unfriendly and, maybe, an ignorant jury, and in the end you receive a verdict that will not accord you justice and which will mean loss to you.

"The old jury system grew up in Anglo-Saxon times, when it was held that a man with any sort of litigation should place it before a jury of his equals—equals in trade and business. But today how is it? Men are selected from every avenue of business and industrial activity; men who are unfamiliar with you and your character and your business standing, and ignorant of the customs of the trade in which you are engaged. When the case is finally submitted there is a jumble of evidence from which they must select the truth. The judge, a man selected because of his superior knowledge of the law, but unfamiliar with your business, has charged them on the law of the case, and they retire and deliberate. They sit there, and in many instances draw lots to see which side shall be given the victory. And you are in many instances the victims.

"Then again litigation is the subject of deliberate delay. Delays by men who refuse to meet their just obligations and know that by appeal to court they can set back the day of reckoning until it suits them to settle or until they tire you out, and make you take a smaller amount of compensation than you are entitled to.

"While I say this condition is particularly pertinent to your industry it applies to every large industry in the United States. With a realization of this condition, gentlemen belonging to the New York Chamber of Commerce sought to devise a better system, a more ready means for determining business controversies, and they developed the 'New York Law of Arbitration.'

"Arbitration is not a new principle. It is recognized in every state in the Union. Any two men who have a controversy may submit it to an umpire under the law in the State of New York. But there was no means whereby a man could be compelled to submit to arbitration. When the decision was rendered there was no means to put it into effect. Parties refused to be bound by it. The Chamber of Commerce in New York agitated for several years to have a law placed on the statute books which would make controversies once submitted to arbitration binding upon both parties. That law was finally passed in 1920. Now, men who have differences in business and agree in writing to submit to arbitration are bound to do so and are bound by the decision which is made by the arbitrators.

SIMILAR LAWS INTRODUCED IN EVERY STATE

"The Arbitration Society of America was organized to give this publicity. Charles M. Schwab is the president. Others of similar character are officers. Since 1920 we have introduced into every state Legislature of the Union laws similar to this and we are going to keep on with our efforts until we are successful.

"The operation of this law in New York is as follows: Two of you coal men have a difference of opinion—legitimate in every way. You have different viewpoints. A difference arises. We have provided for every trade association that wants to adopt this system a clause by which the men who enter into that contract agree to submit every question in controversy to arbitrators selected by the parties themselves in a manner specified by the clause. Once signed, the contract is binding. Men cannot evade submitting their controversy to a tribunal thus selected.

"The result is as follows: You men, instead of setting your controversy before an ignorant jury and judge who is only familiar with the technique of the law, select your own judge and jury, men who will come from your own industry, who are familiar with every trade and trade custom that govern you. You pick your men and then instead of waiting, you fix your day for a hearing. You don't have to have your witnesses attending day after day in a vain attempt at being heard. Nor are they burdened by the technical rules of law. They are not confused by men legally trained. They can tell their story in their own way. The arbitrators will make their decision.

"EXPERTS" EASILY OBTAINABLE FOR EITHER SIDE

"In a court, to establish a trade custom before a jury you men have to call an expert (and you should know it is just as easy to employ experts on one side of a controversy as on the other) and the result is confusion. But the jury must decide the truth. It is a toss up the way most legitimate controversies are determined. In arbitration we don't have that. The arbitrators themselves select the leading men or the leading firms of the country, whose word upon trade customs could be received without question.

"Now a court of law is a public tribunal. The public is permitted to listen to all proceedings. In many instances men have business secrets which are sacred. Instead of publishing them before a jury in a court of law, you are able to have the testimony given without a violation, before an arbitration committee.

"It seems to me that associations composed of men who control the business of the coal industry should adopt a clause in every contract made with a jobber or retail dealer to the effect that any controversy will be submitted to arbitration by the rules of your organization. Then when a controversy does arise these men will be compelled to submit their differences to arbitration, and if they do not you can place them upon the list of discredited ones. You can circulate this list and you will all know with whom you can deal on a fair basis. You will cut your losses to a great extent."

Problems of Operating Men

Edited by
James T. Beard

Retimbering Old Slope to Open a Longwall Mine

Need of Providing Good Headroom on Main Slope—Double Timbering or Hitches Cut in Ribs Alike Inefficient—Support Crossbars on Cribs

SOME time ago an inquiry appeared in *Coal Age* regarding two methods attempted in the retimbering of an old slope for the purpose of opening a longwall mine in a 4-ft. coal seam. The roof being a frail soapstone had fallen to a considerable height requiring the lagging to be built up in the form of cribs above the timber-sets. The inquirer stated that in the first attempt, double timbering was used to support the lagging.

Finding that this first method was unsatisfactory, the plan was changed and the crossbars supported in hitches cut in the ribs, believing that the timber would then settle more uniformly with the strata than when double timbering was used as at the first. The sketch shown in the inquiry (Mar. 1, p. 380) indicated that the crossbars were set in below the roofline, which would give scant headroom for haulage on the main slope, in a 4-ft. seam, after deducting the necessary 6 or 8 in. for depth of the collarbeam.

Such a plan, would suggest the idea that very low cars were used in that case. However, in a later article, which appeared in the issue for May 10, p. 760, it was explained that the hitches supporting the collarbeams were cut in the solid formation, about 3 ft above the coal, and this would provide ample headroom on the haulage slope.

EFFECT OF PRESSURE IN LONGWALL WORK

The situation is not entirely clear regarding the proposed development of the longwall mine, after the slope has been put in suitable condition. If, as suggested in the reply to the inquiry, it is the intention to extend the longwall work above the foot of the slope and extract the coal on either side of that opening, to my mind, neither of the methods proposed will prove satisfactory for the support of the pressure that will undoubtedly be thrown on the slope as the work proceeds.

In my opinion, the roof weight due to the extraction of the coal, will develop crevices and breaks in the supporting pillars that will eventually let down the timbers and give no end of trouble if the crossbars are to be supported in hitches cut in the ribs. Or, if double timbering is employed as first suggested, the oncoming weight will break the posts and cause them to bulge into the roadway where they would be a constant menace to the safety of drivers and motormen.

At the best, either of these methods would require constant renewals in the timbering of the slope. Allow me to suggest, therefore, the adoption of a method that I have seen successfully employed under practically the

same conditions as those described in this instance. The plan was put in operation after other methods had been tried and failed. The increased first cost, I may say, is largely offset by the coal recovered from the ribs when the cribs or cogs are built.

As shown in the accompanying figure, which needs little explanation, substantial cribs are built on each side of the roadway. In order to make room for these cribs, skips from 4 to 6 ft. wide are taken along the rib on each side of the road. Owing to the soft nature of the roof, in this case, it will be necessary to build up the cribs shortly after the coal is taken out. To provide the required headroom over the track, in low coal, it will be necessary to cut channels in the soft formation

SUPPORTING TIMBERS ON CRIBS AT ROADSIDE

above the coal for the insertion of the ends of the collars, which should project well over the cogs, as indicated in the figure.

In the adoption of this method, the weight due to the extraction of the coal will be taken by the cogs and what breaks occur will be on the line of the ribs, inside of the cogs, and not on the edge of the roadway, as would result in either of the methods previously mentioned. What settlement of the roof takes place will be gradual if the cogs are well built.

In addition, the collarbeams being supported on the cogs will settle with them without breaking and most of the evils of the other method will be eliminated. It will be found that cost of maintenance of the road on the main slope will be relatively small and this, together with the extraction of the rib coal, will practically offset the expense of building the cogs.

L' INCONNU.

OTHER LETTERS

REFERRING to the best method of supporting the roof when retimbering a 500-ft. slope, 8 ft. wide, on a pitch of 20 deg., where the roof has fallen to a considerable height, and the timbers are badly broken because of the soft nature of the soapstone overlying the coal, *Coal Age*, March 1, p. 380, permit me to say, regarding the two methods suggested, that of double timbering has little to recommend its adoption under the conditions named.

The inquiry recalls an instance in my own personal experience where several roadways, under conditions

similar to these, were kept open with great difficulty. During a single weekend, the floor or bottom on these roads heaved so badly that the headroom was reduced from 5 ft. 6 in. on Friday night, to a scant 3 ft. on Monday morning.

The inquirer proposes to open up a longwall mine and haul the coal out through this old slope. From experience in longwall mining, I have always found it a good and safe plan, where the coal is sufficiently strong, to use heavy collarbeams, old rails or I-beams, hitched into the ribs, either in the coal itself or into the stratum overlying the coal.

ADVANTAGES IN USE OF RAILS OR I-BEAMS

Not only does this method afford increased headroom on the road and save the timber required for legs to support the collars; but a still greater advantage gained is the lesser liability to accident by reason of a derailed car or wreck knocking out the legs and causing a heavy fall of roof and much delay, to say nothing of the expense of cleaning up the entry and making the necessary repairs.

Where rails or I-beams are employed these can be readily taken out and used again when a road is abandoned. In my own experience, we have never failed to lose a single steel beam when abandoning a longwall section. If a beam was too tight to be readily loosened a small piece of dynamite, exploded at one end of the beam, quickly overcame the difficulty. The first cost of the steel is soon made up in the saving of labor and timber that would be required for constant renewals, as posts and collarbeams are broken. LONGWALL.

McKeesport, Pa.

PERMIT me to say that my experience in retimbering an old road, under conditions much like those described in the article entitled "Timbering High Falls On Entries," *Coal Age*, May 10, p. 760, has taught me that the safest plan to adopt is to hitch the crossbars into the ribs on either side of the entry, provided the coal is solid enough to support the bars.

In place of wooden bars for that purpose, I have found there is a great saving in the use of railroad iron weighing from 40 to 60 lb. per yd. For an 8-ft. entry, we have used these rails cut into 9-ft. lengths. A 6-in. hitch is cut in the rib on one side of the entry and a slant drivehole is made on the other side to permit the bar to be slipped into place.

ALTERNATE PLAN GIVES GOOD RESULTS

My practice has been to alternate these slant driveholes with the 6-in. square hitches cut in the two ribs, which I believe gives better results in putting up the bars. Should the coal be a little soft immediately under one end of a bar, a hitch can be cut lower down in the coal and a short leg inserted to hold that end of the bar.

Not only will steel crossbars last during the life of the mine, but they are able to withstand a greater side pressure than wood bars. This method of timbering gives a good clear roadway and avoids the risk of timbers being knocked out when cars are derailed.

Sullivan, Ind.

R. J. PICKETT.

IN DESCRIBING the retimbering of an old slope an inquirer some time since stated that the coal was overlaid with a frail soapstone roof that had fallen to a considerable height above the road. The thickness of the soapstone in that instance was not given. Some-

times, where the thickness of such material is not great, it may prove an advantage to take it down up to the solid formation in order to secure a good roof that is safe for the men to work under.

A soapstone roof on a haulage road, moreover, will almost invariably prove a nuisance, as the dropping of the loose material on the roadbed requires constant cleaning of the track and demands care and watchfulness on the part of the driver or triprunner to avoid accidents. In addition to this, there is the expense of the wages paid to timbermen and the cost of the material required to keep the road safe and in condition for haulage.

It is probable that, in the case here mentioned, the thickness of the soapstone is too great to permit of its being taken down and the only thing to be done is to adopt the best and most economical method for the support of the roof. In no case should long legs be used for supporting the crossbars on a main haulage road. Instead, my preference has always been to support the bars in hitches cut into ribs on each side of the entry where the coal is sufficiently hard.

SHORT LEGS HITCHED INTO RIBS SAFE PRACTICE

Every one familiar with mining practice knows that the derailment of cars is a matter of frequent occurrence in the haulage of coal underground; and timbers are almost sure to be knocked out when long legs are used. Even though this may not happen, the breaking of a coupling or cable may let one or more cars run down the slope with the same result. In that case, it is fortunate indeed if several sets of timbers are not torn out.

In many cases, the roof will be left in such a dangerous condition that nothing can be done to replace a derailed car on the track, until the roof is first made safe. In closing, let me say, by all means avoid the use of long legs when timbering a haulage road. Instead, hitch the crossbars into the ribs, as I have stated. At times, a short leg can be used hitched into the coal on one or on both sides of the entry. WILLIAM ALLAN.

Frontier, Wyo.

Mine Cave-in Depicted in a Moving Picture

Mining conditions and scenes not always successfully featured in a moving picture—Such attempts should be made under the supervision of mining men to appear realistic.

A SHORT time ago, through the columns of *Coal Age*, I commented on the incorrect featuring of a gas explosion, which was assumed to have occurred in a bituminous coal mine. In that instance, the picture shown on the screen was called "The Flame of Life," which probably appealed to the producer as an appropriate title for a picture depicting an explosion of gas in a mine.

Only recently another film has been unreel in a somewhat more successful attempt to bring before the popular gaze the scenes of a cave-in at an anthracite mine. This picture is entitled, "The Little Church Around the Corner," perhaps suggested by the fact that the story included a parson who assisted in the work of rescue following the disaster.

It is not my purpose to unnecessarily criticize the featuring of mining scenes and occurrences; but I want to say that these scenes would be far more realistic, if those in charge of the production had enlisted the

advice and assistance of coal mining men familiar with every detail and whose suggestions and assistance would add life to the picture.

In this second attempt to portray life in the mines, the story briefly told is that of a colliery owner who had persistently turned a deaf ear to the entreaties and warnings of the workers employed in the mine. They had protested that parts of the underground workings were unsafe. The development of the story showed that the inevitable happened with the result that a number of men were entrapped by a heavy roof fall that cut off their escape to the surface.

RESCUERS WEAR OLD TYPE OF HELMET

Among the rescuers was a parson, the thought of the producer probably being that his presence lent an added interest to the scene. While the rescuers were very properly equipped with flame safety lamps and carried a caged canary to betray the presence of poisonous gases, they all wore the old type of helmet, which is now no longer used in exploring mine workings.

However, finding that the canary was unaffected by any gas present, the rescuers promptly discarded their helmets and set to work to remove the fall behind which they hoped to find the men still alive. Happily, after much hard work, the rescuers broke through and the entrapped men were saved, though a few of them showed signs of being overcome for lack of air.

As I have intimated, the worst feature of this film production was the wearing of the old type of helmet by the rescuers. Also, the caving in of the underground workings was announced in the picture by a puff of white smoke that came from the mouth of the shaft and was supposed to represent dust; though a dense black cloud would have better described the occurrence. To the credit of the producer, it can be said, however, that the crowd of miners and their people appeared natural and a large coal breaker was filmed continually.

Longest Mine-Drainage Tunnel

Cripple Creek drainage tunnel not the longest—Surpassed in length by the Jeddo mine-drainage tunnel and branch, aggregating five miles in length.

REFERRING to the account of the Cripple Creek drainage tunnel, *Coal Age*, June 14, p. 980, given in response to an inquiry asking for the longest tunnel driven for drainage in mining districts and its location, it will be of interest to readers to know that the Jeddo drainage tunnel, in Luzerne County, Pa., is probably the longest tunnel driven for the drainage of mines in this country.

The Jeddo tunnel, known as the A. G. Markle & Co. project, was driven in 1893-1895 and extends from Little Nescopeck Creek to the valley of Big Black Creek, a distance of approximately $3\frac{1}{2}$ miles. From this main tunnel there was driven a lateral tunnel or branch extending $1\frac{1}{2}$ miles to the east. The main tunnel was driven 8x8 ft., in section for a certain distance and the balance of the way the section was changed to 7x11 ft. The length of the Cripple Creek drainage tunnel is stated as about 10,000 ft., or somewhat less than 2 miles, while the Jeddo drainage tunnel, together with its branch, aggregates 5 miles in length. As far as we know, this is the longest mine-drainage tunnel in the country.

Inquiries Of General Interest

Ascertaining Resistance Due to Bends in Airways

Recent Experiments Show Resistance of
Sharp Bends Is Considerable—Loss in Static
Pressure Measured by Modified Pitot Tube

MUCH has been said, lately, about the amount of the resistance offered by bends and angles in mine airways, and I have wondered how such resistance affects the coefficient of friction. Is the resistance due to a bend in an airway sufficient to have any appreciable effect on the power producing the circulation? Also, is the coefficient of friction the same in an airway having a number of sharp bends as in an airway that is straight, other things being equal? Kindly explain if there is any practical way of finding the amount of resistance offered by a sharp bend or angle, in an airway, and state how this is done.

Marissa, Ill.

GEORGE HOLMAN.

For some time past, the Engineering Department of the University of Illinois, in co-operation with the Federal Bureau of Mines, has been investigating what effect sharp bends and changes in the sectional area of airways, together with the form of timbering and other irregularities, may have on the actual pressure producing the circulation of air in those airways.

It has long been known that such obstructions to the flow of air, as those just mentioned, have more or less effect to increase the pressure required to circulate the air. It is only recently, however, that attempts have been made to measure the effect and determine to what extent the mine resistance is increased.

It will be readily understood that, in order to make these determinations of any value, it was necessary to employ special devices that would enable accurate measurements to be taken of the pressure on the air, before and after the current had passed the bend or other obstructions. The apparatus used for this purpose has been fully described in the issue of *Coal Age* for April 26, 1923, pages 669-674.

As there appears, use was made of small pressure boxes, airtight except for two small holes bored in each of the flat sides of the box for the purpose of registering the static pressure in the airway at the point where the box was placed. An airtight tube connected each pressure box with a special gage by which the pressure could be read to 0.001 inch.

In taking the observations at a sharp bend in the airway, two pressure boxes were placed, one outby and the other inby of the bend, and each box was connected by a rubber tube with the special gage for registering the respective pressures in the boxes. The difference in these pressures showed the loss of pressure due to the bend. When an airway makes a square turn of 90 deg., the theoretical loss in pressure is twice the velocity head, as calculated by the expression v^2/g . On the other hand, if the same turn through 90 deg. is made by a gradual curve the loss is almost inappreciable.

By way of illustration, suppose an air current having a velocity of 1,200 ft. per min., (20 ft. per sec.) strikes a sharp right-angle turn in the airway, the loss in pressure, expressed in inches of water gage, is 0.18 in. Assuming the mine is ventilated under a 2-in. water gage in the fan drift, such a right-angle turn in an air-course would mean a loss of $(0.18 \times 100) \div 2 = 9$ per cent of the pressure or the power producing the circulation. This is a very considerable loss and shows the

importance of avoiding such sharp bends in an air-course.

In regard to its effect on the coefficient of friction for the entire mine, no definite answer can be given to this question, as each obstruction is a debit item separate from the frictional resistance offered by the rubbing surface. For this reason, it cannot be understood to affect the coefficient of friction as that is generally understood.

Examination Questions Answered

Miscellaneous Questions

(Answered by Request)

QUESTION—If a mine makes 312.5 gal. of water per minute and has a sump that can hold 20 hr. of water, while the steam pump has a capacity that can empty the sump in 15 hr. if the supply is cut off, how long will the pump be in taking out the water, the sump being full and the supply constant? What will be the dimensions of the pump?

ANSWER—The capacity of the sump, in this case, is $20 \times 60 \times 312.5 = 375,000$ gal. A pump that can handle this quantity of water in 15 hr. must have a capacity of $375,000 \div (15 \times 60) = 416\frac{2}{3}$ gal per min. If the supply is constant the sump will be drained at the rate of $416\frac{2}{3} - 312\frac{1}{2} = 104\frac{1}{6}$ gal. per min. The time required to drain the sump, under these conditions, is $375,000 \div 104\frac{1}{6} = 3,600$ min., or 60 hr.

Then, assuming a piston speed of, say 100 ft. per min., the diameter of the water-end of a pump having a capacity of $416\frac{2}{3}$ gal. per min., is found by the formula.

$$d = 5.37 \sqrt{\frac{G}{S}} = 5.37 \sqrt{\frac{416\frac{2}{3}}{100}} = 10.96, \text{ say } 11 \text{ in.}$$

QUESTION—The total pressure on a steam piston is 100 short tons. If the diameter of this piston is 24 in., what is the pressure of steam per square inch?

ANSWER—The sectional area of a 24-in. piston is $0.7854 \times 24^2 = 452.39$ sq.in. For a total steam pressure of 100 short tons (200,000 lb.), the unit pressure of steam on the piston is $200,000 \div 452.39 = 442.1$ lb. per sq.in.

QUESTION—How should a safety lamp be treated when found to be full of flame, as the result of being in an explosive mixture?

ANSWER—Make no quick movement, but slowly and promptly lower the lamp toward the floor or remove it from the body of gas. In withdrawing from the place, screen the lamp as much as possible by hiding it under the coat.

QUESTION—We are using 2-in. pipes leading to nine sumps. We are going to gather our water into one sump and want to use one pipe to do the work. What size of pipe will be necessary to replace the nine 2-in. pipes?

ANSWER—Disregarding the possible unequal lengths of the pipes and assuming an equal head and length in every case, the quantity of flow varies as the square root of the fifth power of the diameter of the pipe. In

other words, for the same head and length of pipe, the diameter ratio is equal to the fifth root of the square of the quantity ratio. But, in this case, the flow in the single larger pipe must be nine times that in a single 2-in. pipe. Then, calling the required diameter x , the quantity ratio being 9, we have

$$x = 2 \sqrt[5]{9} = 2 \times 2.4 = 4.8, \text{ say } 5 \text{ in. } \sqrt[5]{9^2} = 2$$

QUESTION—(a) What are the advantages of high piston speed? (b) What are the disadvantages of high piston speed? (c) What is the effect of high piston speed on the rod packing?

ANSWER—(a) The advantage of high piston speed is the obtaining of greater power with a reduced space occupied by the engine.

(b) The disadvantage of high piston speed is the difficulty to properly balance the engine and avoid the racking strain on the movable parts, particularly the crank connections.

(c) The effect of high piston speed on the rod packing is to produce a greater wear on the packing, which will require more frequent renewals. This is owing to the greater distance of rod travel in the same time, and the packing sweeping over a larger area in that time, than with a lower piston speed.

QUESTION—What in your opinion is the best kind of boiler for use in coal mines, and why?

ANSWER—More recent coal-mining practice is to replace the return tubular boiler, formerly so largely used in coal-mining districts, by the safer and more economical water-tube boilers.

QUESTION—How may the water consumption of a boiler be calculated?

ANSWER—The evaporative power of a boiler depends on a number of things, such as the type of boiler employed, amount of heating surface, area of grate and whether forced or natural draft is used. Knowing the rated horsepower of the boiler, its water consumption may be found by multiplying the rated horsepower by 34.5 and dividing that result by the factor of evaporation, which must be taken from a table of feed-water temperatures and boiler pressures.

QUESTION—How can you prove the correctness of the steam gage and safety valve, on a boiler, by comparing them with each other?

ANSWER—First calculate the pressure on the valve at which the steam will start to blow off. To find this pressure, multiply the weight of the ball by its distance from the fulcrum of the lever and divide that product by the distance of the valve stem from the fulcrum, both of these distances being expressed in inches. The result will be the total pressure of the steam on the valve that will cause it to lift. Then, dividing this total pressure by the sectional area of the valve, expressed in square inches, will give the steam pressure, in pounds per square inch. This pressure should correspond to the reading of the steam gage, if both the gage and the safety valve are in good working order.

Mine Inspectors' Institute Advances Cause of Safety

Wants All Electrical Equipment Better Protected—
Discusses New Guards Against Explosions—Decides
to Revivify—Resents Bureau of Mines Interference

By E. W. DAVIDSON

Withering heat at Pittsburg, Kan., did not prevent the Mine Inspectors' Institute of America from making a little Institute history July 10 to 12. It stuck strictly to business for the entire three days of its fourteenth annual convention, engaged in some spark-striking discussion, developed several safety measures that may save lives and property, asserted itself for state's rights in the face of a Bureau of Mines gesture of domination, and started in vigorously to revive its own self to virility. It elected James Sherwood president and chose Cincinnati, Ohio, for its meeting place next year.

All of this action was taken in spite not only of consuming heat, which is well worth two mentions, but also despite the fact that the attendance was the smallest the institute ever had. The very thinness of the ranks stung the institute to action. "We've got to revive or quit," declared President Robert M. Lambie. The decision was to revive, and do it right away. So the constitution was rewritten to open the membership not only to all coal- and metal-mine inspectors of America but to every man engaged in mine safety work, whether for an insurance company or a mining concern, and to every man who professionally teaches mine safety. It set up a committee to lay out a plan for organizing district chapters to awaken interest and stimulate more safety thought, and will hereafter urge every Governor and every company to send inspectors and safety men to future meetings.

The bars were not lowered too far, however. Men declared with much candor that the institute is not to "degenerate into a thing run by grease and powder salesmen to drum up business." The institute's head is high and its aim is straight at a goal—making mines safe.

Much sound safety talk during the convention is expected to crystallize into safer practices in mines everywhere but the most concrete work of the convention displays itself in the main resolutions, which, summarized, follow:

(1) That every possible effort be made to safeguard the use of electricity in mine operations and to this end we would request the U. S. Bureau of Mines to make every possible effort to discover means whereby electrical equipment in mines will be made as safe as possible and that special attention be given to the proper installation and care of the electrical transmission lines in mines.

(2) That, whereas, in the July 5, 1923, issue of *Coal Age* reference is made to proposed safety inspections of mines by engineers from the mine-rescue cars of the U. S. Bureau of Mines, reports of such mine safety inspections to be made directly to the operator. Be it resolved that it is the sense of this meeting of the Mine Inspectors' Institute of America that such inspections, though undoubtedly made with the best of intentions, will seriously embarrass the state mine inspectors in their work unless the Chief Mine Inspector is notified so that he may arrange to make a joint inspection at the same time.

(3) That the chiefs of the various state departments of mines be requested to join together for the purpose of preparing uniform mining laws and that the governors of the various mining states be requested to send the various chiefs to a meeting called by the president of the Mine Inspectors' Institute of America for the purpose of preparing such uniform laws and to include the necessary funds for such revision in their various budgets.

(4) That the secretary write to all operators' associations at least sixty days before each meeting of the institute requesting them to send their men engaged in safety promotion work and use their influence to get governors to send state inspectors and that similar letters be sent to the officials of liability insurance companies carrying mining risks and to the director of the Bureau of Mines.

(5) That every state should extend safety inspection to cover every hazardous type of mining.

(6) That, since it has been brought to the attention of the institute that in one of the important coal fields, water is being applied by means of a pipe fitted to the cutter heads of mining machines, thereby eliminating the dangers arising from coal dust at the working face, it was resolved that the institute go on record as favoring the application of water wherever practicable possible, and further that "we believe the application of water during the operation of cutting is a safe, practicable method for the elimination of dangers of coal dust at the face of rooms and entries."

The full list of new officers chosen at the wind-up of the convention is: President, James Sherwood, of Kansas; First Vice-President, James Dalrymple, of Colorado; Second Vice-

President, Frank Hillman, of Alabama; Third Vice-President, E. J. Hoey, of Illinois; Secretary, Martin Bolt, of Illinois; Assistant Secretary, J. S. Rogers, of Kansas; Treasurer, Dr. J. J. Rutledge, of Maryland; Editor-in-chief, James T. Beard, of New York.

"A miner can't be a safe miner until he knows how and until the idea of intelligent caution is drilled into him as a second nature," the inspectors agreed. So the various educational movements throughout the country must be supported heartily and they must be expanded to cover the country. President Lambie remarked on this early in the session, saying that education is absolutely essential to safety and ought to be so recognized everywhere. In West Virginia the state classes for miners have already instructed 1,200 men of whom 800 have graduated. Summer school now has 87 getting safety training with technical mining instruction.

"Of course there is opposition among certain miners who fear they will be surpassed by men who take the courses," he said, "but the work should be done in spite of that."

Both Professors Yates and Abernathy, of the mining department at the Kansas State Teachers College, in Pittsburg, told of their own efforts to get more men from around Pittsburg into the special courses for miners and of their desire to expand the service of the school.

Pennsylvania is establishing evening schools for miners and the Department of Mines is taking an active interest in it, according to Joseph J. Walsh, secretary, in a letter to the convention. He said the courses are comprehensive but simple. It is expected that 10,000 mine workers will attend classes during the coming winter months. "These," said Mr. Walsh, "will be a potent factor in the intelligent operation of mines."

EFFORTS FOR SAFETY AND EDUCATION

"The Department is co-operating with anthracite operators and mine workers to devote two weeks to a safety and educational period," he wrote. "During the first week the mine officials will devote a greater part of their time to instructing their employees in everything that pertains to safety, giving particular attention to the new and unskilled miners. The first day probably will be devoted to instruction and advice regarding shaft accidents, the second day to accidents by falls, and so on. The second week will be a sort of general safety week, a program for which will be worked out by the operators. A similar program will be carried out in the bituminous region in a short time."

The inspectors said a good many pointed things about the dangers of electrical machinery in mines.

The old, old question of what to do about dust got wide-awake attention. Martin Bolt said dust always is so dangerous that there is not much use trying to determine how much there must be present to constitute a hazard. After each shot "bug dust" should be carefully loaded out and the place wet down before another shot is fired. Also adjacent places ought to be wet down well. But the trouble is a pile of dust cannot be rendered innocuous by sprinkling casually, for it will ride on top of the water. Loose coal dropped from cars should not merely be shoveled aside in haulageways, he thinks, for it so often rolls back on the tracks or under a mule's hoofs and is ground to dangerous dust.

The plight of the oil-harrassed coal fields around Pittsburg, Kan., was pictured to the convention at its Wednesday morning session by W. L. A. Johnson, commissioner for the Southwestern Interstate Coal Operators' Association. He said the output of Kansas, Oklahoma, Missouri,

Arkansas, Iowa and Texas was 30,000,000 tons a year in war time, but in 1922 it dropped to 5,500,000 tons and this year it would be about the same. He is doubtful whether coal can continue as an industry there unless a separate and lower wage scale can be obtained.

He believes in most careful coal-mine inspection by state inspectors but he hoped such men would not get overzealous to the point of compelling operators in such a stricken field as the Southwest to take extreme and unnecessary safety precautions which are expensive. He urged that they always temper authority with judgment.

Failure of union labor to co-operate with operators to make safety methods and devices successful blocks many commendable efforts by mine inspectors, he said. Then he cited the instance of the mine in which shotfiring devices were put. Miners insisted they be compensated whenever the new method failed to fire. Because a miner who wanted a full day at home with pay could so easily have cut a wire or otherwise caused his place to remain unshot, the operators refused the demand. The men struck six weeks at that mine against the life-saving shotfiring device and finally won. There is no telling how many lives have been wasted since the old method was reinstated.

Operators' efforts have helped materially to reduce accidents in West Virginia, retiring President Lambie told the convention. He cited the safety methods of such companies as the Davis Coal & Coke Co., the Consolidation Coal Co. and the United States Coal & Coke Co., winding up with statistics showing that although 394 men were killed out of 95,883 mining in the state in 1917, in 1920 the ratio was only 346 out of 124,576, which proves that fatal accidents are decreasing steadily. Mr. Lambie's report to the convention will appear later in *Coal Age* in more detail.

LAMBIE DECRIES BUREAU'S SAFETY ADVICE

The solid objection of the inspectors was registered against the recently announced plan of the Bureau of Mines to have its field men make safety recommendations direct to mine operators.

"It's an interference with states' rights," declared President Lambie. "The Bureau was created for research and scientific work and that alone. I have had much aid from it and I intend always to co-operate with it heartily, but this new rule is a first step toward nationalization, and I for one think the time to stop it is right now, before it grows."

Inspector Dalrymple of Colorado and others also took a stand with Mr. Lambie. There was much reminiscing of the days years ago when the bureau antagonized many state inspectors, especially in West Virginia and Colorado. It was suggested that the bureau "family" is not united for it, as evidenced by a statement definitely against it sent to the convention by J. W. Paul, chief engineer of the bureau, the retiring secretary of the institute. The general feeling, after the air had cleared, was that the bureau may be expected soon to recail the new order. However, the resolutions committee brought in a resolution condemning it.

Vigorous discussion followed on the introduction of the question, What effect does accident compensation have on accidents? Most of those present could not see where it had helped to reduce them. Chief Inspector Sherwood, of Kansas, advocated uniform laws in all states and an examination of all would-be miners with certification. Dr. Rutledge in brief sketched the good work done by the Bureau of Mines since its establishment.

Wednesday afternoon the institute motored around the Pittsburgh mining region. That evening at a dinner given by the Chamber of Commerce of Pittsburgh, nearly everybody spoke. C. F. Spender, head of the Pittsburgh & Midway Coal Mining Co., introduced the orators all the way down the line from F. W. Newman, president of the chamber, and President Lambie, of the institute, clear to the end of the table, where sat Frank Hillman, whom Lambie calls the "sheik of Alabam," always prolific of ideas and graceful phrases. Inspector Sullivan, of West Virginia, made a plea for better feeling between operators—"who form associations to protect themselves against each other"—and miners prone to suspect their employers. The two do not understand each other and never will until they honestly try to put friendliness into their business relations, he said.

Others who spoke were Martin Bolt, Dr. Rutledge, Professor Yates of the Pittsburgh Teachers College, and Mr. Ryan.

At the opening of the Thursday session, Acting Secretary Sullivan announced that sixteen new members had been received. J. E. Roberts, chief inspector of Missouri, and Frank G. Fenix, a zinc-mine inspector from that state, spoke briefly. Tolbert Henson, a Missouri lead-mine inspector, precipitated a discussion when he suggested the institute send a resolution to the Governor of Missouri favoring a tonnage tax on iron and sand to support inspection of those operations. A number of inspectors objected to direct taxation or fees for inspection, holding it should be supported by general funds. Mr. Hillman said there would be too much tendency "to give Jones \$2 worth of inspection if he pays that, and Smith \$4 worth if that is his tax." Mr. Dalrymple, however, declared a direct tax is the only way that enough can be raised to properly support inspection. The decision of the institute was that it believed that inspection should be complete in all states wherever men work under hazardous conditions. The feeling was that the institute should not express itself in state matters.

A new discussion of uniformity of mine laws broke loose when the resolutions committee, composed of Dr. J. J. Rutledge, Frank Hillman and Martin Bolt, reported the resolutions previously mentioned. One of the proposed resolutions, favored a drafting of uniform laws for all states, especially for coal mining, by a conference of state chief inspectors. Mr. Dalrymple said it was an impossibly big job besides raising too many delicate questions between states. He was for dropping the matter, at least until the U. S. Coal Commission reports. The Commission has made a considerable study of the matter.

However there was a good deal of insistence that a uniform method of reporting accidents be perfected and that the institute do its best to get such forms adopted. Mr. Sullivan wanted it done so as to aid the Bureau of Mines in compiling statistics and reporting them to the public. Mr. Bolt remarked that the bureau asks from states only the number and causes of accidents and that not much uniformity is needed for that. He doubted whether inspectors' reports to state departments could be made uniform because of the wide variation in conditions between states. Mr. Dalrymple added that it is impossible to draw up this year a uniform blank covering everything that may develop next. Therefore there must always be room for "other conditions," such as is provided in Colorado blanks.

Before the institute passed its resolution urging that electrical equipment in mines be made safer Mr. Dalrymple campaigned to get the inspectors declare they would sanction the use of no electrical equipment whatever that did not bear the Bureau of Mines plate. But Dr. Rutledge, Mr. Hillman and others insisted that such a thing would put so much work on the bureau that it could not be done. The electrical section now approves only machines and switches.

"It can be done," declared Mr. Dalrymple, "and some day it will be done. The sooner we start, the quicker we'll reach that time. I want this institute to show the bureau and the world that it is behind the bureau to the fullest extent, and this would be one way to back it up in a great work."

Mr. Bolt and others counselled that the bureau merely be urged to study and bring out the weaknesses of electrical equipment, believing the manufacturers will voluntarily make many important remedies. Then the resolution, much tempered from the original proposal, was adopted.

Near the close of the convention a message of greeting was sent to J. W. Paul, retiring from the secretaryship after a service of fourteen years from the organization of the institute, conveying to him the institute's good will. Another went to J. T. Beard, Associate Editor of *Coal Age*, whose effort to resign from the editorship of the institute was fruitless.

Then a committee composed of E. J. Hoey (chairman), James Dalrymple and R. M. Lambie was appointed to work out a method of organizing district chapters of the institute and report at the next meeting in Cincinnati, Ohio, the second Tuesday in May, 1924. Points brought out in the discussions will be given in more detail in *Coal Age* next week.

Commerce Commission Orders Investigation Of Anthracite Rates

Apparently the Interstate Commerce Commission is disposed to go to the full limit of its powers to assist in stabilizing the coal industry. This is indicated by the prompt action it took in ordering an investigation of anthracite freight rates. The order was issued the day following the appearance of the report of the U. S. Coal Commission, in which such a recommendation was made.

There are some who believe that the decision in the assigned-car case was expedited by the Commerce Commission before the Coal Commission could have any opportunity to lay the responsibility at its door for the evils growing out of a practice which the Commerce Commission had approved.

The carriers have made formal application to the Commerce Commission for a rehearing in the assigned-car case. This follows a meeting of railroad executives in Washington on July 10, at which it was decided to take that action. If the Commerce Commission does not believe a rehearing justified, it is asked to allow the carriers to present additional arguments. In case that request is not granted, the carriers then suggest that the Commerce Commission give further attention to the situation of carriers purchasing for substantial periods the total output of mines and the situation of carriers owning their own mines and using the output thereof solely for railroad fuel.

This action on the part of the carriers is characterized in some quarters as being puerile. Attorneys for the carriers sat through the hearings, and because they regarded it as good tactics they made no defense of their position. They played poker, as one traffic man puts it; took a chance and lost. They did not expect to lose, so now they come back and want to put into the record what they deliberately left out for strategic reasons.

While all of the carriers will be a party to action on the part of the American Railroad Association, it is understood to have been the attitude of the Pennsylvania company that it would have been better to try out a plan of fueling without resort to the assigned car. Certain of the lines, it is understood, already have promulgated rules in conformity with the assigned-car decision.

Anthracite Wage Conference in Abeyance; 35 Demands Made, Says Warriner

Negotiations at Atlantic City between the anthracite mine workers and operators was suspended this week while the representatives of the miners attend the convention of District No. 1 at Wilkes-Barre and the installation as district president of Rinaldo Cappellini, who defeated William Brennan in the June election.

Several conferences were held last week by the subcommittee of eight that is considering the miners' demands. So far the miners have refused to consider an agreement binding them to remain at work after Sept. 1 if a new contract is not written in the meantime. Miners are forcing to the front their demand for the check-off. On July 10 Mr. Warriner issued the following statement:

"The position of the anthracite operators with regard to the wage negotiations is this:

"Actually the miners have presented thirty-five demands for changes in wages and working conditions, and not eleven, as would at first glance appear. Many of these demands involve the consideration of economic and technical details which will consume considerable time.

"Past experience has demonstrated that an anthracite wage contract cannot be negotiated in a hurry. While there is no disposition on the part of the operators to prolong unduly the negotiations, our action in appointing two alternate members of the subcommittee in order that there may be uninterrupted discussions is an indication of our anxiety to complete the work at the earliest possible moment. We realize that there is a possibility that a new contract may not be completed before the present one expires on Aug. 31. It must be borne in mind that only about seven weeks intervene between now and the end of August.

MINE WORKERS' REPRESENTATIVES ON ANTHRACITE SCALE COMMITTEE

Left to right: Thomas Kennedy, president of District 7, Hazleton; C. J. Golden, president of District 9, Shamokin; William Brennan, retiring president of District 1, Scranton, who was defeated for re-election by Rinaldo Cappellini.

"It was with all of the facts in mind that the operators both in the meeting of the full joint scale committee yesterday and in subcommittee today sought to obtain from the miners an agreement that there should be no suspension of mining operations after Aug. 31 in case the wage negotiations extend beyond that date. We proposed such an agreement for the main purpose of allaying public apprehension of a recurrence of the lamentable conditions of last winter."

The mine workers were somewhat taken back on July 1st when they were cross-examined by the operators on the subcommittee about the working of the check-off. They were asked to state specifically the wording of the contract clause to apply it in the anthracite region and to relate how it worked in the soft-coal fields. The miners replied, it is reported, that they would propose the standard clause that is being used in the soft-coal contracts, which they said had been "eminently satisfactory to both parties."

Adjournment was taken at midnight on June 12 until June 23 at Atlantic City.

Mine Bureau Engineers on Tour by Truck to Test Anthracite from New England Yards

In order to discover the amount of ash in anthracite as actually delivered to the consumer, the U. S. Bureau of Mines has sent into the field two engineers with a truck arranged for reducing coal samples which will be labeled and analyzed at the Pittsburgh testing station of the bureau. Results of these tests will be published by the bureau at the end of the season, which will be when cold weather arrives. Neither the names of the dealers from whom the samples are obtained nor the names of the shipping mines will be published, but the report will make known the towns in which the samples were obtained, the type of coal and the results of the analyses.

This move represents the first effort to obtain definite data regarding the qualities of coal delivered to consumers. Tests have been made, and still are made, of coal, both anthracite and bituminous, delivered to governmental departments in Washington, and last winter, under instructions of the Senate, the Bureau of Mines conducted tests of anthracite from the yards of retail dealers in Washington, but these tests did not afford the opportunity to obtain a cross-section view of the subject such as may be obtained by itinerate sampling.

In all the talk in recent months about "dirty coal" there has been what is described as a "surprising" lack of definite figures either as to the amount of ash that is and to be expected or the amount that is actually contained in coal which is complained of as "too dirty for use."

Officials of the Bureau of Mines long have had in mind plans to send engineers into the field to discover definite information regarding coal quality as the fuel is delivered to the consumers. O. P. Hood, chief mechanical engineer of

the bureau, planned his estimates of expenditures for the fiscal year 1924 to include some work along this line, these estimates were approved by the director and the appropriation passed by Congress last winter included a sum for this purpose which made it possible to start the work when the appropriation became available July 1.

After a special course of training in Washington, the two engineers, Charles W. Jeffers, Jr., and George R. Cooley, left July 9 and drove directly to Boston.

Massachusetts was selected for the first tests some months ago and the fact that the work is being inaugurated there has no connection with the enactment of an "unfit coal" law by the Legislature of that state. The tests will be conducted from the national standpoint and while the co-operation of state and local authorities will be welcomed, there will be no connection between the tests conducted by the Bureau of Mines and any other tests.

The co-operation of local dealers will be essential to the success of the tests in any locality. The tests will be thorough, according to the standards of the Bureau of Mines and of the American Society for Testing Materials. Donation of 1,000 lb. of anthracite will be necessary for each test. Preferably, samples will be taken from coal being loaded for actual delivery. The samples will be crushed in the machine carried in the truck for that purpose, and a quantity of the crushed material will be sealed in a can and sent to the Pittsburgh station for analysis.

If the work in Massachusetts is concluded before cold weather arrives, the engineers will go into Connecticut, and thence, if time permits, into other New England states.

There have been numerous requests to the Bureau of Mines for similar tests of bituminous coal, in other sections of the country, but the appropriation available is so small that only the one truck could be sent out and work in the anthracite-consuming region was decided upon first.

There is no official standard of the percentage of ash permissible in anthracite. By tacit understanding in the industry, product with less than 40 per cent ash is considered coal, that with 40 to 60 per cent ash is described as bone and that with from 60 to 100 per cent ash is described as slate. Tolerances in sizes make it difficult to calculate without a test the exact ash content of a shipment of a given class of anthracite.

Coal Commission Anthracite Report Elicits Little Enthusiasm in Middle West

It cannot be honestly said that the U. S. Coal Commission's anthracite report caused any great satisfaction among Midwestern operators. As a matter of fact it did not even stir up lively interest. There was general approval of the commission's stand against nationalism but the commonest comment was that the report contained "no kick," and that while the Commission's intentions evidently were good, it devoted a good deal of space to things said for political effect and did not bring out much that is new.

In Chicago it is often remarked that the Commission's proposal that costs and profits be made public by some governmental agency may not mean much because it would be so easy for unscrupulous operators to juggle their figures. Also it would be easy for the governmental agency to misrepresent and misconstrue coal statistics. Nobody takes very seriously the suggestion that the President take over mines and operate them in case of impending strikes. They hark back to the parlous days of last year when the President threatened to do that very thing only to recede from his stern position, and wonder by what specific plan the Commission would empower him to do it in the next emergency.

The feeling among St. Louis operators is not different from that in Chicago. There is not enough of practical benefit in the report and too much said for political effect. There are smiles over the proposal that the President operate mines to prevent coal stoppage by strike. The President must have more authority than he has now to do that with any effect. Also there is disapproval of the plan to collect and compile figures on coal costs, not because the average St. Louis operator fears to reveal the truth about the coal industry where such revelations may benefit the indus-

try but because there is too great a likelihood of those statistics falling into unfair and unintelligent hands.

One prominent operator, however, sees, besides the Commission's stand against nationalism of the mines, one other outstanding virtue in the anthracite report. That is the obvious desire on the Commission's part to set the public right on the matter of profits. The report's mention of 12c. on the dollar divided between producer and seller, instead of the "fabulous" profits usually credited to "coal barons" in the public mind, is having a good moral effect, this operator thinks. His belief in the good intention of the Commission on this point is supported, he says, by the Commission's latest request to bituminous operators for exhaustive statistics on revenue and coal profits since 1913. The truth about the lean years between 1913 and the present will prove that in the long run the coal operator makes no great profit. The average investigators are never fair enough to allow so long a view to be taken but make their decision on high years, when the operator is recouping previous losses.

In the Southwest operators have little to say about the anthracite report. The general feeling of hopelessness in that oil-stricken field is that although the Commission's recommendations for anthracite if applied to bituminous would not promise much benefit, yet anything might be better than present conditions.

The keenest interest a Rocky Mountain coal company official took was in the Commission's remarks about labor. Said he: "I certainly hope the Commission soon backs up its belief in labor living up to contracts by proposing something effective to bring this about. Of course, incorporation of unions would help, but probably something else is necessary." He was hopeful that the Commission had a "something else."

Mines of Crow's Nest Pass Work Under Handicaps, Says Coal Company Head

There is more discouragement than usual among the coal operators in the Crow's Nest Pass district of Canada, judging by remarks made by W. R. Wilson, president of the Crow's Nest Pass Coal Co., in his report at the annual company meeting in June. High wages, which were continued for one year after the strike, and "correspondingly high cost of production is creating a new set of adverse and discouraging conditions for this district in particular," said he, "for through the high cost of coal the railroads upon which this company in particular largely depended for the economic continuity, are displacing coal by oil, after patiently waiting for two years to see coal prices return to normal. In addition to this, smelters are prevented from accepting the lower grade ores because of the abnormally high prices of coke due to the high wages.

"When wages are increased in this district, the cost of production becomes magnified over and above the cost in fields operating under more favorable physical conditions, such as greater uniformity of structural coal bedding, better overlapping roof and greater freedom from dangerous gas generation."

Utilities Consume 2,943,242 Tons of Coal in May; Slight Gain in Power Produced

Electric public-utility plants consumed 2,943,242 net tons of coal during May, according to a report just issued by the U. S. Geological Survey. This compares with 2,967,707 tons consumed during April, according to corrected returns.

Fuel oil consumed by public-utility plants in May totaled 999,705 barrels, compared with 980,684 barrels in April. The average daily production of electricity by public-utility power plants during May was 149,400,000 kw.-hr., a slight increase over the rate for April.

The average daily production of electricity for the first five months of 1923 and the proportion produced by water power were as follows: January, 153,300,000 kw.-hr., 34 per cent; February, 154,400,000 kw.-hr., 33.9 per cent; March, 152,500,000 kw.-hr., 36.3 per cent; April, 149,100,000 kw.-hr., 39.9 per cent, and May, 149,400,000 kw.-hr., 41.1 per cent.

Emergency Federal Operation Feature of Anthracite Report Jars Operators and Mine Workers

BY PAUL WOOTON
Washington Correspondent of *Coal Age*

The storm center of the anthracite report of the U. S. Coal Commission is the recommendation that the President be authorized to declare a national emergency in case of a deadlock between operators and mine workers and be empowered to take over operation of the mines and distribution and marketing of the product. The operators fear that this would prove to be nationalization's entering wedge. Labor objects to it because there at least would be the coercion of public opinion brought to bear to make men work against their will. The public, however, seems to regard the measure with favor, not that it is anxious to see the government undertake any business activity but because it believes the industry will avoid any invoking of the emergency powers and with that alternative hanging over them will reach an agreement.

The recommendation of the Coal Commission in regard to emergency powers simply brings to the fore one of the big issues in our national life, it is pointed out. It has been recognized with increasing appreciation that some means must be found to break a deadlock between employer and employee when the continuance of that deadlock seriously affects the public welfare. The fact that the Coal Commission has made a concrete suggestion for the handling of such a situation insures the consideration of that and alternate plans at the forthcoming session of Congress.

The fact that the Commission has endorsed, in effect, a combination of big business interests, under suitable regulation, throws into the congressional arena another highly controverted problem of our industrial life. It has been popular in Congress for many years to lambaste any large business enterprise on the assumption that being big is *prima facie* evidence of its predatory character. Opinion, even in Congress, is changing to the point where the efficiencies of big business and the various benefits to the public of combinations are becoming apparent. It is true that the Coal Commission admits the possibilities of unjustifiable profits on the part of the anthracite combination, but on the whole its report shows that it was not afraid to commend it despite the fact that it is big.

COMMISSION SEES MALICE IN DAUGHERTY CHARGE

The other outstanding feature of the situation is the furor created by the published statement that the Attorney General influenced the report of the Commission. Members of the Coal Commission denounce the statement as having been made out of whole cloth. No one acquainted with the Commission's membership would believe for a minute that they would brook any political interference with their findings. The difficulty is that there is a large number of persons within the coal industry more than anxious to believe the tale. In addition there is a portion of the public always willing to believe a story of sinister motive. It is admitted that the allegation has carried further than most untruthful statements. For that reason it will not be surprising if the Commission should take rather drastic and unusual methods to establish the untruthful and malicious character of this charge.

It just happens that there is clear-cut evidence to show that the Attorney General did not exert the influence attributed to him. To start with, Mr. Daugherty left Washington on June 22 and was not again in the Capital during the period prior to the issuance of the Coal Commission's report. The report itself was not written until July 4. The final revisions were not made until July 6. The cutting of the first stencils, and the only stencils of the report ever cut, was begun at 11 a.m. on July 4. No proofs were read by anyone other than members of the Commission, and then only on July 6. The stencils were completed and read at 10:30 p.m. on July 6. No stencils were destroyed prior to July 6. On that date it was necessary to recut two of

them. In one case it was necessary to correct a bad typographical error and in the other there was a single verbal change which made it desirable to recut the sheet.

In some quarters the report of the Coal Commission is criticised for not having made clearer that there was no intention to reflect upon the integrity of the anthracite-producing companies in their comment on the limited natural monopoly. The fact that the nation's deposits of anthracite are limited is not chargeable to the operators. They would be subject to criticism had they combined to restrict output or to manipulate price, but the report makes no such charges.

Another criticism of the report is that the Commission sidestepped an important point when it stated that the determination of margins and profits is a judicial function. Before any definite conclusions can be drawn, it is contended, as to whether or not there has been profiteering, there must be a determination as to whether the properties are to be valued on their original cost, on the income-tax basis or on present value.

GOVERNMENT SHOULD KNOW WHAT GOES ON

The report reveals that the Commission believes the public is entitled to sit as an observer in the affairs of business. It is something like the position of the administration toward European affairs. Mr. Harding does not believe the nation should accept any of the responsibilities of the reparations commission, but he has a decided opinion that the United States is entitled to know what the Commission is doing. The Coal Commission is determined in its belief that the government should stay out of the coal business, but it believes it should know what is going on in that industry.

There are some engaged in the coal business who believe it would show the proper spirit were the industry to subscribe to some such sentiment as this: "We accept the main idea of the report that the public, through the government, is entitled to know what we are doing. We are gratified to know that the public wants us to continue the conduct of this business. We think we can handle it better than anyone else. We agree with the Commission that we have a responsibility in providing uninterrupted service. We are going to furnish that service to the fullest extent that the United Mine Workers will let us."

The anthracite report brings out with great clearness the change in the public's attitude toward big business. For twenty years the majority apparently has favored the separation of business activities into as small units as possible with the idea of exciting the maximum amount of competition and has acted on the assumption that there is inherent danger in big business. Chief Justice Taft when President, took a determined stand against any such general condemnation. He pointed out that big business has a great capacity for public service. The Taft policy has been accentuated and put into practice by Mr. Hoover in his capacity as Secretary of Commerce.

In the meantime the public has had an opportunity to observe and form some conclusions of its own. Now comes the Coal Commission, believed to reflect the opinion of the majority, with an endorsement of big business provided a certain amount of harness can be used. It is the Commission's plan to call industry in and frankly put large responsibilities on it. Industry has shown that it is responsive to trust to a remarkable degree, whereas, humanly enough, it does not do so well when threatened and treated unfairly. All of the Commission's recommendations for changed conditions are along lines of industry's working out its own way of serving the public. Each time a choice was open to the Commission between accomplishing its purpose by an act of Congress or by voluntary co-operation within the industry, it chose the latter.

Production and the Market

Weekly Review

The mines are grinding out a steady flow of 10,500,000 tons of soft coal with little or no effort and around two million tons of hard coal a week with considerable effort. Buyers of hard coal—that is, the retail dealers and householders—are wondering why all this push and fervor of the “buy-your-coal-now” movement that is coming from Washington, when they can’t get the coal they ordered six weeks ago. What the railroads and the officials at Washington are talking about, however, is soft coal, and what they are endeavoring to do is to get the country to take in during the summer months and put on the ground around their manufacturing plants and railroad yards a part of the soft coal that they will need next winter. The railroads say that they will be so busy hauling farm products next autumn that they will have to shove soft coal off the rails for a while and they do not want the operators to be crying “car shortage” at them as the price goes up. Buying of anthracite for household is ahead of production and this market needs no urging.

There has been a perceptible decline in soft-coal consumption following the slowing up of operations in iron and steel and textile industries. Railroads, public utilities and industries continue to add to their reserve stocks and there is much quiet buying of spot coal. Prices are fluctuating from week to week but on the average they are maintaining a fairly uniform level. *Coal Age* Index gained one point last week, an increase in the average price of 2c. per ton, raising the index to 198 on July 16. Of fourteen coals entering into this average, eight showed gains of from one to 13c.; and two dropped in price, while the remainder held firm.

PRODUCTION ON REBOUND AFTER HOLIDAYS

Production of bituminous coal during the week ended July 7 was affected by the holiday and the day following to such an extent that for the first time in several weeks it fell below 10,000,000 net tons. Estimates of the Geological Survey place total production for the

week at 8,763,000 net tons, while early returns on car loadings for the present week indicate that the total output for the week will be in the neighborhood of 10,500,000 net tons. Anthracite production during the same week was about three-quarters of that for recent weeks. Revised estimates show that anthracite output during June was 8,665,000 net tons, which was exceeded only in the corresponding month of 1917 and 1918, which were years of large washery output. The cumulative output for the first six months of 1923 stands at 51,169,000 tons, larger than for any corresponding period of the last eight years.

Trading in the Middle West is slow. There is no demand and “no bills” seem to be the rule at nearly all mines. Along the Atlantic seaboard buying is slow.

There is no demand for spot coal but high-grade coals on contract are moving well. In New England stocks are large as compared with other seasons and buyers are hard to find.

The export market improved slightly last week. There were some inquiries for definite orders, most of the coal going to Dutch ports. A couple of inquiries also were reported from South American points. During the first week in July 60,655 tons of cargo and bunker coal left Baltimore, as compared with 93,846 tons in the last week in June.

(a) Subject to revision. (b) Revised from last report

In some sections the movement of domestic sizes of anthracite is easier, but the demand continues strong. Consumers are watching developments in the anthracite situation and are urging deliveries from the retail dealers.

There were dumped for all accounts at Hampton Roads during the week ended July 12, 348,130 net tons of coal, as compared with 333,870 net tons during the previous week.

Chicago Market Is Low

Coal trading in the Chicago market remained low all week. So little domestic coal is moving out of any Illinois or Indiana field, however, that the ever recurrent hope that screenings would stiffen in price because of scarcity continued to be felt. However enough cheap screenings from Kentucky came into the Midwest market to prevent any noticeable price rise.

Stern efforts are being made by several smokeless shippers to prevent the recent 75c. cut made by one company on mine-run from spreading over the whole market. The result is that smokeless mine-run is selling all the way

from \$3 up to an occasional car at \$4, which was the former circular. There is little trading at best.

The movement of domestic sizes in the Carterville field of Williamson and Franklin County has almost stopped. Every mine has "no bills" and there seems to be no immediate prospect of moving them. Prices do not seem to be a factor. There just isn't the demand. There has been a let-up in railroad buying. Somewhat similar conditions prevail in the DuQuoin and east Jackson County field, excepting that the prices are far below those of the association operators in the Carterville district. In the Mt. Olive district things are practically at a standstill. A little railroad coal on contract is moving out, but there is no domestic tonnage moving and no steam sizes to offer.

In the Standard field the only demand is for screenings but this is very light. Railroad tonnage has been good in this district, but is easing up.

Nothing Doing in St. Louis

Hot weather has practically put an end to the delivery of coal except a little hard coal, smokeless and coke. A little apartment coal and some school coal is going in, but that is all. Wagonload steam is quiet and carload is notice-

Coal Age Index of Spot Prices Bituminous Coal F.O.B. Mines

	1923		1922	
	July 16	July 9	July 2	July 17
Index.....	198	197	203	321
Weighted average price.....	\$2.40	\$2.38	\$2.46	\$3.89

This diagram shows the relative, not the actual, prices on four-teen coals, representative of nearly 90 per cent of the bituminous output of the United States weighted first with respect to the proportions each of slack, prepared and run-of-mine normally shipped, and second, with respect to the tonnage of each normally produced. The average thus obtained was compared with the average for the twelve months ended June, 1914, as 100, after the manner adopted in the report on "Prices of Coal and Coke, 1913, 1918," published by the Geological Survey and the War Industries Board.

able only occasionally, with a call for screenings. Country domestic business shows a little activity, but it is not general. Country steam has almost dropped off.

Kentucky Ships Some

With all fields open and car supply good, with no strikes or other influences to hold down production or slow up delivery, it must be admitted that there is a lot of coal moving, in spite of the gloomy reports put out by operators and jobbers. Producers are keeping quality up. Both domestic and screenings are moving but mine-run is flat.

The western Kentucky field is moving some coal North and Northwest and into Michigan. Screenings are slightly stiffer than they have been. A better demand is needed in Kentucky and Tennessee, where there appears to be a backward buying feeling. Industrial demand is fair but stocking is light.

Duluth Demand Is Light

Demand for commercial bituminous coal on the Duluth market continues dull with consumers ordering for immediate needs only. Prices are irregular with further cuts being made in screenings in the effort to book business.

Around Minneapolis there is little trading. Both dock

and rail agencies are getting ready for one of the sharpest fights of years when demand finally wakes up. Just now the market is so demoralized it is difficult to name a going price on anything.

In Milwaukee the market is fair considering the season. Dock storage is rapidly filling, but there remains plenty of room for more anthracite. Movement inland is slow. Prices remain unchanged.

The strenuous efforts of Kansas City agencies to push coal storage thus far have produced no results. People will not buy. Perhaps the elaborate advertising campaign of the coal producers has not run long enough to show results. In Colorado, however, storage is picking up a bit following Federal Fuel Distributor Wadleigh's "buy-now" advice.

Reaction for Better in Central Ohio

A slight reaction took place in the central Ohio market during the past week and buying is more active. This is due in part to the tendency shown by some of the larger steam users to come into the market. Distress coal is being cleaned up and buyers are taking in coal to meet current requirements. Household users are not coming into the market as it was expected that they would, with the result that retail dealers are heavily stocked. Buying by railroads and utilities is the best feature. Distress coal has been increasing in volume in the Cincinnati market, and it has been difficult to move good coals, even at the low prices quoted. West Virginia 2-in. lump is quoted at \$2.50@\$2.75, no change from last week, and southeastern Kentucky 2-in. lump at \$2.50 as compared with \$2.50@\$3. The coal trade in and around Cleveland continues dull. Demand for steam coals is at a standstill, the majority of users buying bargain coal as they need it.

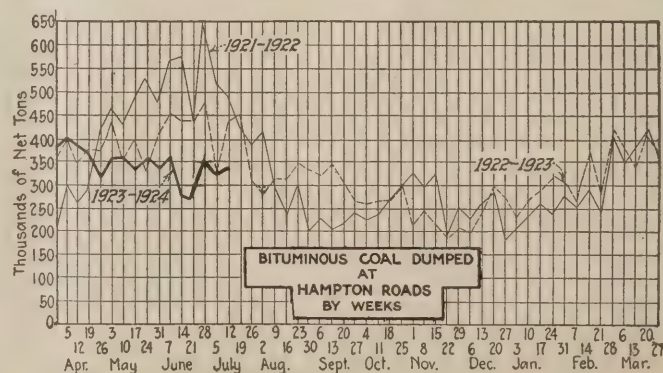

Pittsburgh Steel Mills Curtail Buying

Steel plants in the Pittsburgh district are buying less gas coal, the mills being very conservative in making commitments on any materials, as they are operating at lower rates and may have further declines in operation in the next few weeks. Operators are divided in their opinion of the situation. One batch of operators claim to be doing a good business while another batch say they have given up and are closing their mines, being tired of operating at a loss. The market at Buffalo is flat. Accumulation of coal is large and there are no indications of increased buying in the near future.

Indifference Reigns in New England

The market in New England shows little sign of recovery. Stocks are large as compared with other seasons and buyers are extremely hard to find. There is almost an utter lack of interest on the part of consumers throughout the territory and receipts both all-rail and by water are steadily dwindling. A few market cargoes put in an appearance and it is rumored that some extremely low prices were made to avoid vessel demurrage. Most larger buyers have not been attracted by these, purely because of the large reserves already accumulated, and there seems slight prospect of better inquiry before September.

Coals from the Pennsylvania districts are now less heard from. Prices on cars for Pocahontas and New River rule

so low, relatively, that except in the section west of Worcester there is only a very light tonnage being placed. Even deliveries on contract have been curtailed; the textile mills in particular have had so discouraging a prospect on finished goods that their consumption of fuel is much less than expected. Movement of high volatiles as well as steam coals via Philadelphia and New York for transshipment by water also has fallen off materially. Quotations generally are not any lower, except on distress coal, the operators having apparently in each case fixed upon an irreducible minimum.

Hampton Roads grades seem to be marking time. Producers of No. 1 navy standard coals have curtailed in the most drastic fashion; to such extent is this true that certain agencies when called upon for spot delivery find themselves in no position to respond.

For delivery inland from Boston, Providence, and Portland prices range from \$6.75@ \$7.25 per gross ton, although the former is more nearly the market level in trade that may be considered at all competitive. A few distributors who felt obliged early in the season to guarantee against a declining market are finding their contractors in a mood to insist upon adjustments in view of insistent soliciting for offers on cargoes either arrived or on passage. Among the market cargoes in process of being forced upon reluctant buyers are those in barges from Philadelphia, where the coal was dumped to avoid heavy car demurrage.

Dullness Pervades Seaboard Market

The market at New York and along the Eastern seaboard is dull with most quotations showing a decline from last week. Distress coal in the New York harbor has been nearly cleaned up, some of it having been let go at extremely low prices. Buyers for the most part are buying from hand to mouth. The bulk of sales in the Philadelphia market are being made at current quotations, with contract coals moving well. Domestic sizes of bituminous coal are being taken in by consumers who have been converted to its use during the last few winters, but this is not a large factor in the trade. Inquiry is increasing in Baltimore, mostly from interests which usually stock up in part or in full during the summer months but who this year have failed to take more than thirty or sixty days' requirements. There is little doing in the Birmingham market. Inquiry is limited and buyers are purchasing for immediate wants only. Orders for bunker coal are scarce. Domestic demand is easy, but the higher grades are moving fairly well. Production for the week ended June 30 was 364,000 tons, an increase over previous weeks.

There were 463,700 tons of anthracite sent out from Buffalo during June, making the Lake dumpings for the season 1,926,729 tons. Bituminous stocks on the docks at Duluth as of July 12 were estimated at 3,185,000 and of anthracite 228,000 tons. At Milwaukee receipts thus far during July have been 65,700 tons of anthracite and 212,559 tons of soft coal, making the total for the present season 357,219 tons of anthracite and 1,307,410 tons of bituminous coal.

During the week ended July 16 1,012,064 net tons of cargo coal and 58,611 net tons of fuel coal was dumped at Lake Erie ports, making the total dumpings for the season 12,361,332 tons.

Anthracite Consumers Urge Deliveries

Consumers of domestic sizes of anthracite continue to watch developments. Heeding the warnings sent out from Washington, they are urging retail dealers for deliveries. Quotations for independent domestic coals continue as high as \$12 in some instances, most of the high-priced coal being taken by inland dealers, while dealers receiving their coal by means of tidewater shipments are not inclined to pay the extremely high prices.

In the New York retail market egg coal is the shortest and some dealers have been able to accumulate small stocks of stove coal. In Philadelphia, as in practically every other district, no retail dealer is willing to admit that he is receiving sufficient coal to meet the demands of his customers. The hard coal situation at Baltimore is far from being comfortable to consumers. Few of the dealers have any stocks on hand and are far behind in deliveries. During June 1,110 cars of anthracite were shipped to Baltimore as compared with 1,455 cars received in May. During the first half of July 264 cars were reported as having been received. Retail dealers in Toronto are kept busy filling orders for anthracite, which has for some time retained its price of \$15.50 a ton. Supplies are fairly plentiful. Anthracite is going into Chicago in fair volume but there is no rush for it on the part of the consumer. Some dealers think the movement into cellars is a shade better than in normal summers.

Production of beehive coke during the week ended July 7 is estimated by the Geological Survey as 372,000 net tons, as compared with 399,000 tons during the previous week.

Foreign Market And Export News

Low Prices for British Coal Attract Buyers; Production Declines Slightly

There was a further decline in the output of Great Britain's coal mines, as well as in prices. Production for the week ended June 30 was 5,400,000 tons, says a cable to *Coal Age*, as compared with 5,588,000 tons the previous week, a decrease of 188,000 tons. Quotations on the principal grades for last week show a slight decrease.

The supply of Welsh steam coal is exceeding the demand, while the anthracite industry is strong. European buyers have been attracted by the low prices and the German business has increased. Some substantial orders have been booked for steam coals.

The Newcastle market shows substantial improvement, in spite of the holiday season and the decrease in production. Low prices have resulted in inquiries being received from the Continent and there has been heavy bookings for prompt shipments. The prospects for good business during the next three months have brightened. It is expected that Germany, France and Belgium will be in the market for large tonnages as a result of the Ruhr situation. Present prices hold steadily.

Board of Trade statistics on coal exports for the month of June, compared with the same month last year, are as follows, in tons:

To—	1923.	1922.
Germany	1,165,000	890,000
France	1,632,000	982,000
Italy	620,000	467,000
Other countries	3,172,000	2,455,000
Totals	6,589,000	4,794,000

Conditions at Hampton Roads Improve

There was an improvement in business at Hampton Roads last week, prices were stronger and an increase in both inquiries and in actual coal movement was apparent. Movement of coal to Canada was one of the features of the market, while general export business was good. Coastwise trade picked up somewhat.

Bunker business showed some improvement, on the strength of the improvement in general shipping. The

tone of the market was firm, and the outlook brighter than at any time in thirty days. The seasonable slump in coal trade appeared to have been mitigated to some extent.

Difficult for Germans to Buy British Coal

An indication of the unsatisfactory condition of German finances is manifest in the increasing inability of manufacturers in that country to buy British coal. Shortly after the occupation of the Ruhr, British coal was sent to Germany in such quantities as to encourage the operators in that country to expect a very material addition to their market. German industry, however, has continued to go down grade, which coupled with the adverse exchange has made it increasingly difficult for the Germans to buy British coal. The coal stocks which had been built up in some instances are now being rapidly depleted.

French Coal Production Increasing

Demand for all classes of French coals continues active, but shipments from the Nord and Pas-de-Calais collieries suffer intermittingly because of car shortage.

Receipts of Ruhr coke during the first twenty-five days of June amounted to 136,000 metric tons.

Production of French collieries in May in metric tons was: Coal, 3,129,317 tons; coke, 161,943 tons and patent fuel, 213,471 tons. The production in April was: Coal, 2,999,617 tons, coke, 156,035 tons and patent fuel, 214,342 tons. Of the above tonnages the Nord and Pas-de-Calais collieries produced 1,618,445 tons of coal in May and 1,578,009 tons in April; 104,740 tons of coke in May and 101,317 tons in April, and 110,321 tons of patent fuel in May and 117,143 tons in April.

News Items From Field and Trade

ALABAMA

The fifth annual field meet for the demonstration of first-aid and mine-rescue work will be held in Woodrow Wilson Park, Birmingham, July 21, under the auspices of the Alabama Mining Bureau and the U. S. Bureau of Mines. A large number of teams from coal mines and industrial plants have entered the contest for the cup and other prizes.

William M. Cook, 55, secretary and treasurer of the Black Creek Coal Co., of Nauvoo, a mining town 70 miles northeast of Birmingham, was shot and killed by T. L. Sharp, 65, president of the company, July 7. Cook and Sharp had been partners for many years and owned other mining properties jointly in eastern Kentucky, where they operated under the name of Sharp & Cook.

The State Board of Examiners will hold a session July 23, 24, 25, 26, at Birmingham, to pass on applications for certificates as first and second class mine foremen and fire boss to work in Alabama coal mines. The examination will be held under the direction of Chairman C. H. Nesbitt, chief mine inspector.

COLORADO

The third annual week-end conference on "Human Relations in Industry" will be held on the Y. M. C. A. Conference Grounds at Eastes Park on July 27-29. The sessions will open at 8 o'clock, Friday evening and the closing sessions will be on Sunday afternoon. Among those on the committee are: E. S. Brooks, vice-president and general manager of the Union Pacific Coal Co., Rock Springs, Wyo., Moroni Heiner, vice-president, United States Fuel Co., Salt Lake City, and E. H. Weitzel, vice-president and general manager, the Colorado Fuel & Iron Co., Pueblo.

The Denver & Rio Grande Western spent \$7,700,000 in upbuilding the system and service since the receivership under Joseph Young began in July, 1922, and expects to put that much more into the system during 1923, though the receiver has resigned and another operating head is to be chosen. The road has added 10 new Mallet freight locomotives and 700 70-ton coal gondolas. It expects to facilitate car distribution through the Utah mines it serves by installing soon a telephone system out of Soldier Summit.

ILLINOIS

And now comes the minority report of the legislative committee which investigated the Herrin massacre aftermath to see whether the officials of the state did their duty. Two members of the committee, Representatives Curran and Pierce, find that adjutant General Carlos Black and his aide, Colonel Sam Hunter did all that any two officers could do, failing to get troops to the scene in time to prevent the massacre because nobody could foresee what was going to happen. The two committeemen also absolve Governor Len Small from all responsibility. Representative Pierce was one of the men indicted for jury fixing in the trial of Governor Small for misappropriation of state funds. The majority report condemned all officials for non-performance of duty.

INDIANA

Production of coal at shipping mines in Indiana for the years 1917 to 1922, classified by counties, railroads and beds of coal, is the subject of a statistical report just published by Jonas Waffle, secretary of the Indiana Coal Traffic Bureau, Terre Haute. The report shows that production from the Fifth Vein in each of these years except 1918 represented more than half the state total and that production from the Fourth Vein was more than 30 per cent in each of these six years except 1920. The C. & E. I. RR., is the largest originator of coal in Indiana, with the Milwaukee and the Pennsylvania the next largest roads.

KENTUCKY

The U. S. Engineer's office at Louisville will receive bids until July 23 for furnishing 60 carloads of mine-run f.o.b. Addison.

That the Lake embargoes are playing havoc with coal operators is shown in reports reaching Louisville from the Harlan field, which states that one operator who took a 200-car order recently later received an embargo, and some twenty cars which had been loaded and pulled, had to be set back on his tippie siding.

According to coal men and traffic men of Louisville the embargo situation on coal moving to Lakes has aided eastern Kentucky operators steadily since the season opened. Movement has been heavy and bottoms scarce, as some ore boats have been going back empty to save time in transportation of ore, which it is said is more needed than the revenue from transporting coal. Some of the connecting lines have from time to time placed and later lifted embargoes, but congestion has now reached a point where the producing lines are being forced to embargo, as they can't move coal from their own systems to connections. The present embargo on the L. & N. lines may have a marked effect if it lasts any length of time.

MINNESOTA

The hearing by the Federal Trade Commission in St. Paul was suspended for the last few days of June, due to the exhaustion of funds. It was resumed July 2, when the new year's funds became available. The testimony is much of a repetition, with endless letters and circulars issued by the dock association or some of its members, touching upon an agreement or understanding either as to prices or methods of handling public contracts.

A tour of inspection of the Pittsburgh Company's docks at Duluth has been made by John A. Donaldson, vice-president of the company, and the following directors: T. F. Gillespie, E. M. Love, Peter Reiss, George Taylor and W. G. Worden. They were accompanied by W. H. Roehl, of Minneapolis, and J. A. Ferguson, of Duluth. The latter is sales agent. It is expected that the Pittsburgh will soon decide upon and announce a new selling policy. It is claimed that the dock companies here are gaining headway over Illinois coal.

MISSOURI

The Missouri Pacific has discontinued the office of fuel agent at St. Louis but H. W. Salmon is retained under the title of fuel purchasing officer.

NEW YORK

The U. S. Shipping Board on July 7 opened bids for furnishing and delivering alongside vessels, New York harbor, 2,000 gross tons classified Pool 9 coal. The prices ranged from \$5.38 to \$5.97 per gross ton or on a basis of about \$2.10 to \$2.63 per net f.o.b. mine. The contract was awarded to O. Jackson Meyer, Inc., of Philadelphia, at \$5.38 per gross ton alongside, or about \$2.10 per net ton f.o.b. mine. Other bidders and prices submitted were: Gauley Coal Mining Co., \$5.97; Seiler Coal Co., \$5.53; Shawnee Fuel Co., \$5.75; W. A. Marshall & Co., \$5.76; Steamship Fuel Co., \$5.43; W. H. Bradford & Co., \$5.67; E. Russell Norton, \$5.83; Hartmann Coal Co., \$5.60; H. B. W. Haff, \$5.80, and Majestic Coal Co., \$5.93.

Bids were opened on July 9 by the Board of Education of New York City for furnishing and delivering to school houses in Greater New York 26,500 net tons of broken coal, 3,900 tons egg coal, 2,730 tons stove coal, 4,370 tons pea coal, 66,600 tons No. 1 buckwheat coal and 3,900 tons semi-bituminous coal. The Steamship Fuel Corporation was awarded the contract for furnishing the coal requirements in Manhattan, Bronx and Richmond boroughs at prices ranging from \$12.54 to \$14.94 for broken coal, \$13.19 to \$15.24 for egg and stove, \$9.74 to \$12.94 for pea coal, \$6.12 to \$6.74 for No. 1 buckwheat and \$6.64 to \$7.24 for semi-bituminous coal. Three other bidders on the contracts for Manhattan and Bronx submitted prices ranging from \$13.20 to \$13.73 for broken coal, \$13.20 to \$15.29 for egg and stove, \$10.20 to \$11 for pea coal, \$7.14 to \$7.70 for No. 1 buckwheat and \$7.77 to \$8.79 for semi-bituminous coal. The Wyoming Valley

Coal Co. obtained the following contracts: Brooklyn—Broken and egg sizes, \$12.54; stove, \$12.94; pea, \$9.54; No. 1 buckwheat, \$6.08, and soft coal, \$6.62. Queens—Broken and egg sizes, \$12.74; stove, \$13.14; pea coal, \$9.74; No. 1 buckwheat \$6.28, and soft coal, \$6.62. Parental School, Queens—Broken coal, \$6.34. For furnishing and delivering coal to the schools buildings at Rockaway Jameson & Bond Co. was awarded the contract at \$14.44 for broken, egg and stove sizes and \$12 for pea coal.

NORTH DAKOTA

The Northern Lignite Coal Co. has been incorporated in Fargo with a capital stock of \$100,000 by Thomas Buchanan, of Fargo, and Clarence O. Stee, of Dazey.

OHIO

E. L. Greever, attorney, of Tazewell, Va., representing southern West Virginia operators, speaking at the monthly luncheon of the Cincinnati Coal Exchange, held July 12 at the Old Colony Club rooms, said that the United Mine Workers were intent upon creating a labor monopoly and that in the end they would be able to dictate where coal should be shipped and what price it should command. He held that the solution to the whole of the coal "problem" was in preventing strikes.

Among problems taken up at a recent meeting in Cincinnati of the heads of the sales and mining departments of the Blue Diamond Coal interests was the development of the company's coal lands in Lee County, Virginia, and the proposition of bringing coal over a mile down the sides of Little Black Mountain. These developments have been under way for the past six months and it is hoped to have the coal moving from there before Sept. 1. The interests of the company now are in Perry and Harlan Counties, Kentucky, and the Jellico district of Tennessee. According to those interested, so much benefit was derived from the sessions that it was concluded to hold them every six months in Cincinnati.

The North-East Coal Co., with a capital of \$500, has been incorporated by interests connected with the Pennsylvania-Ohio Power & Light Co., to take over between 8,000 and 10,000 acres of coal lands in Jefferson County, Ohio, along the Ohio River in connection with the Ohio River Edison Co. power development there.

OKLAHOMA

The Buck Creek Coal Mine Co., of Panama, has let a contract to electrify its mine on the Bedwell No. 2 lease and will install pumps, fans and coal cutters.

PENNSYLVANIA

Negotiations for the sale of the Langcliffe mine of the Suffolk Coal Co. at Avoca to the Suffolk-Anthractite Collieries Co. were concluded in Philadelphia July 11. The consideration is said to be in excess of \$1,000,000. The new company, headed by J. E. Crasse, Jr., took possession of the property July 12.

Shipments of anthracite during June, 1923, as reported to the Anthracite Bureau of Information, Philadelphia, amounted to 6,634,787 gross tons, as compared with 6,564,285 tons during the preceding month of May, an increase of 70,502, or a little more than 1 per cent. Shipments during the month of June this year show an increase over the corresponding month of 1921 of 602,850 tons, of nearly 10 per cent. The average monthly shipments for the first quarter of the current coal year amounted to 6,457,615 tons, an increase over the average for the first quarter of the coal year 1921-22 of 8.9 per cent., and over the same period in 1920-21 of 12.04 per cent. Shipments by originating carriers were as follows:

	June 1923	May 1923
Phila. & Reading.	1,165,468	1,152,026
Lehigh Valley.	1,138,497	1,150,037

Lehigh & New England.	337,494	347,435

Totals: 6,634,787 6,564,285

Jack Ronkie and John Benelli were injured on July 7 when they were caught in a delayed explosion in the mines of the Sunnyside Coal Co., Jessup. Ronkie died in the afternoon. Benelli, although suffering from severe injuries to his eyes, cuts and bruises of the face, head, arms and

hands is expected to recover. According to information, when the men had prepared the blast the charge failed to go off and they came back to see what was wrong. They had just reached the chamber when the explosion occurred, sending a shower of rocks and coal in all directions.

John C. Brydon, of Somerset, president of the Somerset County Coal Operators' Association, who was recently elected president of the National Coal Association of the United States, was the guest of honor at a reception and banquet at the Somerset Country Club July 3. The affair was attended by prominent coal operators and friends of Mr. Brydon. Talks were given by Judge Francis J. Kooser, of Somerset; Congressmen S. A. Kendall, of Myersdale, and Congressman Rhodes, of Missouri, chairman of the House Mining Committee.

A deal has been closed whereby the Pennsylvania Coal & Coke Corporation has become the owner of a valuable tract of land near Ebensburg, where the corporation will sink a shaft. It is said the company intends laying out a town in the near future. The company owns thousands of acres in the vicinity of the proposed new town, which will be located several miles north of Ebensburg.

The Madeira-Hill Coal Mining Co., plans the sinking of a shaft at Morann, near Houtzdale, to tap the lower coal veins. According to unofficial reports, the project will cost in the neighborhood of half a million dollars. The shaft will be 200 ft. deep and the operation is to be equipped with every known convenience of mining and shipping of coal on a vast scale. One hundred houses are to be erected at Morann to accommodate the miners. According to the plans, double railroad tracks will be laid to the tipples so that two cars may be loaded at the same time. A third track will be used to convey the empty cars to the shaft, the cars to be switched to the loading tracks as needed. The new tracks will connect with the Whiteside branch, the coal thus reaching its destination over the Pennsylvania lines. Another project which the Madeira-Hill company has in mind is the sinking of a second shaft between Houtzdale and Morann, to reach other coal deposits which the company has in that vicinity.

The homes of four miners were dynamited at Pittston July 13, among them that of Alex Campbell, who is a member of the scale committee which is negotiating with the coal operators at Atlantic City. The front portions of the houses were blown out and the occupants tossed from their beds, but no one was hurt. The first blast occurred at the home of Campbell and other blasts followed at the homes of Charles Alba, Michael Dezalvo and Joseph Martinetta. Campbell had returned from Atlantic City in an effort to aid in the adjustment of a strike at No. 6 and No. 9 collieries of the Pennsylvania Coal Co. He is chairman of the General Grievance Committee of the Pennsylvania Coal Co. and the Hillside Coal & Iron Co. and presided at a meeting of strikers July 12. The dynamiting occurred three or four hours after the meeting.

City officials of Philadelphia profiting by past experience, are laying in next winter's coal supply at the rate of 150 tons a day, exclusive of another large quantity in car-load lots. In 1922 the Municipal Anthracite consumption was 249,800 tons.

John B. Gallagher and Claude Zerbey, of Wilkes-Barre, have been notified of their reappointment as auditors for the United Mine Workers. Their terms have been extended to April 1, 1924. Rinaldo Cappelini, newly elected district president, had declared he would remove all members of the old administration, but it is said that he has no authority over the auditors because of their connection with the international organization.

The Philadelphia & Reading Ry., it has been announced, will spend about \$500,000 on the erection of a large coaling station at Rutherford, on the Lebanon Valley division. This consists in the erection of a 2,000-ton capacity coaling bin with coal crushing machinery plant. Rutherford is just east of Harrisburg, and at this point locomotives for Philadelphia and other eastern points are recoaled and watered. There is a big freight yard there, and the change includes rearrangements of tracks and construction of deep-water and inspection pits.

The Lehigh & Wilkes-Barre Coal Co. declared a dividend of 8 per cent, payable on June 26. This is the same as was paid in December of last year. During 1921 the company paid two special dividends, one of \$75 a share on March 5 and another of \$35 a share on Nov. 29.

The following coal companies were incorporated at the State Department recently: **L. J. Pentzler Coal Co., Inc.**, mining, buying, selling and dealing in coal and coal lands, Philadelphia; capital stock, \$50,000; treasurer, John T. Dwyer, 871 North 43d street, Philadelphia, who with L. J. Pontzler, Collingswood, N. J., and M. E. Strock, Collingswood, N. J., incorporated the company. **The Star Fuel Co.**, Perryopolis, mining coal and manufacturing coke and other products; capital, \$25,000; treasurer, J. W. Flanagan, Perryopolis; incorporators, R. M. Pollock, Perryopolis; John G. Pollock, Star Junction, and Scott Dunham, Star Junction. **Colonial Coal & Coke Co.**, of Pittsburgh; mining, buying, selling and preparing coal for the market; capital, \$100,000; incorporators, E. A. Morris, 2032 Wendover street, Pittsburgh, treasurer; R. M. Carpenter and T. B. Humphries, Pittsburgh. **The Sam-Hill Coal Co.**, Euclid, mining, shipping and preparing coal for the market; capital, \$5,000; incorporators, Hyman Witten, Tyler, treasurer; A. D. Carpin, Euclid, and Sam Golumbic, Tyler.

The Wills Coal Co. has been organized at Uniontown with a capital of \$50,000 by T. J. McLernan, Harold W. Semans and W. Clark McLernan.

During a heavy rain and electrical storm July 4 night the large power house at the John O. Ream mine, near Berlin, was struck by a bolt of lightning and the building, generators, motors and all electrical equipment in the plant were destroyed by fire, which followed the crash. The total loss is estimated at about \$20,000, which is partly covered by insurance.

The Reading Company, the Reading Railway and the Reading Coal Co. will soon call special meetings of stockholders to act on the execution of the segregation plan filed and accepted by the District Court. Under the Pennsylvania law sixty days' notice is required for such meetings, which probably will be held about Oct. 1. Counsel for the companies is drawing up two new mortgages to be executed by the Reading Company and the Reading Coal Co. Under the order of the District Court the new coal company which is to be formed to acquire the Reading Company's interest may ultimately be dissolved and the stock of the Reading Coal Co. distributed pro rata to the stockholders of the new coal company. The order provides that at any time after the general mortgage shall have been satisfied and discharged as against the coal company, or the several liabilities of the coal company on the unexchanged general mortgage bonds shall have been satisfied, the new coal company may distribute the stock of the Reading Coal Co. to its own stockholders and thereupon dissolve.

The Barnes-Quemahoning Coal Co. at Listie was taken over on July 1 at trustees' sale by the Listie-Quemahoning Coal Co., a corporation formed by a group of men including Connellsville and Scottsdale residents. The plant has a capacity of 600 to 800 tons of coal daily but is not operating at that strength just now. Those in the new organization are the Joseph R. Stauffer trust estate, J. L. Kendall and J. L. Kendall, Jr., of Pittsburgh; Walter F. John M. and D. Reid Stauffer and F. L. Brown, all of Scottsdale; Andrew Keiser, of Philadelphia, and E. T. Norton, of Connellsville.

UTAH

George W. Hahn, of the United States Fuel Co., has been appointed chairman of the entertainment committee for the summer meeting of the Rocky Mountain Coal Mining Institute in Sale Lake City, Aug. 27-29. The Institute delegates expect to spend Aug. 26 in Rock Springs, Wyo., as the guests of the coal companies there.

VIRGINIA

The City of Norfolk has closed a contract with the Chesapeake & Virginia Coal Co. Lynchburg, for from 8,000 to 10,000 tons of Pocahontas and New River steam coal to be delivered during the ensuing year at \$3.20 at the mines. This is the only contract reported in two weeks.

WEST VIRGINIA

Coal loadings on the Chesapeake & Ohio Ry. system for the month of June exceeded the loadings for May by 34,025 tons, according to the monthly report, issued July 2 at Huntington. Total loadings for the month were 3,069,300 tons, or 61,386 cars. During May loadings were 3,035,275 tons, or 60,705 cars. The figures for June were slightly below those of June, 1922.

Twenty-nine tracts of coal in the Richland district, north of Wheeling, with a total acreage of 3,354 have been purchased by the **Ohio County Fuel Co.** for \$839,000. The purchase, it is reported, was made to supply fuel for the American Gas and Electric company, and West Penn's power plant at Beech Bottom.

Announcement has been made by R. M. Lambie, chief of the State Department of Mines, that the dates for annual examination of candidates for certificates as mine foremen have been fixed as follows: Morgantown, University Building, on July 20; Clarksburg, Tower School Building, Aug. 23; Wheeling, High School building, on Aug. 20. The above are for examinations in northern West Virginia only.

The West Virginia Great Lakes Coal Corporation, which was recently organized with a capital stock of \$2,500,000 and which has acquired the interests of the Fairmont-Pittsburgh Coal & Coke Co., plans to establish yards in Erie, Buffalo, Cleveland, Fairmont and other points and to sell coal direct to the consumer through such retail yards. General offices of the company are to be established in the Odd Fellows Building at Fairmont. Officers of this corporation are: J. Edwin Gaskill, president; J. S. Lemasters, vice president; G. J. Brunkman, of Pittsburgh, Pa., treasurer, and H. M. Hill, secretary.

WASHINGTON

The new mine of the Cherry Creek Coal Co., west of Castle Rock, is now producing and its output is reaching Kelso by truck.

Bids are to be received until 10 A. M. July 25, at Fort Mason, San Francisco, or the Seattle Quartermaster, Intermediate Depot, Seattle, for furnishing and delivering coal required by the army stations on or near the Pacific coast. The amounts required are 22,534 net tons bituminous nut coal over 2-in. screen, 19,403 net tons run of mine coal, 10,507 net tons bituminous coal, nut over 1½-in. and through 3-in. screens, and 1,467 cords of wood. All quantities of coal specified will be subject to a 50 per cent increase if the government so desires. Bidders are required to give an analysis of coal upon which prices are submitted, as well as price per net ton f.o.b. mine and price per net ton f.o.b. cars at place of destination.

WISCONSIN

William C. Frye, for seven years president of the Chain Belt Co., Milwaukee, has retired from active participation in its affairs and has been succeeded by **C. R. Messinger**, vice-president and general manager since 1917. Mr. Frye is retiring after an active association with the company for 28 years, during which time he occupied practically all the important executive positions in the company. Mr. Messinger, who succeeds Mr. Frye, became associated with the company in 1917 after eight years as general manager of the Sivy Steel Casting Co. He also is president of the Interstate Drop Forge Co., vice-president of the Sivy Steel Casting Co., vice-president of the Federal Malleable Co., all of Milwaukee, and a director in the Nugent Steel Castings Co., of Chicago, and the First Wisconsin National Bank of Milwaukee.

WASHINGTON, D. C.

Substantial progress is being made by the railroads in their program to store by Sept. 1, their fuel coal for this winter. **Forty-four railroads, representing 75 per cent of the total mileage of the Class stored 1,821,412 tons of coal during June.** These 44 railroads on July 1 had a total of 6,638,812 tons of coal in storage.

Transfers and promotions of the personnel of the research branch of the Bureau of Mines have been made public by the Department of the Interior as a result of the resignation of Dr. R. B. Moore, former chief chemist, effective July 1. With the advancement of **Dr. S. C. Lind**, formerly superintendent of the rare and precious metals experiment station at Reno, Nev., to the post of Chief Chemist and chief of the division of mineral technology to succeed Dr. Moore, other changes in posts throughout the country were made. During the past year G. St. J. Perrott and S. P. Kinney have conducted an intensive study of the combustibility of coke in blast furnaces. **This work will hereafter be conducted by Mr. Kinney** in connection with the operation of the experimental blast furnace at the North Central Experiment

Station, Minneapolis, and at commercial furnaces in South Chicago, Ill., and Youngstown, Ohio. **John Bizard**, who has had charge of the Bureau's fuel work at its Pittsburgh Station, has resigned to accept a position with a commercial concern in New York City, where he will be engaged on the design of super-heaters and heat transfer apparatus. **C. C. Mather**, of Pennsylvania, has been appointed as a mining engineer aid in the minerals and coal-leasing section of the Bureau, at Denver. **John F. Barkley** has been appointed as an assistant fuel engineer and will have charge of the conducting of tests for the fuel efficiency survey.

A total of 1,502,208 tons of coal has been mined from public domain leased by the Department of the Interior since the General Leasing Law went into effect, according to information given out July 12 by the General Land Office. Upon these leases the government has received an average of royalty of 10c. per ton. Most of these leases have been issued on public land in Utah, Colorado, and Wyoming although several other states are represented and they call for a minimum total annual production of 2,895,325 tons of coal and a required investment of \$4,012,800 at the end of the three-year period allowed for the full installation of mining machinery. A considerable number of leases have been made for small mines intended to supply local needs only where the production will not exceed 1,000 tons a year. Prospecting permits have been issued for a total of 378,685 acres of public lands.

CANADA

A bill has passed the Dominion House of Commons, permitting the **Calgary & Fernie Ry.** to build a line from Calgary to the headwaters of the **Elk River**. The construction of this line forms part of an agreement between the Calgary & Fernie Railway Co. and an English syndicate that is taking over the coal mines owned by the company.

The final report of the committee of the Dominion Senate, appointed to investigate Canada's coal supply, suggests the feasibility of a branch line from the Canadian National system into the Peace River region for the purpose of opening up extensive deposits of anthracite and semi-anthracite that are known to exist in that part of Alberta and British Columbia. The committee further recommends that the Dominion Fuel Board co-operate with the transportation companies with a view to reducing freight rates from the West to Ontario points, thereby increasing the use of Canadian coal in Canada. Some large deposits of anthracite and semi-anthracite have been proved in the Smoky River district of Alberta and high-grade semi-anthracite and bituminous coals have been developed west of Hudson's Hope, in British Columbia. It is assumed that it is these deposits that the committee of the Senate had in view when it made the foregoing recommendations.

The annual employees' picnics are much enjoyed and keenly anticipated events by the coal miners of the Canadian Collieries (D), Ltd., and the Western Fuel Corporation of Canada. The Western Fuel Corporation's employees held their picnic on June 30 at Newcastle Island and the outing of the Canadian Collieries (D), Ltd., will be held July 21.

Coal production in British Columbia fell off materially in the month of May as compared with April, the difference being some 28,242 tons. Vancouver Island collieries are responsible, to a large extent, for the drop, their output in April being 115,628 tons and in May 97,367 tons. In the Nicola-Princeton field the chief producer, Coalmont Collieries, mined about the same tonnage in May as in April and in the Crow's Nest Pass Coal Field there was a slight drop, about 7,415 tons. An improvement for June is certain.

It is announced that boring tests carried on by the Canadian Collieries (D), Ltd., in the Sable River district near Nahaimo, Vancouver Island, have demonstrated that the coal bodies of that region are capable of a production of 3,000 tons a day for 300 years.

The annual meeting of the Crow's Nest Pass Coal Co., Ltd., elected directors as follows: W. R. Wilson, H. B. McGivern, W. H. Robinson, E. P. Earle, A. H. McNeill, J. T. Maher, F. F. Edgar, L. C. Gilman, and Dr. G. W. Howland. Officers elected were: President, W. R. Wilson; Vice-Presidents, H. B. McGivern and W. H.

Robinson; Treasurer, A. Klauer; Comptroller, G. H. Hess Jr.; Secretary, J. S. Irvine. The company's net profits from all sources for the year 1922 totalled \$213,959, though the directors paid four dividends of 1 1/2 per cent each, making a total of 6 per cent for the year, amounting in all to \$372,690. The company spent last year \$35,293.80 on improvements and the coal mined totalled 569,339.14 tons as against 774,847 tons in 1921. The coke produced was 46,368 tons as compared to 66,569 tons in 1921.

An important coal property situated on the south shore of Wabamun Lake, northern Alberta, is being developed by the British Canadian Collieries, Ltd. The leased rights obtained from the Canadian government and the Canadian Pacific Ry. include some 2,200 acres. The coal seam shows on the lake front for the length of a mile and its existence has been known for some time. Development has been retarded because it is on the opposite side of the lake from the railway, making the transportation problem serious. The company has obtained a charter for a branch railway eight miles long connecting with the Grand Trunk Pacific. A seam has been demonstrated 24 ft. in thickness throughout. It is estimated that there is 30,000 tons of first-class coal to the acre. On 1,200 acres the coal carries an overburden of from 20 to 28 ft. The average depth is 30 ft. It is the intention to strip this.

The British Empire Steel Corporation reports coal output in June of 514,604 tons as compared with 382,982 tons in June, 1922, and a total production of coal for six months ending June 30 of 2,822,801 gross tons, compared with a production of 1,763,780 tons during the same period last year. This shows an increase in six months of 1,059,021 tons.

The Dominion Government is asking for tenders for bituminous and anthracite coal supplies for various public institutions throughout the country.

MEXICO

It is stated that the American Smelting & Refining Co. will spend more than \$4,000,000 in developing the Rosita coal field near Sabinas, State of Coahuila, Mexico, which it purchased some time ago. Coke ovens will be constructed and other improvements will be made. According to the statements of engineers who have been exploring the coal field there are approximately 100,000,000 tons available for conversion into high-grade coke. The output of the ovens will go to supply the smelters of the company at Monterey, Asarco, Chihuahua and Aguas Calientes.

Association Activities

Virtually all the producing coal companies and selling agencies with offices in Huntington are represented in the newly organized **Huntington Coal Exchange**, which is to be affiliated with the Huntington Chamber of Commerce. The Exchange has been organized with a view to helping the consumer of West Virginia and eastern Kentucky coals solve his problems and to insure closer co-operation between producer and seller. Meetings will be held every Tuesday at noon. One of the first things to be undertaken by the exchange will be to see that Huntington is given wider publicity as "headquarters for quality coal," it being pointed out that within the last few years the city has become an important trading center owing to its proximity to the Logan, Kanawha and northeast Kentucky fields and owing to the large number of producing companies and selling companies having offices there. The exchange elected as its first president I. F. Vass and named as vice-president T. H. Hooper and as secretary-treasurer, J. J. Lewis. The personnel of the various committees is as follows: Transportation and Communication, F. L. Poindexter, G. J. Beidenmiller, H. A. Smith; Trade Rules, Roy Cunningham, Fred Schoew, Walter Neekamp; Membership, M. M. Tyree, S. J. Hyman and Vandyk Clark; Entertainment, H. R. Freeman, G. D. Alexander, Gerald O'Connor; Publicity, O. A. Doob, John A. Kelly and J. Barrett.

About 350 operators from the district attended the annual meeting of the **Central Pennsylvania Coal Producers' Association** and the **Association of Bituminous Operators of Central Pennsylvania** held on July

11 at Camp While-Away, near Indiana, while there were a number of invited guests, including prominent men from the Pittsburgh district and the Connellsville coke region. Speakers of the day were: Superintendent John J. Johnston of the Tyrone division of the Pennsylvania R.R., Prof. C. R. Anderson of the forestry extension department of State College and Attorney A. M. Liveright of Clearfield. Superintendent Johnston predicted a heavy volume of traffic this fall and winter and invoked the co-operation of the shippers. Forestation of coal lands was presented by Professor Anderson, who spoke of the advisability of using idle lands in the coal fields to produce timber for commercial use and for mine props. As a result of the discussion application will be made to the Department of Forestry for half a million seedlings. Operators and visitors were guests at a dinner at the club at noon. The following directors were elected for the Central Pennsylvania Coal Producers' association: G. Dawson Coleman, Philadelphia; Rembrandt Peale and Charles A. Owen, New York; J. William Wetter, Philipsburg; James B. Neale, Minersville; S. T. Brown and B. M. Clark, Indiana; James H. Allport, Barnesboro; R. H. Sommerville, Winburne; M. J. Bracken and H. J. Meehan, Johnstown; J. S. Sommerville, Robertsdale; Fred B. Kerr and G. W. Shillingford, Clearfield; J. R. Caseley, Du Bois; C. B. Maxwell, Morrisdale; W. S. Balisdale, Punxsutawney; Harry Boulton, Clearfield; W. R. Craig, St. Mary's; D. T. Price, Windber, and E. W. Robertson, Du Bois. The Association of Bituminous Operators elected these directors: Messrs Clark, Peale, Caseley, Robertson; H. B. Scott, of Philipsburg; Brown, Wetter, Shillingford, J. S. Sommerville, Thomas F. Kelly of Coalport, William Lamont of Elmora, I. A. Boucher, of Beaverdale, and Boulton and Bracken. Officers of both boards will be elected at a later meeting.

Obituary

F. W. Walker, formerly a coal retailer of Xenia, Ohio, during the past four years a traveling salesman for the Columbus office of the Elk River Coal & Lumber Co., died at St. Vincent's Hospital, Indianapolis, recently following an operation.

Hugh Moren aged 74, a director of the Duquesne National Bank, the Pittsburgh Steel Foundry Co., the Consolidated Ice Co. and a pioneer in river and coal development in the Pittsburgh district, died July 10 at his home, following an illness of several weeks. Mr. Moren was born at Freemans Landing, W. Va. His first business enterprise was the founding in 1881, with his brothers, of the Advance Coal Company. They sold the company in 1899 to the Monongahela River Consolidated Coal & Coke Co., with which concern Mr. Moren became master of transportation, in charge of a fleet of steamboats operated by the company. Mr. Moren leaves two brothers, Thomas Moren and James Moren.

Herbert M. Matthews, coal traffic manager of the Baltimore & Ohio R.R., for the past eight years, died Tuesday, July 10, of pneumonia at his country residence on the Bush River, near Aberdeen, Md. Mr. Matthews was born Oct. 11, 1860, at South Bend, Ind. He entered railway service Nov. 21, 1881, as clerk in the general freight office of the Chicago, Burlington & Quincy R.R., at Chicago, being promoted to general agent of that company at Pittsburgh, Oct. 15, 1886, where in April 1897, he first became identified with the Baltimore & Ohio as commercial freight agent. Six months later Mr. Matthews was advanced to division freight agent and on Feb. 1, 1904, in addition was made coal and coke agent at Pittsburgh. Mr. Matthews first went to Baltimore in July, 1905, when the Baltimore & Ohio made him general coal and coke agent, and in July, 1915, he became coal traffic manager of the system. During Federal control of the railroad he was a member of the committee in charge of coal and coke traffic in Trunk Line and New England territory and when the committees were reorganized after the return of the roads to private ownership and management, March 1, 1920, Mr. Matthews was for a year chairman of the Coal and Coke Committee, Trunk Line territory, and a member of that committee until his death. The funeral will be from the residence of his brother-in-law, R. C. Crawford, 210 Hutchinson Avenue, Edgewood, near Pittsburgh. Mr. Matthews was unmarried.

Traffic News

Loading of coal by the Lehigh Valley R.R., in June last amounted to 1,224,063 tons of anthracite, the largest total in fifteen months. Last year loadings were very small because of the miners' strike, while in 1921 the tonnage was 1,098,786. The Lackawanna R.R. reported anthracite loadings in June of 911,637 tons.

The New York Central R.R. Co. has been authorized by the Interstate Commerce Commission to issue not exceeding \$100,000,000 of capital stock in exchange for a like amount of its outstanding 20 year 6 per cent convertible gold debenture bonds.

Rates on soft coal from Manitowoc and other Lake Michigan points to Minneapolis and St. Paul were found not unreasonable or unlawful by the I. C. C. in dismissing the case of the Northwestern Traffic Service Bureau, Inc., against the Central Wisconsin Ry.

The Interstate Commerce Commission in a tentative decision in the case of the Lincoln Gas Coal Co. and others vs. the Baltimore & Ohio R.R. and others, held rates on bituminous coal to be reasonable from mines near Washington and Vienna, Pa., to Eastern destinations.

In a tentative report submitted to the Interstate Commerce Commission July 12, Examiner J. F. Eshelmann recommends that the commission find that the rates on bituminous coal, in carloads, from mines in southwestern Pennsylvania to West Virginia destinations are unreasonable. A new scale of rates is prescribed by the examiner.

During June, 2,727,737 net tons of bituminous coal and 296,138 net tons of anthracite passed through the canals at Sault Ste. Marie. Of this tonnage 2,705,037 tons of soft coal passed through the United States canal and 22,700 tons through the Canadian canal. All of the anthracite tonnage passed through the United States canal.

The Erie R.R. Co. has ordered new equipment to cost \$6,500,000. Contracts also have been awarded, it was said, for the reconstruction of 4,459 box cars, 1,000 gondolas and 100 refrigerator cars. Part of the equipment will be delivered and all

the cars will be rebuilt in time to handle the heavy freight shipments expected for this fall.

The Coal and Coke Committee, Trunk Line Territory, announces hearings at 143 Liberty St., New York City, beginning at 10:15 a. m., July 24, and continuing July 25, relative to adjustment of rates on anthracite, bituminous coal and coke from mines to numerous points on the D. & H. Central Vermont Ry., B. & A., B. & M., C. N. E. Ry., Rutland Ry., P. & L. E. R.R., N. Y. S. & W. R.R., B. R. & P., Erie, N. Y. O. & W., B. & O., Pennsylvania and other lines, as well as to consider revision of rules and charges covering weighing and reweighing of cars containing coal and coke.

Railroads of the United States on July 1 had 190,411, or 8.4 per cent of the freight cars on line, in need of repair. This is the smallest number in need of repair since December, 1920. The total on July 1 was a reduction of 10,373 cars compared with the number of freight cars in need of repair on June 15, at which time there were 200,784, or 8.9 per cent. Under the program unanimously adopted by the carriers in New York last April, the number of such cars are to be reduced to 5 per cent by Oct. 1 next.

When the Morgantown & Wheeling R.R. was sold at Morgantown under a decree of the Circuit Court of Monongalia County the Monongahela Ry. became the purchaser although the property was bid in by the newly organized Scott's Run Ry., which is a holding company. The bid of the purchaser was \$521,929.91 but there are other obligations to be assumed which will bring the total up to about \$1,000,000. There has been such rapid coal development on the Morgantown & Wheeling in the last six or seven years that the property, serving as it does the Scott's Run field, has become extremely valuable, especially as a feeder of the Monongahela Ry., with which it connects at Maidsville. More than 7,300 cars of coal were loaded on the M. & W. in June. Colonel H. C. Nutt, president of the Monongahela Ry., says that extensive improvements will be made and that the purchasing company will make provision for a much better system of operation. Among other things the remaining leg of the "Y" at the mouth of Scott's Run will be constructed, so that more traffic can be handled.

Alleging that the present rates on bituminous coal from the Pittsburgh district of Pennsylvania to ports on Lake Erie are unjust and unreasonable as compared with the rates from mines in other districts in Pennsylvania, Ohio, Maryland, West Virginia, Virginia, Kentucky and Tennessee to the same points, the Pittsburgh Coal Producers' Association and approximately thirty other coal operators in the Pittsburgh district filed a formal complaint with the Interstate Commerce Commission asking for the establishment of lower rates. The complaint states that the operators in the Pittsburgh district produce upward of 25,000,000 tons of bituminous coal yearly. In brief it alleges that the rates from the Pittsburgh district to the Ports of Erie, Erie docks, Conneaut Harbor, Ashtabula Harbor, Fairport Harbor, Cleveland, Cleveland pier, Lorain, Huron, Sandusky and Sandusky dock are "intrinsically unjust and unreasonable in that they are unreasonably high and are likewise unjust as compared with the rates from mines in competing districts."

The net railway operating income of the Class 1 railroads of the United States in May amounted to \$89,999,600, which represented a return on an annual basis of 6.33 per cent on their tentative valuation. The net operating income for the carriers in the Eastern district was at the annual rate of return of 7.72 per cent; the Southern district, 6.72 per cent, and the Western district, 4.43 per cent. The same carriers in May last year had a net operating income of \$62,069,000 or 4.46 per cent. In April this year it was \$83,197,800 or 6½ per cent. Operating revenues of the carriers in May totaled \$547,282,500, an increase of 21.3 per cent over the same month last year, while their operating expenses amounted to \$420,656,000, or an increase of 18.4 per cent over May last year.

The increase in earnings over May last year was largely due to a stimulation in freight traffic which, according to incomplete reports, was the greatest, measured in net ton miles, for any May in the history of the railroads, amounting approximately to 39,000,000,000 net-ton miles. This was not only an increase of more than 42 per cent, over May last year but was an increase of more than 3 per cent over May, 1917, which had marked the previous rec-

ord for that month. Freight traffic in May this year not only exceeded the preceding month, but was the heaviest for any month so far this year. Class 1 railroads during the first five months this year had a net operating income of \$356,966,900, which would be at the annual rate of return of 5.69 per cent, compared with \$273,215,000 or 4.45 per cent, during the corresponding period last year. Operating revenues for the five months' period totaled \$2,553,856,600, an increase of 19.4 per cent over the same period last year, while operating expenses totaled \$2,026,163,600, or an increase of 18.2 per cent.

Coal mines owned and operated by the Chesapeake & Ohio Ry., should not come within the scope of the assigned-car decision, in the opinion of W. S. Bronson, the general attorney of the railroad, in a petition filed July 12 with the Interstate Commerce Commission. These railroad mines "manned by its own employees, digging its own coal," Mr. Bronson contends, "could not by any stretch of imagination be held to be commercial mines. These mines never ship coal in commerce. All the coal mined merely is moved by the railway company in its own cars for its own private purposes, a necessary function to the operation of its railroad." Continuing, Mr. Bronson concludes "that the assigned-car decision does not apply to mines which do not ship coal," and that company mines "are not subject to the decision and the order in this proceeding. Any other interpretation necessarily must be based upon the finding that the C. & O. mines are commercial mines—an absurdity." The opinion is expressed in traffic circles that Mr. Bronson, in filing such a contention, has overlooked the decision of the U. S. Supreme Court in the case of the Interstate Commerce Commission versus the Illinois Central, in which any such doctrine is characterized as being unsound. "It may not be doubted," says the Supreme Court's opinion, "that the equipment of the railroad company engaged in interstate commerce, included in which are its coal cars, are instruments of such commerce."

Coming Meetings

The tenth annual Tennessee First-Aid Contest and Miners' Field Day will be held at Knoxville, Tenn., Aug. 4, in the Knox County Court Yard, under the auspices of the Tennessee coal operators, state mine inspectors and the U. S. Bureau of Mines, R. E. Howe, secretary of the Southern Appalachian Coal Operators Association, secretary-treasurer. J. M. Webb, of the U. S. Bureau of Mines, is instructing the first-aid teams.

The American Institute of Mining and Metallurgical Engineers will hold its annual meeting in Canada. The meeting will start Aug. 20 at Toronto and end Aug. 30 at Montreal. Secretary F. F. Sharpless, 29 West 39th Street, New York City.

Rocky Mountain Coal Mining Institute will hold its summer meeting Aug. 27 to 29 at Salt Lake City, Utah, in conjunction with the International Safety and First-Aid Meet. Secretary, Benedict Shubart, Denver, Colo.

New York State Coal Merchants' Association will hold its annual convention on Sept. 10-12 at Sacandaga Park, N. Y. Executive secretary, G. W. F. Woodside, 250 Arkay Building, Albany, N. Y.

Oklahoma Coal Operators' Association will hold its annual meeting Sept. 13 at McAlester, Okla. Secretary, A. C. Casey, McAlester, Okla.

The American Mining Congress will hold its twenty-sixth annual convention in conjunction with the National Exposition of Mines and Mining Equipment, Sept. 24-29, at the Milwaukee Auditorium, Milwaukee, Wis. Secretary, J. F. Callbreath, Washington, D. C.

National Safety Council will hold its twelfth annual safety convention at the Buffalo Statler Hotel, Buffalo, N. Y., Oct. 1-5. Managing director and secretary, W. H. Cameron, 168 No. Michigan Ave., Chicago, Ill.

The West Virginia-Kentucky Association of Mine, Mechanical and Electrical Engineers will hold its annual meeting Oct. 19-20 at Huntington, W. Va. Secretary-treasurer, Herbert Smith, Robson-Prichard Bldg., Huntington, W. Va.

Coal Mining Institute of America will hold its annual meeting Dec. 19, 20 and 21 at Pittsburgh, Pa. Secretary, H. D. Mason, Jr., Chamber of Commerce Building, Pittsburgh, Pa.

COAL AGE

The Only National Paper Devoted to Coal Mining and Coal Marketing

C. E. LESHER, *Editor*

Volume 24

NEW YORK, JULY 26, 1923

Number 4

Relativity

SOME time ago we pointed out that if the U. S. Coal Commission failed to make comparisons between coal and other industries it might create a wrong impression on the mind of the public, for most people have obsessions which can be shaken from their minds only by the use of actual data. They have, in short, a grievously defective yardstick and cannot measure anything correctly.

Some men, for instance, who have been reading with diligence about the bricklayers and plasterers in big cities have brought themselves to believe that wages in general are much higher than they really are and those whose contact with life brings them in touch with farm laborers and iron-mine workers of Pennsylvania and New Jersey are prone to set the average day wage too low. Similarly those who have steady jobs themselves do not realize in how many industries the men do not know from day to day whether there will be work tomorrow. All our judgments are comparative, and it is necessary for a true judgment that comparisons be broad and that they be chosen so as to illustrate similar conditions.

The U. S. Coal Commission has realized that without comparing coal mines with other industries no adequate presentation of facts in any one industry can be made, but where is the information and where could they obtain funds for such an inquiry into other industries? The funds were not provided nor could they be obtained. The Commission realized that it had a job already too large for the time and force available without any extension of any sort into adjacent fields. What information was available was not used. It was left for each reader to furnish his own yardstick, his own table of wages, of profits, of hours, of turnover and of stability of operation and so forth.

But there was one exception. The Commission in its anthracite report allowed itself to say, using terms of comparison: "Thus in ten years both the retail and the wholesale prices of stove coal have practically doubled. This is in line with the general advance in commodity prices, except that while the wholesale price of metals reached its peak in 1917, of chemicals in 1918, of farm products in 1919, and of other commodities in 1920—all with subsequent declines, usually large—the price of anthracite has continued steadily upward."

All of this is unquestionably true, but nevertheless it is highly misleading. The wholesale price of metals was excessively high in 1917, almost three times the pre-war price; the price today is inadequate. This is admitted by everybody. Furthermore, it is low today because wages are lower than during the war, and taking a table prepared by the *Engineering and Mining Journal-Press* and striking an average of wages it will be found that the increase since 1914 has been only 29 per cent on day laborers above and below ground alike.

In that same period conditions were markedly differ-

ent in the anthracite industry. The wages have been raised more than 29 per cent, no new cheapening process like flotation has been introduced, and there has been no narrow market to make it obligatory, as in some parts of the metal industry, to operate at a steady loss or entirely close down. Consequently the trend of the anthracite market has not been like that of metals—copper, for instance. The copper industry closed down for months and since it has resumed has been wondering if it did well to start up again. Whereas wages in the metal-mining industry declined after the war, those in the coal industry increased, and by the Commission's own showing the wages of contract miners are now 76 per cent higher than in 1914. The wages of company miners since that time have risen 138 per cent and of outside labor 181 per cent.

It must be confessed that the Commission has fallen on a comparison that is unfortunate. We trust its future comparisons, if made at all, will be more explanatory and more diligently elaborated or, at least, more carefully chosen.

The Sacred Contract

JOHN L. LEWIS' strident denunciation of the Nova Scotia local of the United Mine Workers that will not do his bidding is striking proof of the everlasting sanctity of the contract once that organization has put its name to it. The papers ring with praise for the union that thus holds to its word. These "red" mine workers in the far-off corner of Canada have struck when their contract has not expired, when all they have as an excuse is sympathy for union workers in another place who are on strike. They are unceremoniously fired out of the holy of holies and a provisional president is sent from the head office to teach them what discipline means.

Fine! But what about the broken contracts that John L. Lewis will not see? Every district has them—Indiana, Kansas, Illinois in particular. They are the commonest things there are in those fields, so common that they are numbered by the hundred every year, so common they seem to have become commonplace. A constant source of annoyance to the operator, disrupting discipline, breeding discontent and destroying confidence in any contract, these local strikes are in violation of the same contract the breaking of which in Nova Scotia is so mercilessly scored. Nothing is done about them.

When the operators last January met with Lewis in New York to negotiate and sign a new contract for the remnants of the Central Competitive Field, they urged one little concession. They wanted Lewis to concede that he would condescend to recognize these troublesome local strikes and to sit as judge over their settlement. The operators were willing to have the president of the United Mine Workers arbitrate the disputes at these mines when they should have passed

beyond the point of local settlement. The operators wanted action and not delay and disturbance. But Mr. Lewis told them that he could have nothing to do with such trivial matters. Should he have agreed to take jurisdiction, and it was and is entirely a matter of his option, he would have had to compel observance of contract; he might have had to discipline some local presidents and higher officials. His popularity is not too great in those areas and it would have been needlessly stirring up a hornets' nest.

So now with a blare of trumpets and the proper amount of press agenting, he picks on little Nova Scotia, which does not matter much anyway, and tells the world that the United Mine Workers always keep their sacred contracts.

Planning a Nation's Transportation

WHEN the railroads in April agreed on a "program to provide adequate transportation" they set the peg higher than most observers outside the railroad field considered necessary. They were the real optimists on the season's prosperity. Yet each month since then the business that has been offered to the carriers and handled with little or no difficulty has exceeded their estimate. For instance, the anticipated loadings of all freight for the first six months of the year were some 23,500,000 cars, whereas the actual loadings in that period were slightly over 24,000,000 cars. Not only has the total for a six months' period set a new high record but in the last week of June a new high weekly record of 1,021,770 cars was registered.

In other respects have the railroads justified the assertion of C. F. Carter in an address in New York last week that the roads "have come back." In new equipment put in service the figures are large, and incidentally explain a large part of the activity of the iron and steel industry, which in turn has reacted to make more business for the roads. In but two months of the past six have the new locomotives placed in service numbered less than 300 and of new freight cars less than 12,000. Coal cars to the number of 31,744 have entered road service in these six months and some 39,000 are yet on order. On July 1 the number of all freight cars and locomotives awaiting repairs was the lowest in more than two years. Since February the number of tons of freight per car has been above the best record of 1921 and the reports of average miles per car per day is consistently above previous records. Freight is moving freely; with all the heavy traffic there is little or no congestion.

On top of all this the steam roads have added some 4,000,000 net tons of coal to their reserve piles in the six months ended with June. The engine coal in stockpiles has steadily grown from less than 4,500,000 tons on Jan. 1 to more than 8,000,000 tons on July 1. More than 2,000,000 tons above current requirements was taken by the railroads in June.

Here we have a modern exhibition of what can be done by intelligent planning on a national scale. The railroads have not accomplished these things alone and unaided. They have had the backing of the government at Washington and of industry generally. Almost driven to the wall by the loud and insistent demands of the "railroad baiters" that since private management had fallen down the government must take over their operation, the men who run the roads have shown

of what they are made, bringing back their time-honored prestige for accomplishment. The coal industry is being ruthlessly pushed into the same branding stall that once held the railroads. It, too, is an industry that can do things and there are ample signs that the National Coal Association is doing that kind of forward looking that is bringing the railroads out of the hole.

New Methods Need New Public Viewpoint

JUST as everyone is saying "Do it by machine. Eliminate labor. Relieve the workman from grinding toil," comes the inquiry, What is the labor cost of production? How much does labor get out of the selling price?" also "What is the relation between net cost and market price?" The public is anxious to see machinery introduced, is desirous of economies from that source, but still insists that there shall be a minimum margin between labor cost and selling price, suspiciously questioning and bitterly resenting any growth in that differential.

This attitude is not encouraging to the producer whose industry is tainted by public interest. The public begrudges paying him interest on capital invested and on money borrowed, yet at the same time the elimination of labor in industry can be accomplished only by the introduction of machinery, and when much machinery is used the difference between labor cost and selling price should increase. The railroads and mines have boasted that 70 per cent of all costs are for labor. Is that a credit or a debit? Should not our endeavor be to create such automatons in our industry that the labor quota is a much smaller factor than 70 per cent? When it is done the public, it may be supposed, will still insist that the installation of machinery and the return on the capital shall not be considered in the setting of costs, but if the public should take that view there will be an end to progress.

Young communities are the aggressive ones. The channel of commerce with the older nations is blocked by inhibitions till the current grows sluggish. Fortunately, the U. S. Coal Commission is somewhat more considerate and has taken the view that the increase in anthracite revenue may rightly mirror the greater investment on mining equipment, and thinks that if that is so or if prices before the war were too low no exception can be taken by the public. These statements exhibit the cold sanity of the Commission, but the public cannot see the investment even though a funded charge on production—unless it has itself invested, and so investment lags, and with investment the introduction of machinery.

Shall we listen to public clamor and so hedge in coal production with unfavorable rulings that operators will no longer say "Do it with machinery" but "Do it with labor, for only labor charges will be allowed"?

Confusing Publicity

BLOOMFIELD'S Labor Digest, "The Personal Service for Executives," published by Meyer Bloomfield and Daniel Bloomfield, was recently sent us for review. In the issue of July 7, 1923, under a 24-pt. caption "The Coming Coal Strike" we read: "Unless the situation changes very much between now and the first of September, strikes may be looked for both in the anthracite and bituminous coal fields."

Storage Battery Charging Station, Ridgewood Mines, Traders' Coal Co.

Advantages and Reasons for Increased Application Of Storage-Battery Locomotives to Mining

Mining Conditions Create a Demand for Storage-Battery Locomotives—Economy in Mining Realized by Their Use—Storage Battery the Power Plant—Quick and Simple Calculations for Determining Battery Capacity

BY EDGAR J. GEALY

Electrical Engineer; Associate Editor, *Coal Age*

IN ALL industries in which the electric industrial locomotive has been adapted it has played an important part in the solution of material-handling and haulage problems.

The outstanding advantages of the electric locomotive may be summed up as follows:

- (1) Consumes power only when in actual operation.
- (2) Can be run by one man without special training.
- (3) Is ready at all times for immediate use.
- (4) Has large momentary overload capacity.
- (5) Has simple and easily operated control.
- (6) Has low maintenance cost due to small number of wearing parts.
- (7) Requires attention only when in use.
- (8) Can be run in places where smoke and fire risk of a steam locomotive would forbid its use.

During the last few years the storage-battery locomotive has won a lasting place in the coal-mining industry. It is particularly adaptable to gathering service and all underground service where there are difficulties in erecting and maintaining trolley wires and in bonding the rails, or where wooden rails are used. It also is suited for roustabout haulage when mines are first opened or when the mines are idle and construction and inspection work must go on.

Besides the more general advantages of electric haulage, the storage-battery locomotive has several addi-

tional advantages peculiar to itself. These may be briefly enumerated as follows:

- (1) It eliminates the need of trolley lines and of bonds on any track over which it runs.
- (2) In thin coal it is unnecessary to brush the top or take up bottom to make room for mules.
- (3) No time is lost in making cable connections with the trolley line on entering rooms or in splicing the reel cable when it is cut.
- (4) Wherever used it eliminates the danger of personal contact with the trolley line.
- (5) In a gassy mine, away from the headings, there is no danger of spark at the wheels or at the trolley.
- (6) It is independent of either substation or power plant, so that it may be used when other operations have ceased.
- (7) The speed and haulage capacity of the locomotive will enable it to displace from five to eight mules and eliminate the cost of three to five drivers.

In this connection it has been found that a storage-battery locomotive may originally be placed to eliminate from six to ten mules but in a few months if one were to ask how many mules would it take to replace the locomotive the answer probably would be ten to sixteen; due to the fact that the operations usually expand quite rapidly as soon as the storage-battery locomotive has become understood and properly handled.

EXTREMELY LOW TYPE BATTERY LOCOMOTIVE

Wherever the veins are thin, the storage-battery locomotive has a marked advantage over any other type of haulage device. This locomotive is only 25 in. high.

The mining type storage-battery locomotive should be simple in construction, accessible, rugged and, above all, efficient. All storage-battery equipment should be so designed as to draw as little energy from the battery as possible for a given amount of work. This must be true at all times and under all conditions so as to conserve the battery energy. Sparkless commutation, great overload capacity, and a maximum torque per ampere also are important factors in the motor design.

Mechanically, the motor must have great strength and durability combined with accessibility and careful elimination of excess weight. The control equipment should be devised with a view to reducing to a minimum the rheostatic losses. To obtain this end combinations of series and parallel groupings of the motors and motor fields should be used. Such economies as may be obtained will permit either the use of a smaller battery or the hauling of more cars per day. In either case there is a lower investment for a given output.

The storage battery is the most important part of the locomotive; it is the power plant of the system and therefore must be properly proportioned for the work to be done. Like the main power plant of any electrical system it represents a problem of capacity and maintenance.

Therefore the storage battery should have sufficient capacity to properly perform its duty cycle and must not have so great an abundance of overcapacity that it may be said that the locomotive is continually carrying around tomorrow's battery. If additional weight is required it may better be in the locomotive frame, where it will add more strength to the locomotive and consist of material far cheaper than battery weight, which must be replaced whenever the battery has run its life.

The conditions under which a storage battery has to operate when used on a locomotive in mining service are different in many respects from those experienced in any other class of work and therefore require that

LOCOMOTIVE WITH WHEELS ON TAPERED AXLE

To facilitate the removal of wheels this locomotive is equipped with wheels on a tapered axle held in position by a locked nut.

the battery be chosen and installed with special reference to these conditions.

It has been suggested that the cells of a storage battery be so mounted on the locomotive that the flat of the plate comes against the direction of motion. The plates being assembled in the jar in this direction no opportunity is afforded for displacement; the inertia of the plates during a violent bump is transmitted through the cushioning effect of the electrolyte against the flat of the plate.

The claim is made that if mounted with the edge of the plates against the direction of motion, the cushioning effect of the electrolyte is lost, the shock is first transmitted to the jar through the connecting post and cell cover, and this may be followed by a hammer blow between the edges of one or more plates and the side of the jar, with resulting broken covers and broken jars. This point doubtless becomes of more importance as the ratio of battery weight to total locomotive weight increases.

The trays in which the cells are mounted should be provided with sufficient partitions so that the cells at the ends of rows will not be subjected to the inertia of cells behind them.

Furthermore, the trays should be thoroughly insulated from the frame of the locomotive, which is accomplished by the use of rugged insulators.

Holes should be provided in the bottom of the battery compartment in order to permit drainage and the break-

PERMISSIBLE STORAGE-BATTERY LOCOMOTIVE

May be used in gaseous mines. Access to the motors and gearing is made easy by rotating the battery box while mounted on the locomotive.

ing loose of any foundations between the tray and the iron of the locomotive, as such formations create leaks which tend greatly to reduce the capacity of the battery available for work.

The determination of the battery capacity represents the most important problem that the mining man must solve before selecting a storage-battery locomotive. This, in fact, is perhaps his only problem after he has determined the advisability of obtaining a storage-battery locomotive for a given work, because the locomotive details of all reputable manufacturers have now become quite generally established along definite lines which assure the many desirable features being incorporated.

The duties of a proposed storage-battery locomotive cannot always be definitely outlined. One of the reasons for this is that the electrical engineer rarely has control over the output of a given section of the mine in which the locomotive is to operate. Another reason is that it frequently happens that mining conditions change materially during the development of a section and even between the time the battery estimate is made

and the locomotive placed in operation. It occasionally happens that when the locomotive is received it is put into an altogether different section of the mine than that considered in the original battery estimate.

Nevertheless it is always necessary to make at least a rough estimate of the duty of the locomotive. In this event if the work divides itself into one definite cycle of operations repeated several times during the day, the calculation of the battery is simplified; but even when the work does not so divide itself a fairly close estimate may be made if the work to be done during the day can be outlined.

In the preliminary estimate of a battery for a storage-battery locomotive it is well to remember certain well-established limits which must be considered. Storage-battery locomotives as a class are designed for speeds about one-half those used on trolley locomotives. A 4-, 5- or 8-ton locomotive runs at about $3\frac{1}{2}$ miles per hour at rated drawbar pull; a 10-ton at $4\frac{1}{2}$, a 15-ton at 5 and a 30-ton at 5 miles per hour at rated drawbar pull. The usual storage-battery locomotive is rated at 80 volts but is usually equipped with a battery of somewhere near 48 cells of the lead type or about 80 cells of the nickel-iron type.

The average tractive effort which must be exerted at the wheels of a storage-battery locomotive to overcome the total resistance of various forms of friction which are present in mine haulage on either level or graded track is 30 lb. per ton of 2,000 lb. In addition to this the tractive effort for each per cent of grade is 20 lb. per ton.

Therefore each section of the haulage system must be separated with respect to the grades encountered and the tractive effort per ton on each section determined. If the load must be taken upgrade the tractive effort for the grade is added to that for friction. If the load is to be taken downgrade the tractive effort for the grade is subtracted from that for friction.

Obviously if a downgrade greater than $1\frac{1}{2}$ per cent is encountered it would permit the load to coast down the grade without the use of power. Since but little of the surplus tractive effort above that required to overcome friction on a heavy grade is available in the next section no allowance is made for this surplus energy. Long trains tend to act as levelers of gradients but in the battery calculations the load is assumed to travel over the system as a concentrated weight.

The tractive effort for the train—locomotive included

BUILT ALONG APPROVED LINES

Much of the standard trolley locomotive equipment has been used in this compact storage-battery locomotive. This is a feature of great importance where capital in repair parts must be kept at a minimum.

ELIMINATES TROLLEY, FEEDER AND BONDING MATERIALS

This storage-battery locomotive works in a large section of a mine where the expense of trolley, feeder and bonding equipment would have been enormous.

—is obtained by multiplying the tractive effort per ton in each section by the weight of the train in tons. Multiplying the tractive effort for the train in each section by the distance traversed in the section gives the foot-pounds of work done by the locomotive in the section.

The energy at the wheels of a storage-battery locomotive is assumed to be $66\frac{2}{3}$ of that taken out of the battery, therefore to determine the foot-pounds of work done by the battery we must multiply the foot-pounds of work done at the wheels by 1.5.

$$\begin{aligned} 1 \text{ hp.} &= 33,000 \text{ ft.-lb. per min.} \\ 1 \text{ hp.-hr.} &= 33,000 \times 60 \text{ ft.-lb.} \\ 1 \text{ watt-hr.} &= 33,000 \times 60 \text{ ft.-lb.} \end{aligned}$$

$$\begin{aligned} &746 \\ &= 2,652 \text{ ft.-lb.} \end{aligned}$$

Therefore dividing the total foot-pounds required from the battery for each section by 2,652 ft.-lb. gives the watt-hour output of the battery for that section. Obviously the sum of the battery outputs per section gives the total capacity required from the battery for a cycle, from which the total daily capacity may readily be determined.

Dividing the total watt-hours by the voltage of the battery (the number of cells multiplied by 2 for a lead cell and the number of cells by 1.2 for the nickel-iron cell) gives the total ampere-hour capacity of the battery.

The watt-hour capacity of all cells can be obtained from any storage-battery manufacturer and the selection of the battery can thus be made to meet the requirements of the locomotive.

Dividing the ampere-hour capacity of the battery required by the ampere-hour capacity per positive and negative couple in the particular type of cell under consideration will indicate the number of positive plates in the cell to be used. The number of positive plates times 2 plus 1 gives the total number of plates in the cell.

The ampere-hour capacity per couple for any type cell easily may be obtained by dividing the ampere-hour capacity of a 21-plate cell by 10. For example, a 21-plate cell of 350 amp.-hr. capacity has a couple capacity of 35 amp.-hr. To compare different types of cells it is necessary first to put each type of cells on the same hour discharge basis. To illustrate the simplicity of this method of calculating the necessary battery capacity for a storage-battery locomotive let us assume the following problem:

A haulage system consists of 900 ft. of level track

GATHERING WORK IS DONE QUICKLY

Dependability is of prime importance to the mine operator. Placing the cars quickly maintains a high morale among the miners.

and 1,200 ft. of 1.4-per cent grade against the loaded train. The locomotive weighs 5 tons, the loaded trailing weight is 18 tons and the empty trailing weight is 7 tons; 25 round trips per day.

The complete cycle may thus be divided into four parts:

First section—23 tons on level for 900 ft.

Second section—23 tons on upgrade for 1,200 ft.

Third section—12 tons on level for 1,200 ft.

Fourth section—12 tons on downgrade for 900 ft.

The tractive efforts are as follows:

First section—30 lb. per ton.

Second section— $30 + (20 \times 1.4) = 58$ lb. per ton.

Third section— $30 - (20 \times 1.4) = 2$ lb. per ton.

Fourth section—30 lb. per ton.

Total ft.-lb. at the wheels:

First Section— $30 \times 23 \text{ tons} \times 900 \text{ ft.} = 621,000$

Second section— $58 \times 23 \text{ tons} \times 1,200 \text{ ft.} = 1,601,000$

Third section— $2 \times 12 \text{ tons} \times 1,200 \text{ ft.} = 29,000$

Fourth section— $30 \times 12 \text{ tons} \times 900 \text{ ft.} = 324,000$

Total ft.-lb. at the wheels per cycle 2,575,000

$2,575,000 \times 1.5 = 3,862,500$ ft.-lb. battery output.

$3,862,500 \div 2,652 = 1,458$ watt-hours or cycles.

$1,458 \times 25 = 36,450$, total watt-hour output of the battery per day of 25 round trips or cycles.

Assuming a battery voltage of 96 then the ampere-hour capacity of the battery will have to be 370.

If the ampere-hour capacity per couple (consisting

LOW TYPE LOCOMOTIVE BECOMING MORE NECESSARY

The mining of thin veins is increasing daily. More efficient and safer methods of mining are attained wherever the storage-battery locomotive is properly applied.

of a positive and a negative plate) is 34, then the number of couples must be 11, or 23 plates per cell.

If the ampere-hour capacity per couple is 37, then the number of couples must be 10, or 21 plates per cell.

This simplified method of the battery calculation may be readily used to determine the practicability of a storage battery locomotive for any given amount of work and should eliminate the uncertainty that often exists in the mind of the manager because the calculations may be easily understood and verified.

Further Light on the Use of Carbon Dioxide in Fighting Mine Fires

Difficult to Check Fire When Rock Is Hot—Clay for Surface Cracks—Cement and Paint for Stoppings

IN THE discussion of the paper by Charles L. Jones, of the Mellon Institute of Industrial Research, Pittsburgh, Pa., delivered at the West Virginia Coal Mining Institute at Clarksburg, W. Va., June 12, and printed in *Coal Age* of July 5, the author said that carbon dioxide might not always be effective in the fighting of mine fires, especially where the fire has burned for years in a mine having thick cover.

Heat is conducted from mine fires through the adjoining strata, and it is to this conductivity, however slow in action it may be, that the dissipation of heat in the early stages of a mine fire is due. Where, however, a fire has burned for years a heat gradient is developed in the rocks above and below the coal seam, and the high temperature of the rocks for a considerable distance from the fire will limit the rate of heat transfer, for the rocks will be insulators rather than conductors.

Consequently in such a case the cooling effect of the agents used to fight the fire will have to be relied on to lower the temperature in the fire zone. As none of the agents from a fire of this character can pass outward we can have little hope of extinguishing the fire with carbon monoxide or any other agent yet known wherever these severe conditions must be confronted.

Assuming that no further heat is generated by the fire after sealing, the rate at which the rocks will cool will be exceedingly slow. As proof of this statement Mr. Jones cited the conditions which prevail in the pumping of deep deposits of sulphur by means of the injection of steam. In some instances prolonged working of these deposits by this method has so extensively established the heat gradient that upon cessation of operation years would be required to cool the rocks to their original temperature.

On the other hand, where the overburden is comparatively light and yet solid, a fire may be extinguished even though it has burned for years, providing, of course, it can be sealed off properly. The overburden was light above the Bitner mine of the H. C. Frick Coke Co., of Pennsylvania. No doubt this factor was instrumental in shortening the time in which the carbon dioxide extinguished the fire. Though these conditions thus proved favorable to carbon-dioxide extinguishment they were not propitious for the fighting of the fire with water, little progress being made till carbon dioxide was introduced.

On being asked by W. E. Fohl how surface breaks were sealed, Mr. Jones replied that the plastic clay

MINE FIRE AT RED ASH COAL CO. MINE NEAR WILKES-BARRE

A fire in a shallow seam, that indeed outcrops in places and has partly been stripped, is now burning over a large area and extending its ravages rapidly. It has been burning so long that the roof rocks are in places white hot and metamorphosed as a result. Bad crevices have opened in every direction, letting in air. Unfortunately the ground is so hot that in places the surface cracks could not successfully be mudded tight. The fire has all the conditions that make extinction difficult.

forming the surface soil was tamped into the cracks that appeared on the surface. These were not systematically and thoroughly closed until after introduction of gas had been commenced, and it was stated that attention to this point might have prevented the loss of some of the carbon dioxide which was fed to the fire. The labor required is small when it is compared with that required in the direct method of fighting the fire. Forty men working five days completely closed off surface breaks by the tamping process.

Mr. Fohl said that he knew of a case in Ohio where gas lines were endangered by a fire in outcrop coal. This fire was successfully smothered by sealing the crevices with tamped clay.

LIKE SHIPS, MINES MAY KEEP GAS ON HAND

Reference being made in the reading of the paper to the fact that the steel cylinders for holding carbon dioxide cost approximately six times the value of their contents, Mr. Fohl asked, What is the life of the cylinders? Mr. Jones replied that the life is limited only by the corrosion that occurs on the exterior of these containers.

The demand for carbon dioxide for soft drinks is 90 per cent of the total production, and as this demand is seasonal, much of the manufacturer's capital is tied up in these cylinders and they return to the factory only slowly. The Interstate Commerce Commission requires that these containers be tested periodically. Ships which keep liquefied carbon dioxide in readiness to fight fires in their holds buy the cylinders outright. It may be possible in the future that isolated mines in seams susceptible to frequent outbreaks of fire will be provided with liquefied carbon dioxide in cylinders, the coal companies buying these containers outright.

In answer to a query by Mr. Fohl as to the cost of fighting the fire with carbon dioxide, Mr. Jones stated that 230,000 lb. of inert gas was used at the Bitner mine at an expenditure of about \$15,000, that being the cost of the gas alone. This is approximately one-tenth of the whole cost of fighting the fire, for much money was expended in the direct method prior to the use of carbon dioxide.

With the knowledge now on hand, derived from experiences in fighting the fire in the Bitner mine, that expenditure undoubtedly could be cut considerably.

This cost is remarkably low in view of the fact that the void in the fire zone had a volume of about 2,000,000 cu.ft.; that 200 men previously were employed to fight the fire by the direct method; and that about 2,000,000 gallons of water was pumped into the fire zone each day. Once the fire is sealed off, few men are required to administer carbon dioxide to the atmosphere in the fire zone.

At the Bitner mine the carbon dioxide was fed through four boreholes. J. B. Hanford asked if the gas could be fed directly through stoppings. To this Mr. Jones replied that it was inconvenient to transport the cylinders underground. One plan suggested was to feed the gas through a water line which already was in place; but because ideally located boreholes were already drilled it was decided to administer the carbon dioxide through them.

Someone in the audience suggested that this scheme would not be practicable where the overburden was thick, but Mr. Jones pointed out that it was entirely practical to introduce the gas through any sort of pipe whether used for air or water, thus relieving the situation.

Frank Haas wondered what becomes of the heat generated by the fire. If the temperature is high enough, even though there is no fire, when the fire zone is opened up (even though after a rest period of ten months or more), the inrush of air is sufficient to cause the heated coal to burst again into flame.

In answering his question Mr. Jones asserted that few men realize the value of the conductivity of adjoining strata as a means of dissipating heat in the early stages of a mine fire. The continuance of heat under conditions described by Frank Haas, for periods of ten months or more, he said, was due to just enough air leaking in to support the fire, which in reality was never entirely extinguished. Instead of breathing air the fire should be made to breathe carbon dioxide during the rest period before the stoppings are torn out.

Due weight should be given to the ability of water to lower temperature, Mr. Haas remarked, adding that he believed this property of water of more value than the conductivity of adjoining strata. Mr. Jones admitted that water lowered the temperature more quickly than the adjacent measures, but he believed that as the cooling action of carbon dioxide is inconsiderable and as water found its way to only 25 per cent of the area

ANOTHER VIEW AT THE GREAT RED ASH FIRE

In this mine fire the heat gradient is broken by the fact that the knife blades of coal in the superincumbent rock are burning. The rock shown is in places white hot, though unfortunately the illustration cannot bear witness to that fact. The rock becomes, like shale tile, strongly resistant to the passage of heat.

of the fire in the Bitner mine it was not reasonable to discount the heat conductivity of adjacent strata as a means of lowering the temperature of the fire zone, for its effect must have been appreciable.

During the discussion Mr. Jones made mention of the fact that a solid brick wall is not impermeable to air. Prof. A. C. Callen wanted to know what quantity of air would travel through such a wall in a given time when only a slight difference in pressure existed inside and out. Mr. Jones said tests have been made which show that a small chamber closed by solid brick walls which are plastered on the inside may change atmospheres in three hours. He suggests that if a coating of tar paint were applied to the brick stopping it might lower the volume of the air thus transpired. Incidentally, the Consolidation Coal Co. uses gunite for this purpose.

It is interesting to learn that liquefied carbon dioxide is now being used by the National Mining Co. to fight a fire in a refuse pile at one of its mines. Smoke from this fire is a nuisance to the nearby mining town, and the slate pile is fairly close to crop coal. Consequently an experiment is being conducted to attempt to put out the fire by the use of carbon dioxide. The same theory is recognized in this case as is honored underground, namely, that the heat conducted away from the pile must equal the heat generated if the fire is to be put out. Therefore carbon dioxide may be administered to the seat of the flame in quantities sufficient to disturb the heat balance. Results achieved thus far point to abatement of smoke and lowering of temperature.

In conclusion it may be said that there are wonderful possibilities in the use of carbon dioxide in the combatting of fires in stored coal. Apparently the ground has only been scratched in making the first successful application at the Bitner mine. If carbon dioxide is successful in fighting a fire in a mine-refuse pile, it will be equally as effective in fighting fires in our stockpiles of soft coal. We may later learn that it can be used periodically, and at no great expense, to check temporarily the oxidation of coal for periods sufficiently long to establish outside temperatures in the middle of a stockpile. This, if not too expensive, would solve one of our greatest coal problems, namely, industrial coal storage.

Why Not Scrap the Davy "Safety" Lamp?*

BY J. W. PAUL AND A. B. HOOKER†

THERE was a time when any suggestion that the Davy flame (safety) lamp be discarded would have evoked unlimited criticism. That time, however, is past. Investigations both here and abroad have shown conclusively that the Davy lamp does not have the necessary factor of safety against ignitions of mine gas, and Great Britain, the last stronghold of the Davy lamp in Europe, has eliminated this lamp and substituted safer types. In the United States there are companies which still use the Davy lamp in spite of all that has been said and published as to the dangers connected with its use.

Recently the purchasing agent of an anthracite company requested the Bureau of Mines to pass upon the safety of some brass gauzes for use in a shielded Davy lamp. This is an ordinary Davy safety lamp equipped with a circular brass shield that is attached to the lamp posts. This shield extends about one-half way around the gauze and one-half of the gauze height. The main purpose of the shield is to prevent the extinguishment of the lamp by a sudden increase in the velocity of the air.

BUREAU TRIED BOTH BRASS AND STEEL GAUZES

The brass gauzes submitted for this test represented two grades of brass—one yellow and one red. The analyses of these brasses were not determined. Two shielded Davy lamps that were submitted for the tests each had a steel gauze. These steel gauzes also were tested. Tests were made in horizontally moving mixtures of Pittsburgh natural gas and air at velocities of 400 to 1,000 ft. per minute. The gas percentages used were 7, 8.6 and 11. Tests were made with the lamp shield in two positions relative to the lamp and to the direction of flow of the gas-and-air mixture. In one position the shield was between the gauze and the flow, as normally used. In the other position the shield was on the downstream side of the lamp. The tests were continued until one or more failures or gas explosions had been obtained with each of the six gauzes. The results of these tests may be summarized as in Table I.

TABLE I—PERFORMANCE OF DAVY LAMPS
IN GAS AND AIR

Total number of tests	24
Number of tests in which ignition occurred.....	14
Number of tests in which rupture, or melting, of the gauze occurred	2
Lowest velocity (feet per minute) of air mixture at which ignition occurred	800
Highest velocity (feet per minute) of air mixture at which no ignition occurred.....	900

The Davy lamp failed in velocities of 800 to 1,000 ft. per minute. The highest velocity in which the lamp did not fail was 900 ft. per minute and under the following conditions: (1) Lamp equipped with a red brass gauze in not more than 7 per cent gas mixture; (2) Lamp equipped with an old, considerably oxidized red brass gauze in not more than 8.6 per cent gas mixture and the shield in its normal position between the lamp gauze and the air current. No ignition of the external mixture occurred in velocities below 800 ft. per minute.

The brass gauzes that failed by rupture failed at velocities of from 100 to 200 ft. per minute lower than the steel gauzes which failed without rupture. This,

*From Reports of Investigations, U. S. Bureau of Mines.

†Chief of coal-mine investigations and assistant electrical engineer, respectively, U. S. Bureau of Mines.

however, was not true with the red brass gauzes, which failed at practically the same velocities as the steel gauzes and without rupture. Gauzes became heated to redness in velocities as low as 400 ft. per minute. Though normally this might not be considered dangerous, conditions might easily arise that would greatly increase the danger, as for example—there might be some foreign substance such as oil on the gauze, or the lamp flame might strike the gauze so that the heat would be localized over a small area; also there might be contact with clothing or dry brattice cloth, which would ignite external gas.

Some tests conducted in Great Britain and confirmed by early tests of the Bureau of Mines, have shown that a sudden concussion wave in the air produced by blasting coal or rock will often cause the flame of the burning gas within the Davy lamp to pass through the gauze and ignite external gas, and this danger is accentuated when the gauze is heated.

The location of the heated gauze area through which ignition occurred seemed to depend upon the position of the shield, the action of the wick flame, the quantity of oil (fuel) that was distilling from the burner and the distribution of the flow of gas through the gauze. If the shield was between the gauze and the current, the gauze usually was quite evenly heated on the downstream side, yet sometimes, due to the playing of the wick flame against the gauze and to burning oil around the burner,

the gauze would become heated over a small area at the lower downstream side of the gauze. If the shield was on the downstream side, the failure occurred on the downstream side of the gauze at a point just above the shield and below the gauze cap.

A comparison of the behavior of the shielded Davy lamp with that of an unshielded lamp tested during a previous investigation showed that the shield offers some protection to the gauze. However, the test results as a whole show that any type of Davy lamp is an unsafe lamp for use wherever gas is likely to be encountered. The Bureau of Mines does not approve a flame safety lamp as permissible for use in gaseous mines unless it is equipped with double gauzes, a bonnet and a magnetic lock and has been proved by tests to be safe in velocities up to 2,500 ft. per minute. Great Britain, the country in which the Davy lamp was first used, recognized the danger connected with its use and has substituted safer types. The report of the British Department of Mines for 1918 shows that of 590,185 flame safety lamps then in use in the United Kingdom, only four were Davy lamps. The Department of the Interior learns from reliable sources that there are still about 8,000 Davy lamps in use in the anthracite mines of Pennsylvania. It is believed that every Davy lamp in use represents a possible hazard to life and property and that all of these lamps should be scrapped in favor of safer types.

Motive Power Makes Traveling Car Dump Operate Successfully

NO NEW IDEA is the traveling car-dump carriage. It has been found for many years on rock dumps. As usually made, it looks highly serviceable, yet it performs abominably. Either three or four men operate it with some celerity or two men strain at it almost in vain and get less done than with an ordinary gallows dump. The difficulty is to push the heavy carriage and car over a track that cannot be kept up to grade or in alignment because the dump on which the track rests always is moving. Another problem is to keep the track on the deck and that at the deck at such a steady vertical interval that it will be easy to load cars on the carriage and take them off, and even when they are right in this relation it may be difficult to push the carriage round to just such an angle as will permit of docking.

Though few seem as yet to have realized it, almost all this clever device needed was *power* to fill all its various functions, each of which it was well designed to perform. It needed power for embarking, transporting, and disembarking, and given this its operation would be easy. Especially did it need power for transporting for as soon as it is provided with locomotive power, it is easy and permissible to make it heavy enough and thus have the dump so mechanically constructed that its revolving will be easy. When locomotive powers are afforded to the carriage, moreover, it is a matter of small concern if the dock is placed sufficiently far back that it will rest on a piece of dump that has settled or even on solid ground so that the embarking and disembarking will be certain and accomplished without strain. As for the dumping, that is readily performed if gravity is allowed to help. Returning the car to the horizontal, however, in that case is more difficult, but the energy of transportation can be made to do this, as will be seen later.

The Bloomsburg Locomotive Works, of Bloomsburg, Pa., provides a car-dump carriage with a motor equal to propelling the sturdy vehicle and car along an uneven track at five miles per hour over a grade of 4 or 5 per cent against the load. A sag from a level grade of only about 3 or 4 in. in 6½ ft. makes a grade of that size, but that depth of sag is not likely to be exceeded in a 6½ ft. distance. The wheelbase of the carriage is 6 ft. 5¼ in., giving the car reach enough so that it does not make too much of little sags in the road. The carriage has good journal bearings with an oil cellar and eight coil springs—two for each journal. The gage, of course, varies according to need and may be 36 in. or less.

In the straight-ahead dumping car, of course, no revolving mechanism is provided. When the controller is thrown the carriage goes forward under its own power,

FIG. 1—STRAIGHT-AWAY CARRIAGE DUMP IN OPERATION

Proceeding under its own power this carriage-dumping platform takes the car from the wharf or pier to the end of the rock dump, where it is allowed to tip up and discharge its load, the gallows frame lifting the endgate. The ability to move itself over adverse grades of 4 per cent makes practicable what is a somewhat difficult method of dumping when attempted by the brawn of a gang of day laborers, unaided by electric power.

FIG. 2—ROCK DISCHARGES, DUMP RETURNS TO PIER

When the platform tips it causes an I-beam in the rear of the car to project. The platform remains tilted until it reaches the wharf which drives in the I-beam, brings the platform back to the horizontal and in doing so kicks back the car, which runs on to the pier as a result.

up or down hill, to the end of the dump. Here the platform is released. It tips up and in doing so thrusts back an I-beam, which it thus causes to project 3 ft. behind the carriage. When as a result of the tip the car is discharged the platform does not drop back into place but remains tilted until the carriage has under its own power been returned to the dock. In going to the pier the I-beam strikes first, rights the platform, allowing the car to kick back and so pass from the carriage to the dock.

As the gradient on this dock inclines toward the carriage it is easy to load the car onto the locomotive truck by gravity. It has been noted that it is unloaded by the same simple means. One of these straight-ahead car-dump carriages can be seen in daily service at the mines of the Wyoming Anthracite Co., Shickshinny, Pa. It is asserted that one man can handle the carriage, though its weight is 6,850 lb., and it will carry 18,000 lb. A revolving car-dump carriage also is made whereby rock can be dumped in all directions with equal facility. By changes in the old car-dump carriage, which bring it into line with our modern power-driven machinery, and by some adjustments well adapted to its new characteristics, it has been so greatly improved that instead of two to four men being needed to operate it, one is enough and he does the work rapidly and without strain.

FIG. 3—REVOLVING DUMPING CARRIAGE

Here the platform has been revolved a full right angle. The whole top of the carriage does not revolve, only the front part. The propulsive machinery remains in the normal position on the truck prior to, during and after dumping.

Lightening Labor of Upraising Shaft

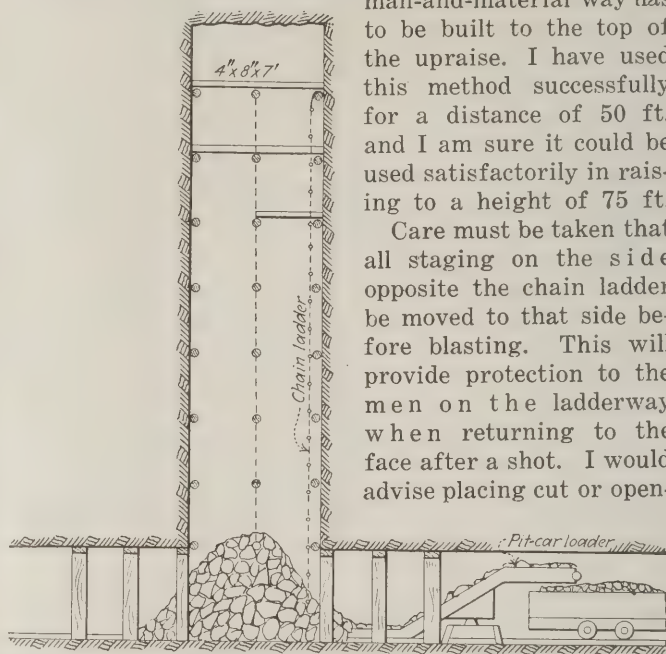

By J. W. POWELL

Shaft Contractor, Charleston, W. Va.

IF A SHAFT is excavated as shown in the illustration not only is time and material saved but some of the danger of this class of work also. All the material is loaded out as the shaft is driven upward and staging or platforms are provided on which the men work. No

man-and-material way has to be built to the top of the upraise. I have used this method successfully for a distance of 50 ft. and I am sure it could be used satisfactorily in raising to a height of 75 ft.

Care must be taken that all staging on the side opposite the chain ladder be moved to that side before blasting. This will provide protection to the men on the ladderway when returning to the face after a shot. I would advise placing cut or open-

ROCK REMOVED AS FAST AS BLASTED FROM UPRaise

Care is taken to shoot rock so that it has a free fall on a side of the shaft remote from the chain ladder. The working platform is moved to the right side when blasting.

ing-up shots on the left rib and that care be taken to see that this cut is out clean before blasting the rest of the round. By using this method of drilling and blasting all material on the right rib is blown toward the left rib. This reduces the chance of blowing out the timbers below, which is likely to happen where the wedge cut is blown in the center of the raise, for the whole force of such a shot is exerted downward.

THE UNITED STATES is one of the largest coal-land owners in the world, according to information collated by the Department of the Interior. The government also owns immense tracts of oil shale besides important deposits of phosphate, potash and other salts. At the present time the Interior Department supervises between 30,000,000 and 40,000,000 acres of public coal lands through fifteen states and while mining on private coal lands overshadows mining on public lands there is every probability that in the future the situation will be reversed. Coal is now being produced from government lands in eight states and there are more than one hundred mines. In addition the government has one phosphate lease, one oil-shale lease and four potash leases on public lands.

ADDED FUNCTIONS SHOULD BE MULTIPLIED.—In a letter, W. A. Neff, of M. A. Hanna & Co., calls attention to the printer's error on page 1005 of the issue of *Coal Age* of June 21. The formula should be

$$G = \frac{(W_L \times R_L) - (W_E \times R_E)}{20(W_E + W_L + 2M)}$$

Old-Time Ohio River Coal Traffic Is Revived

Fuel Fleets from Kentucky and West Virginia Fields Grow as All Freightage Increases After Worst River Year in History—9-Ft. Stage Near—Machinery Replaces Shufflin' Coal Passer

BY A. W. WILLIAMS
Louisville, Ky.

ONCE more the black smoke of coal traffic is beginning to float over the valley of the Ohio. River coal shipping of the "good old days" from Pittsburgh to New Orleans may in great measure revive. While the tremendous volumes of Pittsburgh coal that once moved by inland waterways may not be equalled in 1923, yet there is a distinct movement of West Virginia, eastern Kentucky and western Kentucky coal toward the Ohio and its tributaries. Big coal consumers are becoming more numerous along the rivers, boat building is reviving, coal producers are acquiring considerable fleets, and great tows of coal such as have not been seen since 1914 are beginning to move.

The whole freight traffic of the Ohio is swelling as a result of the improvements the government has made in the river in recent years. Today enthusiasts for Ohio River traffic are morally certain that the government is going to provide by Jan. 1, 1925, the long-heralded "9-ft. stage" which, by means of locks and dams yet to be built around the falls and shallows near Louisville, Ky., will guarantee sufficient depth for year-round heavy shipping. Recent dispatches from Washington indicate that a considerable portion of the 1923 congressional appropriation of \$56,000,000 for rivers and harbors will be used on the Ohio. If \$15,000,000 is devoted to the "9-ft. stage," they say, coal, oil and steel movement by water will be unthrottled at last. The immediate development of the "9-ft. stage" will be on the Ohio down to Louisville, thus making that city a great transfer point. The stage is to be extended southwest to the Mississippi later.

Washington on March 27 announced plans for the creation of government barge lines operating on the Ohio, Monongahela and Mississippi rivers. Secretary Weeks said that the ultimate aim was for an inland service connecting at New Orleans with coastwise service. Incidentally the government has recently taken up its river equipment which had been operated by the Edward F. Goltra interests, of St. Louis.

Until the past year or two rotting steamboats and barges were to be had for a song on the Ohio River, but today the old equipment has been pulled from the mud flats and is being reconditioned as rapidly as possible. Shipyards are all rushed, and turning out principally steel boats and barges. Some houses would like to purchase steel barges, but can't get deliveries, and are taking the less desired wooden boats once so familiar in the coal trade but which have fought a losing battle with bigger steel barges.

In all this activity coal shippers are taking a keen interest. While it is easy for them to hark back in memory not so many years when the coal traffic was in its heyday, it is easier still to look at the statistics of recent years and realize that coal traffic through Louisville, for instance, has amounted to little and has been getting less and less. Since the war, coal movement through Louisville dropped from 89,000 tons in 1918 to 39,534 tons in 1922, according to that city's Board of Trade figures, with a steadily descending curve through those years relieved only by a 65,000-ton "peak" in 1920.

The season just past was the worst that the inland transportation companies on the Ohio River have ever experienced, as the river was lower than at any other time in twenty years. For months only the smallest of gasoline packets were able to operate, and these spent much of their time on sand bars. In the upper Ohio

NOTE—The headpiece depicts a coal-handling plant on the Kentucky River. The digger boat in the center background is unloading a coal barge into cable cars on an incline track running up the bank to a coal elevator behind the trees. Kentucky River equipment on the average is smaller than that on the Ohio.

COAL INCLINE FROM RIVER TO ELEVATOR

The crane on the floating "digger" lifts coal from barge to hopper from which it drops into 1-ton steel cable cars which transport it up the incline to a dump in the elevator.

River, coal from the Kanawha River section of West Virginia was brought to Cincinnati for transfer to rail and for local demand. Considerable tonnage was moved by manipulation of locks and dams, but ten tows were aground at one time when the river ran out from under them. The Kanawha fleet had plenty of trouble in reaching Cincinnati, while from Cincinnati to Louisville it was impossible to move much tonnage.

It is difficult to get accurate figures on the shipping of the "good old days," but the movement through the "port of Louisville" was many times larger than that of any other recent year. Captain M. J. Sebolt, for twenty years with the old Monongahela River Consolidated Coal & Coke Co., which operated a number of towboats and hundreds of barges, with digger boats for unloading and pump boats for rescue work at many points, says he put 1,400 coal boats of 1,000 tons each and 600 barges through the canal or over the falls at Louisville in a single year. All of this went south, some of it reaching New Orleans.

That company's equipment all bore "R. C." in great letters. The "R. C." stood for "river coal," but as the Monongahela was in practically complete control of the river movement of coal, the company became known as the "Combine" and the letters stood, in most minds, for "River Combine."

A few years ago the old "Combine" took some great tows south. Louisville was a vital point, due to the Falls of the Ohio and three bridges, one of which spanned the rapids, leaving a relatively narrow passageway for handling big tows. At high water there is not much fall to the river, and tows were taken over the falls, while at lower water they were broken above

Louisville and locked through the canal, to be made up again below. Generally all large tows were broken and taken over the falls in smaller units.

Frequently in handling a large tow over the falls a powerful small tug would be lashed across the head barges, to aid the big pusher or towboat get through the bridges. Some of the largest towboats seldom came above the locks or falls. Smaller boats brought fifteen- or thirty-piece tows to Louisville, loading fifty pieces on the Sprague, below that city. The Sprague was by far the largest and finest towboat on inland rivers. At Cairo, Ill., where the Ohio joins the Mississippi, the Sprague would pick up fifteen to twenty additional pieces, and go south with 65,000 to 70,000 tons of coal besides a couple of fuel boats containing her own needs.

There were numerous other big boats which carried thirty or forty pieces. The Raymond Horner, the W. W. O'Neil, the Duquesne, the Oakland, Iron Age, Alice Brown, Harry Brown, Sam Brown, John A. Wood, J. B. Finley, Joe B. Williams, F. M. Wallace and the Gleaner were among the big boats which brought coal to Louisville and carried it south. The Williams, Finley, Sprague and Wallace were among the big fellows that were loaded up below Louisville for the heavy trips. Many of these boats were burned or dismantled years ago. Some are still in operation. The Sprague is towing ore on the Red River of the South.

What has become of the great river traffic in coal? is sometimes asked by the man who has no knowledge of the subject. First of all, the railroads made competition keen, but could not hurt the companies that were hauling their own coal. Rail competition did cut down profits, however. Then the war came along and demand for fuel in the Pittsburgh district became so heavy that Pittsburgh coal was all needed at home, and there wasn't much available for movement elsewhere. The "Combine" began selling its boats and equipment, dropping out of the "coal by river" business.

Handling coal by river could be done profitably when everything went well. There have been spells, however, when luck was against the coal transportation business. Low water in summer and ice in winter are bad. Then there are the falls at Louisville, bridges at various points, and in the lower Mississippi tropical storms during which the wind reaches a high velocity sweeping the flat country. In high water a boat occa-

PARALLEL INCLINE UNLOADING PLANT

Standard railroad cars can be run alongside the barges so that the "digger" transfers coal by clamshell, direct from boat to trains thus eliminating one or more handlings in the transfer of fuel from river to rail.

THE C. F. RICHARDSON, PRIDE OF THE LOWER OHIO RIVER

This \$350,000 towboat, built a year ago for the West Kentucky Coal Co., is designed to handle immense tows of thirty or more 1,000-ton coal barges, or enough coal to fill at least ten trains of sixty cars each. Tremendous power boats like this put river coal traffic on a scale so big that great economy is secured.

sionally has gone aground while trying to keep out of the heavy current. Sometimes, in high water, they stuck in the mud of nearby fields and stayed there high and dry until the next flood floated them or they fell apart.

The big operators of the early days figured that the only way to make money in moving coal was to handle enormous units. In the upper river great units were troublesome because of the narrower river and lower bridges. After they brought coal several hundred miles to Louisville, however, the big boats were given as many pieces as they could carry for the long trip south.

A coal barge is well constructed and can stand a good deal, but it cannot stand being jammed against a bridge pier or into the bank. A wooden coal boat was a flimsy sort of creation, short-lived at best, and easily wrecked. In the old-fashioned boats it was necessary to keep steam syphons going day and night to prevent sinkage. The sinkage of one barge or coal boat sometimes meant that before lines could be cut a number of other pieces would be pulled under.

It is reported that the famous old Sprague on one occasion lost her entire tow of some fifty pieces. Due to the size of her tows the Sprague used a steel line and a very intricate system of putting her tow together. If a barge sank it was impossible to cut loose the steel lines, but if a hemp rope had been used on such huge tows the strain of flanking a tow around the bends might easily have broken the rope. The Sprague was an unfortunate boat and her operation costs were high. Her losses through wrecked boats and barges and coal sunk in the river ran into enormous sums. In the lower Mississippi with a good stage of water she was ideal, but in flood stages or when a tropical storm broke she needed a lot of luck.

Bad luck in handling big tows along with the fact that the "Combine" lost its desire to sell coal to the Southern markets resulted in river movements slowing up. Then came the great winter of 1917-1918, when heavy ice broke loose throughout the valley of the Ohio. The great jams wrecked boats, barges, towboats, pump boats and packets until there was little equipment left on the river. The finest of the river boats were wrecked. Ice at Cincinnati crushed the City of Louisville and the City of Cincinnati, to two fine "white collar line" mail, passenger and freight packets of the Louisville & Cincinnati Packet Co. Equipment was swept out

of the mouths of various smaller streams, where it had been placed in winter harbor for safety. The entire Ohio valley was strewn with wreckage of river equipment. Hundreds of pieces of equipment were destroyed.

That checked river operations for the time being, but capital once more sees the opportunity in river transportation. River workers are not organized or unionized, and freight rates can always be held at well under the rail rates of transportation, which promises to stay high for years as a result of the rail-labor situation. This means that river transportation cannot be throttled easily by rate cutting on the part of the rail carriers, while at the same time the river carriers help to prevent advances in rail rates.

With river shipping coming back it is natural to see big organizations developing river-freight and coal-handling facilities. One of these is the Inland Waterways Co., a two million dollar corporation of Louisville, Ky. Included in its directorate are found James P. Barnes, of the Louisville Railway Co. and Louisville & Interurban R.R. and also Harry Reid, of the Interstate Public Service Co., the great Insull organization, operating interurban lines from Louisville north to Indianapolis and over a wide stretch of country.

The Louisville-Interurban lines can distribute coal in cars to many suburban towns and plants as well as to plants in Louisville. Between the steam and electric lines the company figures to be able to distribute river coal after it reaches Louisville to all industries there, and will also operate a big retail elevator, and perhaps two, to handle less than carload deliveries.

The company also owns 2,000 acres of coal on the Kentucky River at Beattyville, Ky., far across the state in the southeastern coal fields. It has developed one mine, with one drift opening from which coal is moved on an incline to a river tippie. This mine has a maximum capacity of 450 tons a day and averages 300 tons, but it is to be enlarged as soon as the market warrants.

River men constantly point to the cheapness of river shipping over railroad transportation. Patrick Calhoun, Sr., president of the Inland company, stated that his concern has handled 53,000 tons of general cargo from Beattyville on the Kentucky River to Louisville within the past few months, at an actual cost to the company of 94c. a ton, as compared with a freight rate of \$1.76 a ton average on the same hauls by rail. The 94c. does not include interest and depreciation, however.

The coal tow from Beattyville to Louisville is 320 miles, including 260 miles to the Ohio and 60 miles to Louisville. From Louisville to the Kanawha River in West Virginia is a distance of 337 miles. Movement in the Kentucky River is slow due to the large number of locks, while Ohio River movement is faster due to a wider stream and larger locks. Neither of these hauls is much shorter than the former haul to Louisville from Pittsburgh of 604 miles. The total haul from Pittsburgh actually was 634 miles, for the tows were picked up about thirty miles above Pittsburgh.

This means that coal can be brought into Louisville from either the Kentucky River or the West Virginia (Kanawha) district at much less cost than from the Pittsburgh district. The Kentucky mines are young and productive and the West Virginia district is tremendous. In each case there is no large local consuming market to interfere with big-scale shipping down the river.

Another company which is making history in river transportation is the West Kentucky Coal Co., Paducah and Sturgis, Ky., of which Charles F. Richardson is the active head. This company during the last few years has been handling a great deal of its coal by river and is steadily enlarging its river movement. Today it is handling from 300,000 to 400,000 tons of coal annually from its mines in western Kentucky, near the mouth of the Ohio River, to Memphis, St. Louis and other points.

The company can get a daily output of 7,500 tons from its string of mines. A good deal of this is borne to market by water. In the Sturgis territory four mines in Union County are five miles from the river loading tipple at Caseyville. Six mines in Webster County are 14 miles from the river. Three 100-ton locomotives and 150 drop-bottom coal cars are in service between the mines and the river tipple, which has a capacity of 100 tons an hour. The river haul from Caseyville down to Memphis, a great distributing point for river-and-rail coal, is 350 miles.

Just how much the company saves by shipping coal in its own boats to Memphis is not revealed. Says President Richardson, smiling: "There are some things we are not telling. That is one of them. However, it stands to reason that we are making a fair margin over all-rail haul or we would not keep on investing so heavily in river equipment. River haul saves us money and

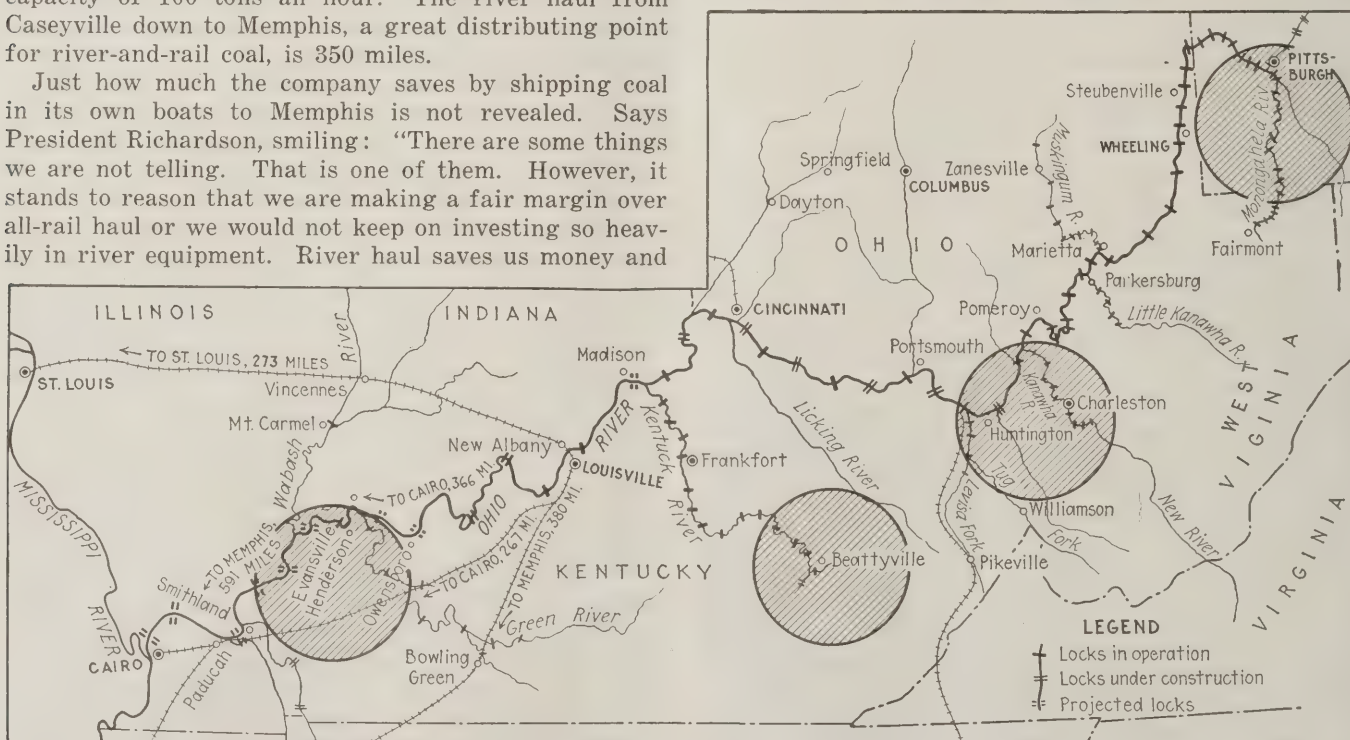

it sometimes gets us a market we could not otherwise reach."

The company handles coal as far South as Natchez, Miss., and plans later to go to New Orleans, as it increases its river market and its equipment for handling. The company formerly towed to Donaldsonville, La., but when the Texas Pacific R.R. decided to burn oil instead of coal in its locomotives the Donaldsonville haul was abandoned.

In its river equipment this company has 175 barges and is building twenty more, of which fifteen will be of wood and five of steel. It has twelve pump boats to keep barges free of water and four steam coal diggers at unloading and transfer terminals such as Memphis, Paducah and Rose Clare, Ill. The company has thirty flats and is adding three. It operates three large steam towboats, two steel hull steam tugs and one wooden-hull steam tug. The Gleaner, one of the company's big boats, is out of commission getting a new steel hull. The Reaper, another big boat of old-time fame, was sold after the purchase of the Charles F. Richardson, one of the largest and finest towboats on the river.

The Richardson is handling thirty-piece tows composed of 600-ton barges to Memphis, also carrying one fuel barge for her own use. She can carry 30,000 tons at a clip, but the company has been short of empties and hasn't been giving the big steamer a full load.

This company operates its own barge-building plant at Paducah and makes most of its own repairs to river equipment. The new steel barges which it is having built by the American Bridge Co. for autumn delivery will be 26 x 175 ft., 11 ft. deep, and will hold 1,000 tons each. The coal company is building the fifteen new wooden barges in its own plant. These will be 26 x 135 ft., 8½ ft. deep, known as the standard 600-ton Mississippi River barge. It also recently built a new

MAP OF THE OHIO RIVER AND ITS COAL SHIPPING TRIBUTARIES

The four circles roughly indicate the mining fields where most river coal originates. The lower three fields just now are displaying especially lively interest in the reviving

river trade. From the western Kentucky field coal goes as far south as Memphis for transfer to rails but may once more penetrate further south. Coal from the field

centering at Beattyville, Ky., is moved by river to Louisville for little more than half the rail rate in spite of the time needed in passing the many locks in that river.

hull for a steam digger at Memphis. The company is using 2-yd. clamshell buckets of the Williams make on its diggers.

Its big steam all-steel towboat, the C. F. Richardson, placed in service about a year ago and costing approximately \$350,000, is a floating testimonial of what the West Kentucky company thinks of the future of river transportation.

The problem of loading coal into barges is simple for those mines near the headwaters whose tipples are directly on the river bank. Many properties that are back from the river distances up to half a mile use conveyors. In the case of one of the Frick mines near Connellsville, Pa., a conveyor five miles long is now under construction. But in the case of many mines in West Virginia and in the Kentucky fields, short rail hauls in company equipment connect mine tipples with river-loading tipples, where coal is chuted from drop-bottom cars through a pocket under the track directly to barges in the river below. At some loading points the loading is by crane.

Unloading at points of destination usually is accomplished with "digger boats" or steam cranes mounted on boats and operating 1½-yd. or 2-yd. clamshell buckets. Where great volumes of coal are handled regularly, usually the unloading is by clamshell into hoppers which load 1-ton cable cars on an incline running up to a coal-storage plant. Where the coal is being reloaded for rail haul and where the river bank is low, usually the unloading is direct from barge into railroad car by "digger."

If the river bank is high, the standard-gage railroad track paralleling the river may be built on an incline of 1½ or 2 per cent running down into the water. Thus it can be used at any river stage. Some unfortunate experiences with tracks floating off such inclines during high water have led to the use of steel ties and track-anchoring schemes.

The cost of unloading by "digger" boats varies. Some small riverside coal companies that do not own their own "digger" boats get service from the water coal companies when they purchase river coal. The average charge for such unloading service is 50c.

a ton because it is sometimes necessary to move the "digger" boat several miles to the unloading point. However, the Pittsburgh Fuel Co., Louisville, estimates that under normal conditions the cost is only 5c. or 6c. a ton for digging coal and handling it into the elevator or to yard piles.

In unloading the old wooden barges it was found that seven-eighths of the coal could be taken from a barge in about the same time as the final eighth, as cleaning up the barge bottom is slow hand work. The clamshell can't clean up barge bottoms on the old-style single-skin wooden barge. The new steel barges, however, have inside wooden "skins" with sloping sides which deliver the coal toward the center, making clamshell unloading more nearly complete. Also the new barges have fewer cross members to interfere with the bucket's operation.

THIS STRONG-BACK-AND-WEAK-MIND JOB IS PASSING

These huskies are coaling a river steamer from a barge, which is a method once used to unload barges at destinations in the days before mechanical unloading machinery came into general use.

Whereas once upon a time river coal was handled on and off of barges by long lines of singing, shuffling negroes with two-bushel baskets and two-man boxes, today steam and electricity do the job with a great deal more speed and a great deal less perspiration. Every year sees more economy and more mechanism. This is expected to be especially noticeable during the present summer and next autumn, as the river coal fleets grow in number and in unit capacity.

That work will progress more rapidly on the Ohio River to completion of the 9-ft. stage is shown in reports that \$5,000,000 has been appropriated for Ohio River lock and dam work, and \$375,000 for channel work, of the \$56,000,000 appropriation of Congress for river and harbor work, which action was taken over the protest of the Budget Bureau. The money for Ohio River work has already been allotted by Secretary Weeks. Large sums also have been allotted for work on the Monongahela, Tennessee and Cumberland rivers, all tributaries of the Ohio.

Upper Ohio River districts report some shipments of coal and oil, while movement into Louisville from the Kentucky River and Kanawha River continues good. Some of the local retailers who have not handled river coal for the past several seasons will stock it this year.

A Coal Gas Mainly Consisting of Hydrogen

A NEW method of making coal gas has been investigated by C. B. Tully, an engineer of Newark-on-Trent, Nottinghamshire, according to report received by the Department of Commerce from Vice Consul Herbert C. Biar at Nottingham. After three years of experimentation he has succeeded in considerably reducing the quantity of carbon monoxide in household gas from the 12 per cent which it usually contains. The experimental work is said to have definitely passed the research stage.

The inventor claims that not only is this invention valuable from the standpoint of health and safety but also for other reasons, such as the possibility of making a gas containing from 87 to 90 per cent of hydrogen for use in the manufacture of synthetic ammonia or for filling the gas bags of balloons and dirigibles.

The importance of the invention is said to be definitely proved by its adoption by new plants in various parts of the United Kingdom, and the London representative of a Japanese firm is reported to have arranged for an installation at Kobe, Japan.

TRACK LAYOUT ON
A ELEVATOR
INCLINE

Some inclines are double tracked clear down to the water's edge, where a double loading hopper is used. In this case the hopper is single and the pair of balanced cars both load at the same point.

New Equipment

Permissible Headlight for Gaseous Mines

IN THE further development of permissible equipment the Mancha Storage Battery Locomotive Co. of St. Louis has recently placed upon the market a headlight suitable for use on storage-battery locomotives or any other type of machine, such as a coal cutter, used in gaseous mines.

The headlight is very simple in construction, being made of a few parts. It is nearly a round barrel threaded at each end to receive a cap after the insertion of the spider which carries the light socket, which

EXPLODED AND ASSEMBLED VIEW OF FLAME-PROOF PERMISSIBLE HEADLIGHT

Simplicity of construction, few parts and ruggedness are big features of this headlight. It is built to withstand the hard usage frequently experienced on haulage and coal-cutting equipment.

in turn is equipped with a railroad-type concentrated filament standard base lamp and reflector. Provision is made for locking the entire outfit in order to guard against tampering in the mine.

This headlight has received the approval of the U. S. Bureau of Mines at Pittsburgh, Pa., for use as flame-proof permissible equipment, having successfully met all requirements and withstood the necessary tests.

Helical Reduction Gear Unit

VARIOUS means have been adopted for reducing speeds of motors to drive slow-moving machinery and equipment around the mine, but a helical reduction gear unit, made by the R. D. Nuttall Co. of Pittsburgh, Pa., embodies the advantages of the helical gear.

The unit is made up of a gear and pinion meshed together and held in position by heavy bearings. The complete unit includes a casing which makes the gearing safe, free from dirt or falling bodies and provides a space for returning the lubricant. When the cover is over the gears, aside from giving complete protection it prevents spillage of the lubricant and permits a clean installation to be made in any place.

The slight angle of the teeth on the gear and pinion

SPEED-REDUCING UNIT

Helical gears result in smooth running. This unit economizes space and makes possible a safe installation that needs little attention or maintenance.

provides a condition which results in quiet running and no impact, insuring long life and even wear.

Its main field of application probably will be for screen, shaker, jig and fan drives. In these cases its application will permit the installation of the motor near the driven machine and result in economy of space and greater safety.

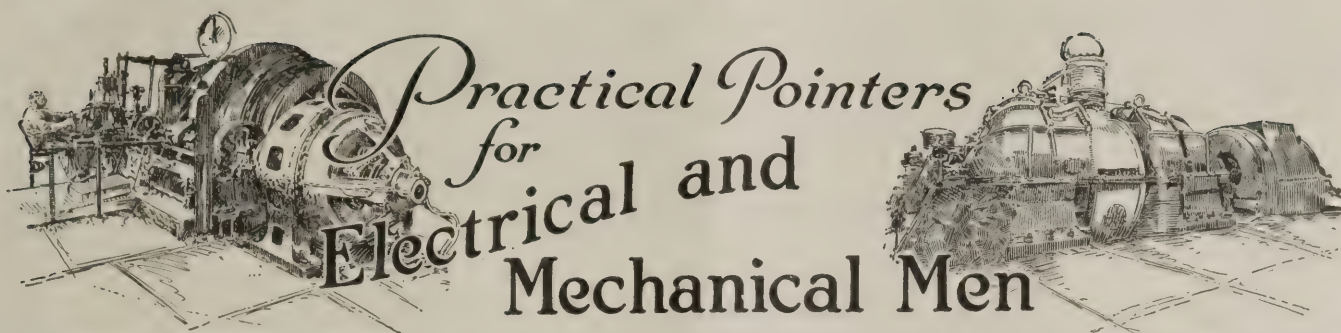

Flexible Drive Shafting

THE increased use of small electric motor-driven appliances has created a demand for flexible drive shafts and tubes. To meet this demand, the Stow Mfg. Co., of Binghamton, N. Y., have completed a line of sizes of flexible shafting which they are applying to a large variety of drives. Portable drills, tapping, reaming, wood-boring, grinding, and buffing machines, probably will be used more extensively around coal mines and in machine shops in the future, as the economy of carrying the tool to the job instead of the job to the machine is realized. The advantage of having the driver remote from the tool in confined places favors the use of flexible shafting, and it is in such applications that the shafting will have its greatest use.

OPERATING A PORTABLE GRINDER

The flexible shaft permits the application of electrical energy to repair processes that heretofore have been almost invariably done by hand.

Important Considerations in Making Insulation Tests

ELECTRICAL equipment employed at a coal mine is called upon to operate under conditions that make it essential to maintain close supervision not only in order to detect or avert mechanical damage but also deterioration of the insulation. The atmospheric conditions often vary between one portion of the mine and another. In the intake airways the temperature is normal and the moisture content of the air is unlikely to cause insulation damage as quickly as in the return airways, where moisture in the air often is excessive.

Regardless of the situation in which apparatus may have to work, however, it is essential, in order to avoid unexpected breakdowns, to make insulation tests regularly and record the results so that any falling off in resistance may be detected and the proper steps taken to prevent a breakdown.

For ascertaining insulation resistance the equipment usually employed consists of a magneto and an ohmmeter. These devices may or may not be combined in a single unit for the sake of portability. In any case the apparatus has two terminals, one of which is sometimes marked "line" and the other "earth." The terminal marked "line" should be connected during a trial to the winding of the apparatus to be tested, but the terminal marked "earth" should not be joined merely to some object that is grounded, for this procedure may lead to unreliable results and give a false indication. Provided each piece of apparatus has a ground wire attached to its frame it makes no difference whether the "earth" terminal of the testing set is connected to the frame or some other grounded object some yards away. There is always a possibility, however, of a ground connection being broken. The results of an insulation test in such a case might be misleading unless the earth terminal is connected direct to the frame of the apparatus being tested.

Thus equipment that is mounted on a dry concrete foundation may be completely insulated from the earth. The same applies to equipment set on a wood foundation, assuming in both instances that no ground exists. Obviously, in either of these cases, if, when making an insulation test, the "line" wire from the testing set is connected to the apparatus while the "earth" terminal is fastened to some grounded metal work remote from the frame of the machine itself, a break exists in the circuit a comparatively high insulation resistance will be indicated even though the insulation of the apparatus may be actually low, permitting leakage to the frame.

In view of such a possibility the safest way to test all apparatus underground where illumination is poor and broken ground connections may escape detection is to make insulation tests by habitually connecting one

wire to the machine windings and the other to the framework of the apparatus itself. Similar precautions should be taken in all kinds of testing. Unnecessary emphasis may seem to be laid on this detail, but experience has shown that an intelligent use of a testing set is not always the rule.

Effect of Low Lagging Power-Factor

WILL you kindly give in your columns a discussion on the subject of low lagging power-factor and how it affects the operation of transformers and generators. I am interested to have shown how it affects regulation and efficiency, also how it affects the load which the equipment can carry.

ELECTRICIAN.

Transformers are rated in kva. output; a 100-kva. transformer is supposed to deliver 100 kw. at unity power-factor at normal voltage and at normal temperatures; but if the power-factor should be lagging 60 per cent, the energy output of the transformer would be only 60 kw. and yet the current, and consequently the heating, would be approximately the same as when delivering 100 kw. at unity power-factor.

The regulation of transformers is inherently good, being for small lighting transformers about 1½ to 3 per cent for a load of unity power-factor and about 3 to 5 per cent at 70 per cent power-factor. Large transformers with a regulation of 1½ per cent at unity power-factor load would have about 6 to 8 per cent voltage regulation at 70 per cent power-factor.

Alternating-current generators also are rated in kva., usually at any value of power-factor between unity and 80 per cent. The deleterious effects of low-power-factor loads on alternating-current generators are even more marked than on transformers. They are decreased kw. capacity, decreased efficiency, impaired voltage regulation as well as the necessity for increased exciter capacity.

Assume the case of a generator designed for 80-per cent power-factor supplying a circuit whose power-factor is 60 per cent. It is probable that normal voltage at the rated ampere output could be obtained only with difficulty, even though at this power-factor the generator would only be delivering 75 per cent of its rated kilowatt load. The field losses and, therefore, the field heating of the alternator, when delivering rated voltage and current are greater at lagging power-factor than at unity. Increased losses and decreased energy output both cause a reduction in efficiency. The regulation of modern alternating-current generators usually is about 15 per cent at unity and about 30 per cent at 80 per cent power-factor lagging. The operation of transmission lines and cables at a low power-factor also results in lower kilowatt carrying capacity, lower efficiency and increased voltage drop.

Hence, low lagging power-factor on a system generally will mean greatly reduced capacity of generators, and, therefore, limited output of prime movers, greatly reduced capacity of transformers and lines, as well as increased energy loss and poor voltage regulation.

Importance of Demand Charge on Power Bill

NEARLY all power contracts made up and used by the electric power companies have a clause which deals with the subject of maximum demand. From various electric-supply catalogs which I have I find that there are such things as 5-, 10-, 15- and 30-minute maximum demands, yet there is not sufficient information in the catalogs to give a clear idea of just what is meant by maximum demand.

For years our company has been buying power on a contract which has in it a clause on maximum demand, yet I have been unable to find anyone around the colliery who can explain what it means and how it is obtained. The bills are paid each month and it is a sure thing that the maximum demand greatly influences the amount of the power bill. I have noticed at times that the actual power consumption is sometimes lower than at other times, and yet the power bill is higher. I am told that this is due to some effect produced by the maximum demand.

The situation is that here is an important factor in the power bill which costs real money in its effect on the power bill and yet it is not understood, and, consequently, not being understood, nothing can be done to keep the power bill down.

This is so strange a situation that I believe an explanation in your columns would be most interesting. At present it appears as if we are paying for something we are not getting and this is a means for holding the power bill at a high charge when the power consumption is low and therefore the bill ought to be low.

ELECTRICIAN.

Maximum demand, in electrical language, means the greatest average use of power during a certain agreed interval of time, 15 minutes being the period usually chosen. For example, the figure shows a curve indicating the irregular use of power during a one-hour period of operation of a coal mine. For the first 15-minute period the demand meter shows a maximum demand of 810 kw. Note that the maximum instantaneous peak is about 950 and the lowest point is 720 kw. What the demand meter does is to average all the instantaneous loads during the 15-minute period, or in other words integrates the load during that period.

Another way of visualizing what the maximum demand meter does is that it balances the oppositely cross-hatched areas and registers the location or value of the line which balances these two areas. The maximum 15-minute demand during the one-hour period shown in the figure obviously is during the third 15-minute period and its amount is 970 kw.

When the demand is on a 5-, 10-, 15- or 30-minute basis this means that the meter establishes an average over every 5-, 10-, 15- or 30-minute period during the whole period that the meter is installed.

Obviously, if a load is constant the maximum demand would be the same whether measured on a 5- or 30-minute basis, but when the load is irregular, the shorter the time interval the greater will be the maximum demand because there will be less opportunity for low

SECTION OF LOAD CURVE SHOWING
15-MINUTE DEMANDS

Maximum demand is the average 15-minute maximum load established during the metering period, it being an average of all the instantaneous demands during any 15-minute period.

instantaneous points to average down the high peaks which occur. When the time interval over which the maximum demand is obtained is long, there are more low points on the irregular load curve to help average down the high load points. This being the case, it is more desirable for a purchaser of electric power to have his demand established over a 15-minute period than over a 10-minute period.

For the power company to supply its customers it must have a certain generator capacity in its power house, and one purpose of the demand meter is to determine how much generating capacity is needed for each customer; and each customer is then charged an amount which in part is proportional to the generating capacity installed in the power house for his particular load.

A high maximum demand when once established usually is held by the power company as being the maximum demand for billing for several months due to the fact that if once established by the consumer it is necessary for the power company to be ready at all times for this load and necessarily it must keep in reserve the capacity required for carrying this load again.

Usually the power bill is made up of two separate charges, one being the demand charge and the other the energy charge. If the demand is relatively low the demand charge is low regardless of the energy consumption and energy charge. If the demand is high the demand charge will be high. For this reason it may occur that a high demand may be established during a certain month when the energy consumption is low and the preponderance of the demand charge will make the power bill higher than in another month when demand is relatively low and energy consumption high.

In most power schedules the charge per kilowatt of demand is at least about \$1.50. From this it is apparent that a continuous load of 100 kw. such as a pump will cost the consumer a demand charge of \$150 a month to run if it is run at a period when the other power-consuming apparatus is establishing its maximum. An important consideration at this point is that the cost to run this pump will be at least \$150 if the pump is run for as short an interval as only the 15-minute maximum demand period. The proper thing to do is to operate such equipment during the night if possible or at some time when the load on the other equipment is low.

For abnormal peak loads established during some accident, such as a ground on the system, most power companies make due allowance which the consumer should take advantage of by properly identifying the period during which this accidental demand was established.

Problems of Operating Men

James T. Beard

Working Two Steeply Pitching Seams of Coal

General Outline of Conditions—Seams Reached by Double-Track Tunnel—Gangway Levels and Counters with Headings Driven to Rise

REFERRING to the inquiry of L. L. Travis, *Coal Age*, June 7, p. 942, allow me to suggest a plan that will apply to the working of steeply pitching seams such as he has described, assuming that both seams are gaseous, under the conditions prevailing in the locality from which he writes (Utah).

The five- and six-foot seams of coal mentioned are said to have an inclination of 45 deg. and to be separated by 125 ft. of solid strata, the hangingwall and footwall being each massive sandstone 20 ft. in thickness. As stated by the editor, it would have been helpful to know the exact physical conditions affecting the situation; but I will assume the proposition corresponds to the profile he has shown on page 942.

In addition to what has been said in the reply to this inquiry, allow me to suggest that this property should be opened and developed by two crosscut tunnels, one 7 ft. high and 16 ft. wide, to be used as the main haulage road and equipped with two tracks having an ample clearance on each side and between them.

PROVIDING FOR LARGE FUTURE TONNAGES

The road should have a grade of 8 in. per 100 ft., in favor of the loaded cars, and be well drained by a good ditch. This will make ample provision for an output of from 3,000 to 5,000 tons of coal per day when both seams have been fully developed.

The other tunnel, which will be used as a gangway and intake air-course for the ventilation of the mine should be driven 8 ft. 4 in. high, in the clear, and 12 ft. wide, giving a sectional area of 100 sq.ft. This opening also should be ditched on one side for drainage. In my opinion, it would not be good mining practice to open this property with a single tunnel, with an airway or manway bratticed off on one side, which would be hard to make air-tight.

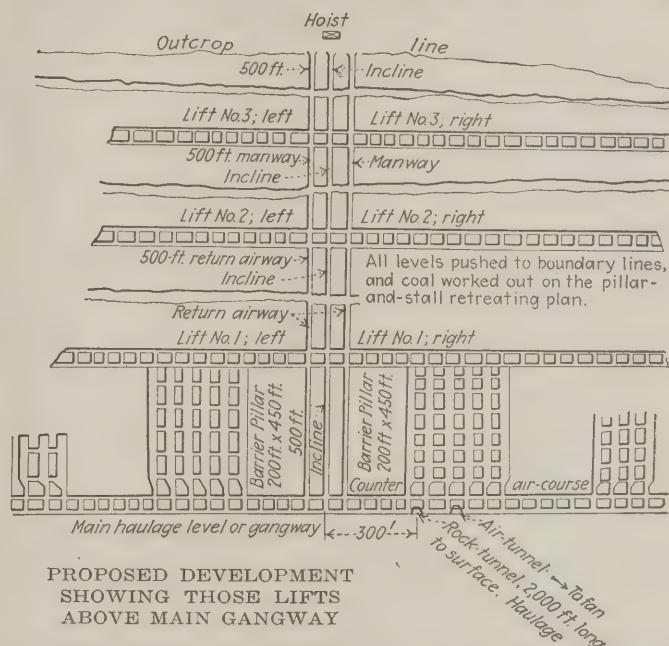

Assuming, as stated, the cross-tunnel is driven at a 2,000-ft. level, it would be necessary to drive two tunnels as I have suggested, in order to comply with the state mining law in respect to providing a second opening. The state law of Utah (Sec. 1513) forbids the employment of any person or persons as workmen in a mine, unless there are provided two distinct openings for each seam of coal worked. These openings must be separated by not less than 150 ft. of solid strata, at the surface, and not less than 30 ft., at any point where they are available in the mine.

An experience of 30 years in the working of pitching seams has taught me that where these are properly developed, they are capable of very large production.

In the present case, when the cross-tunnel has reached the lower seam, gangways or levels should be turned to the right and left in that seam and counter levels driven 50 ft. above, as measured on the pitch of the seam.

The main entry should be 7x12 ft., in section, and the counter levels or air-courses 7x10 ft., in section. Owing to the massive sandstone hangingwall, these entries will require very little timber. It should only be necessary to set posts, about 5 ft. apart, along the high side of the entry where the coal has to be lagged to keep it from falling on the track or floor of the opening.

In order to provide some immediate return on the large sum of money expended in the development thus far, in driving 2,000 ft. of double rock tunnel, the

lower lift of 500 ft. should be opened up in the under seam at once, by driving rooms 25 ft. wide, with 40-ft. pillars between them, and connected with crosscuts every 60 ft., measured on the full pitch of the seam, as I have indicated in the accompanying figure.

Again, while this necessary work is going on to supply needed coal, three raises should be started at a point 300 ft. from where the rock tunnel struck the coal. This distance will provide ample room for the side tracks required to handle the coal that will come from the upper lifts, later, when these are developed. The center one of these three raises should be driven 15 ft. wide and used as an incline to drop the coal from the different levels to the gangway below. These levels are located 500 ft. apart, measured on the pitch of the seam.

The two side raises flanking this incline should be 15 ft. wide and used as air-courses for their respective sides of the mine. A manway should be provided in

each by running a brattice 3 ft. from the rib and building a stairway for safe and easy climbing to reach the different levels.

It should be stated, here, that these upper levels are not to be started, until the incline and air-courses have reached the surface, where an electric hoist must be established at the mouth of the incline. This hoist should be capable of dropping five-car trips from any level to the gangway below, the cars being each of three tons capacity.

As soon as this is done, work on the several levels or lifts can be started and these entries should then be pushed forward to the boundary lines. A sufficient number of rooms should be opened on each lift to give the desired tonnage of coal. The rooms on the several lifts can be driven up in pairs with large panel pillars between them, say two rooms to every panel of 300 ft.

RETREATING SYSTEM MOST PRACTICABLE

My plan would be to start from the boundary and work out the coal on the pillar-and-stall, retreating system. I believe this would prove the most economical and practical method of working these two seams. Care should be observed to keep the workings in the upper levels in advance of those in the levels below, and to maintain the proper angle of the breaking line, as experience will determine.

The extraction of the coal in the overlying seam should be accomplished by driving crosscut tunnels from each level to the seam above, which will enable the coal to be brought out on the level in the seam below and dropped down the incline provided in that seam.

In closing, allow me to suggest that if this property is very extensive a series of inclines should be provided at points determined as being most convenient and practical for the extraction of the coal in both seams.

Glen White, W. Va. J. W. POWELL,
Shaft Contractor.

Entry of Air to Safety Lamps

Continual diffusion of gas prevents clear line of division between gas and air—Experiment to test a safety lamp with a carbide lamp to show entry of gas does not take place through the chimney.

SINCE the inquiry regarding the entry of air into a safety lamp was published in *Coal Age*, Feb. 8, p. 260, a number of letters have appeared in reference to the matter. In one of these, in particular, the attempt is made to show that much of the air entering a safety lamp passes through the mesh of the gauze just above the glass cylinder.

The writer of one letter (May 10, p. 761) in explaining that the purpose of providing entry for the air below the flame was to lessen the tendency of the lamp to smoke by reducing the conflict between the ascending and descending currents, strongly urged that there is always "a primary ascending current and a secondary descending current" within the combustion chamber of every safety lamp of the general type of the Wolf and the Koehler lamps.

Several years of practical experience with different makes of lamps, particularly the Koehler, in both the anthracite and bituminous fields, has convinced me that the entrance of air to the combustion chamber of either the Wolf or the Koehler lamp is practically confined to

the ports of entry below the flame and that no appreciable amount of air enters these lamps through the mesh of the gauze chimney.

In raising this question as to the entry of air into a safety lamp, the inquirer mentions a test made with a Burrell gas detector when the end of the rubber tube attached to that device was held on a level with the top of the safety lamp chimney, close to the roof in the mine. In this position the detector showed 1.7 per cent of gas and a faint cap was observed in the lamp. Then, on lowering both the lamp and the detector about ten inches, no trace of gas was found.

RAPID DIFFUSION PREVENTS CLEAR DIVIDING LINE

To my mind, this result was plainly due to the diffusion of the gas collected at the roof. Personally, I do not believe there is ever formed a distinct line of division between an accumulated body or layer of gas and the air, owing to the continual diffusion that is taking place between the two, as has often been explained in the columns of *Coal Age*. Any movement of a person walking in an entry or raising a lamp towards the roof very naturally disturbs the gas and causes it to mix more rapidly with the air.

On many occasions I have gone into places where, on lifting my lamp towards the roof no indication of gas could be observed until I blew gently against the roof and was then able to detect a faint cap on the flame of the lamp. These instances show that a thin layer of gas at the roof will not enter the top of the lamp; but blowing against the roof brought the gas down to where it entered with the air at the ports of entry below the flame.

Some may ask, "If diffusion was continually taking place between the gas and the air why was it necessary to blow the gas from the roof, in this case?" My answer is that the layer of gas at the roof was very thin and the zone of diffusion did not extend low enough to enter the ports of entry below the flame. It is my belief that the discharge of the heated air and products of combustion through the gauze chimney of a lamp prevents the entry of air or gas at that point, under all ordinary conditions.

TESTING A SAFETY LAMP WITH A CARBIDE LAMP

After reading the several letters setting forth the views of writers on this subject, I decided to make the experiment of testing my safety lamp with the acetylene gas generated in a carbide lamp, after the manner that some readers will recall was described in a previous issue of *Coal Age* (Vol. 22, p. 760), under the title "Testing a Safety Lamp with a Carbide Lamp."

For that purpose, having assembled and lighted my safety lamp, I charged the carbide lamp with fresh carbide and turned on the water but did not light that lamp. Holding the carbide lamp in a position near the top of the safety and allowing the gas generated by the action of the water on the carbide to play about the chimney of the safety lamp, there were no apparent results, as the flame gave no indication of the presence of the gas.

However, on lowering the carbide lamp to a point near the level of the ports of entry below the flame there at once followed a series of miniature explosions within the combustion chamber. I concluded that if the gas-charged air, which surrounded the chimney in the first case, could have entered through the mesh of the gauze the same small explosions would have been

produced within the lamp, as in the second case. Let me say that this is offered in no spirit of criticism but in the hope of shedding further light on a most important subject.

REESE THOMAS.

Royalton, Ill.

Inquiries Of General Interest

Machine Mining When Working Steep Pitches

Difficulty in Keeping Machine Up to Its Work—Suggests Use of Cable and Winch Located Above Panel and Operated by Control Switch on Machine

READING the inquiry of L. L. Travis that appeared in *Coal Age*, June 7, p. 942, regarding the working of two seams having an inclination of 45 deg. reminds me of a proposition of another kind with which we are confronted in the working of a seam of coal on an equally steep pitch.

In regard to the best method of working out the coal on such steep inclinations, allow me to suggest that our experience has proved quite conclusively that the longwall retreating panel system is the most satisfactory method to adopt, provided the conditions are such as to admit of applying that system successfully. Our proposition differs from that described by Mr. Travis only in the fact that our mine is opened on a slope, which avoids the necessity of driving the long rock tunnel he mentioned.

In my opinion, the adoption of a system of mining that is capable of recovering the largest possible percentage of lump sizes is of paramount importance. After carefully considering the adaptation of different methods of mining the coal and being forced to admit the limitations of the punching machine, our choice fell on the chain machine as being the best means of cutting the coal.

However, the use of a chain coal cutter, on a 45-deg. pitch, presents one almost insurmountable difficulty and that is, keeping the machine up to its work. After trying different means of overcoming this trouble, a scheme has suggested itself to my mind that I would like to present for the consideration of *Coal Age* readers, many of whom have doubtless become expert coal cutters, under varying conditions.

My idea is to develop a chain machine containing, within itself, only the mechanism for driving the cutter chain. This machine would be attached to and supported by a cable dropped down the incline, from a winch located on the level above the panel being worked. The operation of the winch is to be controlled by a switch on the coal-cutting machine, within ready reach of the operator or machine runner.

It is needless to say that this winch must be a very slow-speed affair, designed to meet the conditions required where a slow winding drum is electrically operated. In this plan, it is clear that the coal forming a panel would be taken out in consecutive skips reaching from the bottom to the top of the panel. The machine

can be held into the face of the coal by the post and chute boards usually built on such a pitch, for conducting the coal to the mine cars in the level below the panel.

Allow me to ask of *Coal Age* and its readers if this scheme appeals to them as having any value that would recommend its trial and adoption where conditions will permit. As far as my knowledge goes, the greatest difficulty, in the application of longwall chain machines to the cutting of coal on heavy pitches, is the inability of the machine to feed forward without containing within itself such a heavy driving mechanism as to make it cumbersome and difficult to handle.

Seattle, Wash.

WILLIAM STRAIN.

It is not clear what plan this correspondent has in mind, regarding pillar support on the upper side of the panel. In working out the coal on a longwall retreating panel system, where a mine has been opened by a slope driven on the full dip of the seam, it is assumed that the extraction proceeds, lift by lift, in regular order, from the surface downward, leaving sufficient pillar protection at the outcrop to prevent surface drainage from entering the mine.

In this plan, it is natural to assume that the gangway levels are driven to the right and left of the slope and extended to the boundary lines, where the panel is cut across between two consecutive lifts and a longwall face opened extending from bottom to top of panel, on the full pitch of the seam.

Assuming the conditions in the roof and floor of the coal are favorable, it would seem that the correspondent's plan has merits that would recommend its trial in any particular place. *Coal Age* will be glad to receive comments giving the opinion of its practical readers who have had experience in the operation of coal produced on steep pitches.

Can Blackdamp Become Explosive

Reduction of carbon dioxide to carbon monoxide makes mixture explosive—Coal dust suspended in air and rendered incandescent by flame the active agent.

THERE has been some discussion here, recently, regarding the question of whether a body of blackdamp can be transformed into an explosive mixture, under any conditions that can possibly exist in the mine. The contention of a few that this is possible has led us to submit the question to *Coal Age*, hoping for information that will settle the dispute.

STUDENT.

Houston, Pa.

It is true that, under the conditions existing in a mine at the moment of an explosion in which coal dust has played an important part, the carbon dioxide (CO₂) formed by the explosion may be reduced to carbon monoxide (CO), owing to the presence of large quantities of incandescent particles of carbon (coal dust) floating in the air. However, this fact can hardly be taken as answering the question, whether blackdamp can be rendered explosive under conditions that may exist in the mine.

As is well known, blackdamp is a mixture of carbon dioxide and air. Such a mixture is deficient in oxygen by reason of the presence of the gas. Assuming that the blackdamp in question has been produced by other causes and is not the immediate result of an explosion,

it can be stated that the mixture cannot be rendered explosive under any conditions that may commonly exist in the atmosphere of a mine. The condition, in such a case, is quite different from that resulting in the production of carbon dioxide in the presence of quantities of coal dust floating in the air and rendered incandescent by the flame of the explosion.

In this latter case the mixture formed by the explosion can hardly be described as blackdamp, although having much the same composition except for the presence of the incandescent carbon particles, which are the active agent in the reduction of the carbon dioxide to carbon monoxide and the formation of an explosive condition on the addition of fresh air. Therefore, in answer to the question asked, we would say that, in the general understanding of the term "blackdamp," such a mixture cannot be rendered explosive under conditions that commonly exist in a mine.

Examination Questions Answered

Miscellaneous Questions

(Answered by Request)

QUESTION—*An entry has 17 working rooms. Rooms 11 and 12 are full of gas. Men are working in Rooms 13 to 17, inclusive, also in the entry and air-course. State how you would remove this gas, the air being conducted on the split system.*

ANSWER—Before making any attempt to disturb the gas accumulated in Rooms 11 and 12, notify the men working in by of these rooms to extinguish their lights and withdraw promptly and as quietly as possible. At the same time, notify all the men working on those entries to withdraw from the mine. This being done and having selected reliable and experienced men to assist him, the fireboss should station a man at the mouth of the entries with instructions to permit no one to enter.

Then, having increased the circulation as far as this can be done with safety to other sections of the mine, proceed to turn practically all of the air into Room 11, by building a brattice or hanging a canvas just in by from the mouth of that room. Use none but approved safety lamps that have been carefully examined before starting the work. If necessary, extend brattice up the mouth of the room or start it from the outside rib of the last open crosscut between that room and No. 12. The brattice should be extended gradually toward the face, keeping a careful watch of the lamps and making frequent tests to determine the progress of the work.

When all the gas has been driven from the face of Room 11, the same work must be performed in Room 12, by extending the brattice gradually, from the outside rib of the same crosscut to near the face of Room 12. It may be a good plan to hang a canvas in the last open break through between Rooms 12 and 13, in order to prevent the gas from passing out through the last four rooms on these entries. If convenient to do so, a crosscut on the entries may be opened to allow the gas to pass at once into the return air-course.

Finally, the work must be continued from room to

room and at the face of the two entries, until all the places have been swept clear of gas. Every place on these two entries must be carefully examined and found to be safe for work before men are again permitted to enter.

QUESTION—*What do you assign as the cause of the greatest number of explosions of firedamp?*

ANSWER—Probably the greatest number of gas explosions have been caused by the careless use of open lights in places supposed to be free from gas or generating but a small amount not considered dangerous. Another frequent cause of explosions of gas is the use of defective safety lamps. A third but less frequent cause is due to the presence of matches and smoking material carried into the mine in violation of the rules and regulations of the place.

QUESTION—*How would you conduct your examination of a gaseous mine to ascertain its true condition?*

ANSWER—Equipped with an approved type of safety lamp that has been carefully examined, assembled, lighted and tested, the examiner should enter the mine or section to be examined and follow the intake air throughout its course, having first noted that the usual quantity of air is in circulation and passing into the section. Each entry, passageway and working face should be examined for all possible dangers that may exist. A careful test for gas must be made at or near the working face of each place examined and the roof and coal closely inspected and its condition noted. Where bad top is found this should be marked to be taken down or made secure by timbers. The quantity of timber, posts and tracks should be noted in each working place.

QUESTION—*Describe the different systems of ventilation in use.*

ANSWER—Aside from natural and furnace ventilation employed under conditions favorable to their use, the two general systems of ventilation are known as the blowing and the exhaust systems, respectively. In the blowing system, the mine is ventilated under a pressure greater than that of the atmosphere. By means of a fan air is forced into the mine against the frictional resistance of the airways, which must be overcome by the pressure due to the action of the fan.

In the exhaust system of ventilation, the mine is ventilated under a pressure below that of the atmosphere. In this case, the action of the fan creates a depression in the fan drift; and the atmospheric pressure, acting on the other opening, forces the air into the mine against the frictional resistance of the airways. The ventilating pressure is then the difference between the atmospheric pressure and the vacuum or depression created by the fan.

QUESTION—*If certain working places in a mine generated gas frequently and other working places gave off little gas, which would you examine first in making your rounds in the morning and for what reason?*

ANSWER—In the absence of other reasons that would change the order of the examination, a fireboss should first examine the places generating little gas, leaving those generating gas in larger quantities until the last. The reason for this is that there is more danger of gas accumulating in places generating gas freely, between the time of making the examination and the entrance of the men for work. If these places are left and examined last their condition when the men enter for work will correspond more closely to that found by the fireboss in his examination.

Mine Inspectors Talk Safety from Many Angles In Convention at Pittsburg, Kansas

Firing mine shots by radio, making mine electrical machinery and equipment really safe, using water effectively to reduce "bug dust" in machine cutting, training men to be real miners instead of dangerous novices—such subjects as these were discussed by the Mine Inspectors' Institute of America at its Pittsburg (Kan.) convention, July 10-12, in such a way as to be helpful to coal mining. The essentials of the convention were reported in last week's *Coal Age*, but much of the discussion was left for this issue.

Inspector James Dalrymple, of Colorado, took the lid off. He had tried since last summer's convention to sound out Colorado opinion on what should be done to lessen the hazards of running electrical machines, but got only eleven answers from sixty letters. Eight were for limiting the use of such machines only in most gaseous mines, and against any other limitation. Eight also were for putting machines under strict requirements to make them permissible before they could be sold.

Mr. Dalrymple's own opinion is that insulation is the most important factor in electrical safety. He believes 95 per cent of insulation is bad. In wet places he thinks cable, for instance, would be safer if it were bare because moisture damages practically all insulation; he believes the miner puts too much confidence in it. That is the reason in the last nine years in Colorado seventeen men have been electrocuted by trolley wires and twenty-four by new insulated wires.

"We should have all electrical machines the safest that it is possible to build," said he, "and passed upon by the Bureau of Mines, not merely by the manufacturer, who is financially interested."

WOULD EQUIP FANS WITH AUXILIARY POWER

He held that ventilating fans should all be equipped with auxiliary power. In Colorado power goes off so frequently that a fan without auxiliary power is dangerous. Gasoline-engine auxiliaries are going to be advocated for Colorado by a joint conference of insurance-company inspectors and state inspectors. In nine years ten Colorado miners have died because of fan failure and something must be done about it.

President Lambie, in the discussion, suggested that to make machines in mines conform to permissible regulations every machine should be examined by a Bureau of Mines man after delivery at the mine where it is to be used. Dr. J. J. Rutledge, chief of the Maryland Bureau of Mines and long in the government service, said that at present the U. S. Bureau checks up on permissible explosives manufacturers by surprise tests and that possibly the electrical section does the same thing on electrical machines that bear the Bureau's approval of design, but that a real source of trouble lies in the fact that manufacturers nowadays adopt their own "permissible" standards and so label their output. This often confuses the buyer and the miner.

"There should be government standards for everything electrical," contributed Chief Inspector James Sherwood of Kansas, "and they should be rigidly enforced." He thinks the practice of snipping cable connections onto trolley lines should be prohibited along with all other uninsulated connections. His opinion is that danger from electricity increased when direct current began to give way to alternating current. Line surges too short to damage machines have killed men on circuits with voltages as low as 110. Dr. Rutledge suggested that storage-battery cutting machines are practical and should be safe enough for anybody.

"But when all is said and done," offered Martin Bolt, assistant director of the Illinois Department of Mines and Minerals, "what are we inspectors to decide when electrical engineers can't agree on what should be done?" Inspector V. E. Sullivan, of West Virginia, said inspectors at least could do their best by publicity to advertise the dangers of electricity and keep miners on the watch.

Before the end of the convention the institute, although disapproving Mr. Dalrymple's contention that all electrical machinery and equipment should be made permissible by the Bureau of Mines, resolved that the bureau be requested to make every possible effort to discover means to make such equipment "as safe as possible."

A novel plan of wetting "bug dust" was reported in use by the Tennessee Coal & Iron Co. Frank Hillman of the Woodward Coal & Coke Co. of Alabama said the scheme is to loosen the plates on the cutter bar of a mining machine and lay in the groove therein a $\frac{1}{2}$ -in. pipe. Water playing out the open end of this pipe is right at the cutting point and is carried into the kerf and mixed with the dust much more thoroughly than by merely running water on the top of the cutter bar. The machine dust comes out as mud and is therefore thoroughly wet down and as little dangerous as dust can be.

The institute so thoroughly approved of this plan that it passed a resolution mentioning the scheme and favoring "the application of water wherever practicably possible," especially in cutting. The word "practicably" was inserted after it was considered that in some fields water is scarce and expensive.

Mr. Hillman said washing down not only floor but ribs and roof and the tops of outgoing loads in Woodward mines is regularly practiced. This is considered good protection against both the start and the spread of explosions. In the Dolomite blast, he said, it was significant that the explosion traveled only 400 ft. from the bottom into the mine.

Mr. Sullivan contributed the information that dust explodes because of the gases in it. They invariably travel up an incoming air stream because the oxygen in the new air forms the nucleus for combustion from the initial flame.

Rock-dust "barriers" made famous by the old Ben Coal Corporation in Illinois "are all right, but they can't prevent a blast from starting," according to Inspector Hoey, of a southern Illinois inspection district. "You can't put them close enough to the face," said he. "They must be hung over panel entries. I know of them stopping just one explosion and that was at night when nobody was around. What if the regular thirty-two men had been on duty in that pair of entries just then? They would have died, no doubt. So it is necessary to prevent blasts at the source."

Salt stemming helps in Kansas, Inspector James Sherwood said. Mr. Bolt told of locomotive sand along a haulage way acting as a rock-dust barrier, stopping an explosion in Old Ben No. 11 mine.

WOULD BAR BLACK POWDER AS MENACE

It was almost unanimously agreed that black powder is a menace to any mine and should be barred forever, even though it often permits of getting out a bigger percentage of lump.

Compelling men to be safe is difficult business, but there are some methods worth trying, Secretary J. J. Walsh, of the Pennsylvania Bureau of Mines, said in his letter to the convention. Notwithstanding all the Pennsylvania laws and rules, accidents occur with appalling frequency, largely because men become indifferent to danger by constant association with it. This, he said, is particularly true regarding roof-fall accidents, which cause about 50 per cent of the state's casualties each year.

"What can be done?" he queries. "It is doubtful if additional legislation would prove of much benefit, for the reason that the laws already in force, if strictly obeyed, would insure the safety of the men who are taking down coal. The only thing that can be done to lessen the casualties that occur from this cause is to bring the workmen to a clearer sense of their responsibility. More competent and careful supervision by the mine officials also would be help-

OFFICERS OF MINE INSPECTORS' INSTITUTE OF AMERICA AND SOME OF THOSE IN ATTENDANCE
AT THE CONVENTION IN PITTSBURG, KAN.

Front row, left to right: Dr. J. J. Rutledge, director of the Maryland Bureau of Mines, Institute treasurer; Martin Bolt, Assistant Director, Illinois Department of Mines and Minerals, Institute secretary; Frank Hillman, safety engineer for Woodward Coal & Coke Co., second vice-president of the Institute; R. M.

Lambie, West Virginia chief mine inspector, retired president of the institute; James Sherwood, Kansas chief mine inspector, new president; James Dalrymple, Colorado chief inspector, first vice-president; E. J. Hoey, Illinois district inspector, third vice-president, and J. S. Rogers, assistant secretary.

ful. Both employees and officials grow careless in their work and there is need for discipline that will strictly enforce obedience to the laws and rules governing safety—discipline that metes out severe punishment to the men in charge and to the employees who, by carelessness and recklessness, place in constant jeopardy the lives of the men in the mines.

"A specific suggestion may be made in urging more systematic propping. The foreman and the superintendent should decide on the distance between the props, and the foreman or assistant should insist on strict compliance with the decisions thus made. When this is done the matter of safety then rests with the miner, and no person can do anything more to safeguard life unless it be the fireboss, assistant foreman or foreman who may happen to visit a place at a critical period and be able to give warning of impending danger. As the miner is alone at the face about 90 per cent of the time during the day, he should be taught how to protect his own life.

"It is the aim of our department in its effort to reduce accidents by falls to have more frequent examination of the different chambers in the mines. With the co-operation of the miners and the operators we hope to have the face of each chamber examined by the miner five or six times daily. This would mean more than 750,000 roof examinations every day in the mines of Pennsylvania."

What effect does accident compensation have on accidents? The general feeling of the institute is that there has been no marked decrease. Everybody agreed that reported injuries—especially minor ones—have at least doubled, but that this does not prove actual injuries are any more numerous than they were before. Although compensation should have reduced accidents by bringing about stricter inspection and more rigid enforcement of safety rules through insurance-company pressure, this has by no means worked out.

There have been too many cases of coal companies paying an insurance penalty rather than spend the money to make specified safety improvements, according to Dr. Rutledge. He thinks state compensation commissions should have more power to stop that sort of thing. Mr. Sherwood said the abuse of compensation is general and that the cost to coal companies is shamefully high. Somebody is not enforcing the safety regulations, he declared, or accidents would be reduced 50 per cent.

Saying that compensation should reduce accidents but doesn't, Martin Bolt supplied the information that in Illinois the situation is so bad that old-line insurance companies have raised rates from \$3.50 to about \$6. There not only have reported minor accidents multiplied but reports of major hurts causing time losses of thirty days or more have doubled. Mr. Dalrymple suggested that miners should be made to bear 10 to 20 per cent of the cost instead of the operator bearing it all. That, he thought, would bring miners around to a sounder view of compensation.

The only man who had noted a reduction of accidents since compensation legislation went into effect was Frank Hillman, of non-union Alabama. He said his company, the Woodward Coal & Coke Co., gets real aid in inspection from insurance companies, and accidents in the state have been reduced.

The general sentiment was that unionism defeats much safety effort and that strict discipline by companies over miners would be a remedy.

Chief Inspector Sherwood advocated a codification of the mining laws of the nation in their safety provisions, declaring they should be uniform in all states except as to certain local details. One uniformity he proposed was a national certification of miners. Every man should pass an examination before he is permitted to enter a mine as a full-fledged miner.

"As it is now in Kansas," commented Mr. Sherwood of his own state, "an Italian can come out of New York with a bear and tambourine, leave the bear and tambourine at a mine mouth and go in as a miner. He is a constant danger not only to himself but to everybody else in the mine. All the operator can do about it is pay him and make sure the pay is on time. I believe every miner should be required to learn to read and write English so as to understand safety signs before he gets his miners' certificate. Also he should be required to possess a first-aid certificate. The issuance of such certificates should be in the hands of competent and unbiased persons and each certificate should be revokable at every violation of the safety regulations."

Mr. Bolt was for uniformity of as much as possible of mining laws, but not all features because there is too much variation between states. He favored first-aid certificates but issued only after a man had learned mining and had had underground experience. However, he knew the operators of the country would be against such a certification

plan, contending that it would seriously shorten the labor supply.

The apprentice system was Inspector Dalrymple's suggestion for the proper way to make new miners. No examining board can tell whether a man is careful and of good enough judgment to be fit to be a miner; only an instructor after long acquaintance with him could tell that. He also saw operator opposition to any extension of the mine-examining-board plan because through state boards the union can bar all non-union candidates. There was much favor among the inspectors for the apprentice plan, but J. S. Rogers feared it would merely permit a man to qualify a son or relative prematurely in order to increase the family income; but that the plan would be good if the instructor was allowed merely to say when a man was ready to take a state examination.

The service of the U. S. Bureau of Mines to the mine inspector and to the industry as a whole was discussed by Dr. Rutledge, who has been connected with the bureau fourteen years. He spoke of the valuable work the explosives section of the bureau had done to prove the constant danger of mine dust and to test and grant permits for permissible explosives. He prophesied that some day, through the bureau's research, the country will be firing shots safely by radio and will be using a granulated permissible producing as high a percentage of lump as does black powder.

Illustrating the service of the bureau's electrical section he told how its engineers broke no less than 20,000 lamps before their rigid requirements for lamps were fulfilled. The electric cap lamp alone is worth the whole cost of the section, he thinks. He prophesied it will some day give the industry a sparkless motor and safer mining machines and that one of its best gifts will be a thoroughly good electric shovel.

The chemical section has done many things for greater mine safety. It can tell in two hours after it receives a sample of air drawn from a sealed off fire section of a mine whether that section is safe to open. From its proximate analyses of coal samples it can determine the explosibility of the dust of that particular coal. Such determinations are dependable warnings to an operator of dangers to be guarded against.

The bureau's experimental mine 13 miles from Pittsburgh, Pa., has tried out almost everything imaginable in coal mining—explosive conditions, gasoline locomotives, underground automobiles.

"The bureau has done so much of direct benefit to mine inspectors," said Dr. Rutledge, "that it is hard to imagine anything else it could do. However, I think it should keep on broadening its scientific investigation. It should have demonstration mines in many fields. It should devote more time to demonstration of the best mining methods or soon our most scientific method of mining—the longwall—will be lost. Field men should supply confidential reports to state inspectors on accidents. I do not mean that the present system of issuing everything only from headquarters should be broken down, but I do believe state men should get confidential reports such as I mentioned."

Further, Dr. Rutledge urged solemnly that a uniform code of mine safety be worked out on the order of the boiler code of this country. There should be uniform methods of marking for all safety investigations also.

President Lambie declared one of the most beneficial things the bureau's engineers could do for the safety of mining would be to develop a machine that will eliminate explosives. If a machine is ever made efficient which can shear, undercut and pull down coal, not only will mines be much safer because roofs will not be loosened by shock, admitting gas and causing falls, but coal will be cleaner and bigger.

Mr. Dalrymple said the "hydraulic cartridge" machine developed in Colorado years ago may some day answer the purpose, especially if the Frick coal interests of Pennsylvania take it up for further development, as they now talk of doing.

W. D. Ryan, of the bureau's field force, spoke at the close of the Wednesday session, dealing with the good feeling that now generally exists between state and bureau men, declaring it should continue always.

Editors Favorable to Anthracite Report of Coal Commission

Most Papers Approve Recommendations—Stand on
Nationalization Commended—Opinion Divided
on Federal Operation in Emergency

BY PAUL WOOTON

Washington Correspondent of *Coal Age*

If newspaper editorials reflect the opinion of the public, the U. S. Coal Commission's report has the approval of the vast majority of the people, for the comment favorable to the report greatly exceeds the criticisms. It is particularly noticeable that a large number of these editorials approve what the Commission has recommended and would go even further in the effort to insure a constant supply of coal. It is not only the newspaper that is elated over the election of Magnus Johnson which advocates doing what the Commission recommends and much more, but vigorous editorials to that end have appeared in the conservative papers of the country—publications which are outspoken against the radical tendencies which have flared up in the Middle West.

The returns from the clipping services indicate that an unusual amount of newspaper space has been given to this report and to editorials commenting on it. With few exceptions, they accept the Commission's belief that the mining and distribution of anthracite are matters which affect the public interest in a legal way and that there is an obligation of the part of mine operators and mine workers to give continuous service.

A few papers characterize the whole report as unfair and as constituting a dangerous precedent in its proposals which require publicity of accounts and otherwise allow the federal arm to be thrust into private business. Some editorials take the ground that the Commission has recommended nothing that is likely to be put into effect and as a consequence has wasted \$600,000 of public money. Almost all of the editorials agree with the Commission's stand on nationalization.

Opinion is very much divided as to whether the President should be empowered to take over the operation of mines during an emergency. The opinion is expressed that the Federal Government would be no more successful in inducing the men to return to work than would be their regular employers. Nearly all editorial writers who touched on that point show skepticism as to the ability of the government to obtain anything like a normal production of coal. Some of the editorials reflect opposition to the compulsory divulgence of so-called business secrets.

Some of the newspapers, not unfriendly to the plan, doubt its feasibility because of the legal difficulties involved in attempting to establish federal control over mines or even to force publicity of accounts. In that connection attention was called to the fact that the Supreme Court of Indiana in passing upon the Fuel Commission Law of that state held in effect that the state has no authority to fix conditions of mining and to set prices on coal since the commodity is likely to be carried in interstate commerce. At about the same time a court in the District of Columbia ruled that the Federal Trade Commission has no right to demand production costs because mining is not interstate commerce.

In accordance with the plan already announced, the Commission has begun the issuance of some of the material on which its anthracite report was based. The first exhibit is the study of earnings of anthracite miners made by Miss Anne Bezanson. Other exhibits will be forthcoming at frequent intervals in the future.

Resume Anthracite Wage Conference

Representatives of the anthracite mine workers and operators resumed their conference at Atlantic City July 23 in an effort to arrange a new contract to replace that now in force, which will expire Aug. 31. The parleys were interrupted for ten days to permit the miners' representatives to attend the biennial convention at Wilkes-Barre.

Brief by Farrington to Coal Commission Blames "Gunmen" for Herrin Massacre

CHICAGO, July 24.—Frank Farrington, president of the Illinois mine workers' union, on July 21 made public a brief he was sending to the United States Coal Commission in answer to the brief of the Bituminous Operators' Special Committee, which condemned the union for its activities in connection with the Herrin massacre. Farrington's reply paints the operator of the Herrin strip mine in dark tones and his gunmen in deepest black. "The operator, W. J. Lester, had no business importing hired killers into a mining neighborhood, peacefully awaiting the end of the 1922 strike," says the brief, "and the gunmen had no business insulting and robbing people on the public highways near the strip mine and otherwise driving the naturally peaceful people of Williamson County to take up arms in self-defense." The authors of the brief express the hope that the slaughter which followed the capture of the mine guards will teach American industry that the day of the hired gunman is over.

Ask Rehearing of Assigned-Car Case

Application for a rehearing in the assigned-car case was made to the Interstate Commerce Commission Wednesday, July 18, by various of the subsidiaries of the United States Steel Corporation. In this application it is contended that the present record is insufficient to enable the commission to reach a fair conclusion in respect to the use of private coal cars by these concerns. The petition points out that not one pound of coal mined by the parties to the request is marketed, sold or shipped in competition with coal mined in the same or in adjacent districts. It is pointed out further that the nature of the manufacturing process requires continuous operation of steel plants. The distances between the plants and their coke ovens on the one hand and the mines on the other require the use of private cars to insure continuity of coal supply.

Counsel for the National Coal Association is engaged in the preparation of an answer to the brief of the railroads in the assigned-car case. The brief is being written by E. S. Ballard, of Butler, Lamb, Foster & Pope, of Chicago, who successfully prosecuted the case which resulted in the recent favorable decision.

Interior Official Denies Federal Coal Plan

A detailed plan for government operation of mines in the anthracite field has been prepared by the Bureau of Mines and Interior Department officials, says a front-page news article printed in the Washington *Evening Star* of Tuesday, July 24. The plan was worked out during the last strike, says the article, but can be put into effect in 24 hours, if needed. Acting Secretary of the Interior Finney authorized the Washington correspondent of *Coal Age* to deny the report absolutely. Further denial was made by Acting Director Dorsey A. Lyon, of the Bureau of Mines.

Alabama Union Fades; Autonomy Abrogated

The United Mine Workers of America abrogated the autonomy of District 20, having jurisdiction over Alabama territory, effective July 1. Inability of the district organization, after more than thirty years of existence, to be self-supporting was the reason assigned for suspending the autonomy of the district organization and the dropping of local officials from the payroll. The International union has placed International representatives in charge of the remaining remnant of union locals. The open shop is more strongly established in Alabama coal mines than ever before in the history of the industry and efforts to organize the mine workers of Alabama effectively has ever been signally ineffective, though the national organization has expended millions of dollars in Alabama on organization work and

backing strikes, none of which was ever won by the union forces.

According to a statement released by the United Mine Workers, the U. S. Coal Commission has been asked by the miners' union to investigate conditions under which Alabama mining companies are said to employ convict labor. A letter made public July 22 by the United Mine Workers, carrying the petition, said that reports, "spread broadcast," indicated that convicts had been "compelled to suffer torture" in order that "non-union mining companies might reap a profit."

In addition, the union's letter asserted that "Alabama non-union coal companies have hammered wages of mine workers down since last year" and lowered costs of coal production, but at the same time had raised the prices of coal. The unnamed concerns were said to be "gouging the public pocketbook in shameless fashion."

Strike Situation in Nova Scotia Clearing

The situation in the bituminous-coal fields of Nova Scotia is "rapidly clearing up," according to a statement made July 22 by John L. Lewis, president of the United Mine Workers. Reports which Lewis has received from Provisional President Barrett indicate that in a dozen of the 100 local unions embraced in the district the miners have voted to return to work in obedience to the orders of the international president, and that in probably two-thirds of the remaining locals referendums have been started to allow every individual miner a chance to express either his allegiance to the authority of the international or his allegiance to the deposed officers of the district.

A factor in the speedy settlement of the Nova Scotia trouble, it was pointed out, was that the strikers are now without funds.

On July 18 President Lewis revoked the charter of District No. 26, embracing the Nova Scotia field. At the same time he removed from office District President Daniel Livingstone, District Vice-President Alexander McIntyre and District Secretary-Treasurer J. B. MacLachlan, and set up a provisional district to function within the jurisdiction of former District 26, under the international union representative, Silby Barrett of Glace Bay.

Lewis instructed union miners in the district to return to work and advised the British Empire Steel Corporation, against which an unauthorized strike has been pending, that the international union has assumed the obligations of the existing joint wage agreement.

The trouble in Nova Scotia started when 8,000 of the 13,000 miners in District 26 two weeks ago went on unauthorized strike to protest the presence of provincial police and militia in the district to watch the property of the British Empire Steel Corporation, Ltd. whose employees are on strike. As soon as he learned of the strike Lewis sent word to his representative to order the men back to work. His orders were ignored.

The miners in the Drumheller coal field of southern Alberta went out on strike on July 13 as a mark of sympathy for the miners in Cape Breton, N. S. High union authority ordered the men back to work until a vote of the whole of the members of the union had been taken, but the men refused to obey the order and still are on strike. The mines have been picketed, but the men operating the pumps are allowed to work.

THE AMERICAN RAILROAD ASSOCIATION has agreed to qualify its recent statement to the effect that there is no shortage of open-top equipment for coal loading. Following the issuance of a statement to that effect, specific instances were cited by the National Coal Association which had been overlooked at the time the statement was prepared.

APPLICATION TO BUILD A 15-MILE BRANCH of railroad to permit of opening of coal mine was made Tuesday by the Okmulgee Northern Ry. Because of the recent action of the I. C. C. denying similar privilege to the Virginian, the applicant presents an argument with the application to the effect that coal could be sold cheaper than that of other mines now served.

Coal Commission Not to Urge Extra Session of Congress; Annual New England Alarm Sets In

John Hays Hammond, chairman of the U. S. Coal Commission, and Commissioner Thomas R. Marshall stated July 22 at Mr. Hammond's home in Gloucester, Mass., that there would be no strike in the anthracite fields next autumn, that the Coal Commission will not urge President Harding to call an extra session of Congress to pass special legislation dealing with the coal situation and that the price of anthracite to New England consumers will not be higher than the prices of the last two years, according to the Boston *Herald*.

Mr. Hammond believes that for the Commission to urge President Harding to call an extra session to deal with the coal situation would be uncalled for and an unwarranted presumption. There is nothing in the present situation which would warrant such action, he said.

"So much publicity has been given the coal industry, cost of labor, margin of profit, wages of labor, etc.," said Chairman Hammond, "that this alone would prove a strong detriment to any such runaway prices as have been named. I do not believe there will be a coal strike."

"The commission has very high hopes," Mr. Marshall said, "that all the former grievances have been forgotten and that the operators and miners realize that operators should receive a decent return on their investment; that the miners should receive a living wage according to the American conception of what that means and that upon that basis there must be uninterrupted operation of the mines to furnish coal to the people of the United States at the cheapest price."

"We have no reason to believe that both operators and miners are not going to reach a conclusion at Atlantic City to keep the mines open and give the people the cheapest possible coal. It is our view that the least interference will promote peace and do the most good."

"If they should lock horns and operations stop, then the commission would seriously take up the question of its duty to lay additional information before the President, not from any party standpoint but from the standpoint of the people of the United States."

The move for a special session of Congress, started by Senator Brookhart, of Iowa, as a plan to deal with the falling price of wheat, was supplemented July 21 by Representative Treadway, of Massachusetts, who said that the same shortage of coal would exist in the New England States next winter as last winter unless Congress acted in a special session on the recommendations of the Coal Commission. Action deferred until the regular session in December, Mr. Treadway said, would be too late.

"I am thoroughly convinced that the only way possible to prevent much suffering next winter is through government supervision of prices and distribution," Mr. Treadway said. "The Coal Fact-Finding Commission's report says that the President in emergencies should take charge of production. I think we should have drastic legislation."

"There is no greater public need than for anthracite coal for domestic use. Electric light rates and distribution are regulated. Water, car lines and freight rates are regulated. There is as great a need for fuel as for any of these public utilities. Consequently, the federal government must step in and see that the people are dealt with fairly by those having the stocks of coal."

"I feel that the subject is so important that whether there is a strike or not, the President should call Congress into special session on his return. I will have legislation drafted ready for consideration as soon as Congress reassembles. I will see the President as soon as possible and lay before him the facts as I find them and urge remedial legislation before cold weather."

Factional Row in District 1 Settled; Brennan Voluntarily Withdraws

William J. Brennan, president of District 1, in abandoning his intention of contesting the election of Rinaldo Cappellini, insurgent leader, who won the district presidency by a plurality of 9,719 votes in the election last month, brought to an end—for the present—the factional fight that threatened to disrupt the biennial convention at Wilkes-Barre last week. Brennan welcomed peace when it was evident that he lacked votes in the convention, Cappellini forces being greatly in the majority.

It was the plan of the Brennan forces to attack Cappellini's election on the floor of the convention, on the ground that under the constitution of the organization he was ineligible to office, Brennan having ousted him as district organizer some months ago. A resolution was prepared and submitted to the resolutions committee July 17 asking that Cappellini be barred from office, but this resolution was withdrawn the next day and the Brennan plan of attack abandoned.

The insurgents forced an issue when Enoch Williams, secretary-treasurer of the district, presented a motion that the convention adopted, making the appeal of Cappellini for reinstatement to the office of district organizer a special order of business. Then the Brennan resolution was withdrawn from committee.

Cappellini asked the 375 delegates assembled to undo that which Brennan did in removing him from office. The appeal easily got a majority of votes and with Cappellini reinstated as a district organizer the last prop was knocked from under the threatened contest of Brennan.

Settlement of the factional row in District 1 means that Rinaldo Cappellini, regarded as the leading agitator among anthracite workers, will sit as a member of the miners' section of the subcommittee negotiating the new wage contract after Aug. 1. Despite his record, however, it is gen-

erally understood that Cappellini will uphold Lewis in the present negotiations. The fact that William J. Brennan, former president of District 1, whose friends opposed seating Cappellini, voluntarily withdrew from the content is regarded as supporting the theory that Cappellini will not be a disturbing factor.

Defense in Dock Case Is Now Starting Before Federal Trade Commission

The evidence for the defense is being started in the Minnesota hearings before the Federal Trade Commission in the charges against the dock organization. The prosecution was heard through all of June and a few days of July.

The hearings before the Federal Trade Commission continued up to July 9 with evidence to sustain the charges against the dock association. At that time an adjournment was taken to Duluth to take testimony there. Following, the defense was given a chance to disprove or explain the circumstances of the evidence offered against them. The defense assert that they will be able to show much of the evidence against them to be imagination of a hectic variety.

It is possible that there will be some new orders issued to the coal trade, such as requiring them to sell to municipalities which seek to buy, instead of leaving the business to the local retailer; there may be an opening up of purchasing to anyone with the money to pay for a carload. This would be objectionable to the complaining association, which would wish to maintain the field for the legitimate dealers as much as the dock association might.

At Duluth evidence was taken from dealers and operators of commercial buildings in an effort to establish that dock coal is sold at lower prices in Minneapolis than in Duluth. Dock men attributed the mixed situation in the trade to the southern Illinois mines being able to lay down coal cheaper at Minneapolis than the dock coal owing to the railroad freight rates being in their favor.

Production and the Market

Weekly Review

While prices of bituminous coal are hugging the bottom for the season, those for domestic sizes of anthracite quoted by independent producers are getting stronger every day. The pressure on industries and railroads to buy and store soft coal this summer is being relentlessly applied by the Federal Fuel Distributor and the Department of Commerce at Washington. The result is a steady production of soft coal since the first of the year averaging about 10,500,000 tons per week.

Buying has been so quietly conducted and the coal so judiciously selected that the prices on the open market have declined to a level that is now regarded as the bottom. *Coal Age* Index of spot prices of bituminous coal at the mines was 197 on July 23, a drop of one point in one week. The corresponding average price was \$2.38 per ton, which is admittedly below the normal average cost of production, although it does not follow that all coal sold at these prices represents a loss to the producer. The higher cost mines that are not protected by contracts have largely ceased production in the summer months. There is very little spot buying at this time, and it is not expected that there will be any activity in the market until late August or early September. Prices of anthracite steam sizes have followed bituminous coal prices downward. The large companies are storing steam sizes and the independents selling well below circular.

BITUMINOUS MARKET DOWN; ANTHRACITE UP

In contrast with the sluggish bituminous-coal market is the activity in the domestic sizes of anthracite, where quotations as high as those in the middle of last winter have been reached in the last week in a few instances. Despite the assurance of Chairman Hammond of the Coal Commission to New England consumers, as reported in the press this week, that prices of company coal would rise no higher next winter, there

is a remarkably strong undercurrent in the trade and throughout the anthracite region that concessions will be made to the wage demands of the miners, increasing the cost of production and the price to the consumer. Following the slump in production caused by the July 4 holiday, the output of hard coal rose again to over 2,000,000 tons in the second week in July and slightly less than 2,000,000 in the third week.

Production of bituminous coal in the first six months of this year was 273,270,000 tons, a figure, according to the Geological Survey, which has been exceeded but

LAKE COAL DUMPED

(Net Tons)

	Week Ended July 23	Season to July 23
Cargo	1,058,767	12,793,996
Fuel	57,806	637,124
Total	1,116,573	13,431,120

once—in 1918—in the past ten years. In the Middle West buying of domestic lump by the retail trade has practically ceased and the market continues its downward trend. Railroads in that territory have about completed their storage program and many industries are buying only as they need the coal. Conditions are dull in New England. Receipts of soft coal are stead-

Estimates of Production

(Net Tons)

BITUMINOUS

	1922	1923
June 30	5,226,000	10,458,000

(a) Subject to revision. (b) Revised from last report.

ily diminishing and there is nothing in the general situation to indicate an improvement for some time. Textile mills are shutting down or curtailing operations and buying no coal. A survey of 1,100 industrial plants throughout New England made early this month showed 300 plants using oil fuel and the remainder with an average of 90 days' reserve coal stored away in their stockpiles.

Producers are not accepting orders at present prices for any except immediate shipments, believing that prices will react upward at the first indication of buying.

Activity in the export market is mostly centered in orders from Italy, Holland and South America. France is out of the market and the flurry of Canadian buying is over. Some English coal is being received but it is on old contracts. Dumpings at Baltimore for the first half of July were 151,377 tons of cargo and bunker coal. During the week ended July 19, 357,979 net tons of coal was dumped at Hampton Roads for all accounts, as compared with 348,130 tons in the previous week.

Chicago Market Softens Further

The general trend of markets in the Middle West continues downward without much relief in any quarter. Enough coal gets into demurrage to spatter distress prices all over the market at Chicago. Good southern Illinois screenings are hard to move at \$1.50, especially since a tremendous stock of them, stored since spring, has just been unloaded at \$1.15. Central Illinois fines, produced in a little greater volume during the past two weeks than a month ago because a few more mines have reopened, drag at \$1.40, and so it goes. There is no demand for domestic sizes and prices range rather crazily from the Franklin County circular of \$4.35, which nobody gets, down to \$2.75 for certain Williamson County independent lump and egg. On the whole the market is at its soggiest without much hope for improvement for another two weeks at least.

In the Standard field business is unusually quiet. There is practically no demand for anything. Screenings were reported as selling as low as 85¢@90¢ this week, which forced the price of 2-in. lump from \$2.25 to \$2.40, 6-in. from \$2.50 to \$2.75, steam egg \$2.15 and steam nut \$1.85 to \$2. Mine-run still continues \$1.85. A little railroad coal is moving out, but everything is slow.

In St. Louis business is as nearly dead as it could be.

Coal Age Index of Spot Prices Bituminous Coal F.O.B. Mines

	1923			1922
	July 23	July 16	July 9	July 24
Index	197	198	197	460
Weighted average price.....	\$2.38	\$2.40	\$2.38	\$5.57

This diagram shows the relative, not the actual, prices on fourteen coals, representative of nearly 90 per cent of the bituminous output of the United States weighted first with respect to the proportions each of slack, prepared and run-of-mine normally shipped, and second, with respect to the tonnage of each normally produced. The average thus obtained was compared with the average for the twelve months ended June, 1914, as 100, after the manner adopted in the report on "Prices of Coal and Coke, 1913, 1918," published by the Geological Survey and the War Industries Board.

Deliveries of anthracite, smokeless and coke, good until a week ago, have practically stopped. Hot weather has done its worst. Country business around St. Louis, both steam and domestic, is dead.

Kentucky Cuts Prices to Get Business

In western Kentucky prices on prepared sizes are being held quite well though there is some price cutting to get business. This is largely blamed on cancellations, whereas it is actually due to loading coal on prospects, resulting in distress stuff that has to be moved.

Screenings, which had been expected to improve, have worked lower, and are now coming into competition with some good grade of eastern Kentucky screenings, which are quoted by jobbers to industrial consumers on the Louisville market at 75c. f.o.b. mines. Western Kentucky is asking 90c., as a lower freight rate to Louisville gives that field an advantage.

More than half of Kentucky's mines are down. Many dealers and others who stocked regret it now because of prevailing low prices today. Operators blame dealers for trying to take too wide a margin, while letting producers be charged with causing high coal prices. Quotations on domestic eastern Kentucky average \$8 and on Western Kentucky \$7.

Northwest Takes Anthracite

Anthracite movement from Duluth and Superior docks has been improving because of strike talk. Current quotations are as follows: Egg, \$12.50; stove, \$12.80; nut, \$12.85; pea, \$11, and buckwheat, \$8.50. The Duluth market in bituminous is slow with prices steady, as follows: Youghiogheny and Hocking lump, \$6.50; run-of-pile, \$5.50; screenings, \$4, with some docks quoting screenings carried over from last season at \$3.85. Split lump or stove is \$7.50; run-of-pile, \$6.50; screenings, \$4.50; Kentucky lump, \$8.50; run-of-pile, \$7.25, and screenings, \$5.25; Elkhorn lump or egg, \$9; run-of-pile \$7.50; screenings \$5.75; Pocahontas, lump or stove, \$10; mine-run, \$7.50, and screenings, \$6.50.

The Milwaukee coal market is stagnant. City dealers are having a smattering of trade, but jobbers say business is dead in the country. Everybody thinks there will be plenty of coal the coming winter, and it is this feeling that checks the demand.

Western Business Is Flat

Western markets show no life whatever. In the Kansas and Oklahoma regions there is no demand for anything and "no-bills" at the Kansas mines run over 200 cars steadily. Summer storage price offers have been almost futile all the way from Kansas City to Salt Lake City, where they were supposed to have been cancelled July 1 but were not because of poor business at any price. In Utah they are already talking of a coming car shortage.

No Interest Seen in Ohio Markets

Buying is at a low point in the Columbus market, as neither steam users nor retail dealers are disposed to stock up. Buying for present needs seem to be the general rule. Railroads are taking the usual percentage while some buying by utilities is reported. Considerable distress coal is reported on the market which is being let go at low prices. The Southern Ohio Coal Exchange reports production of 123,000 tons from 442 mines in the Southern Ohio field during the week ended July 7. There is plenty of coal in the Cincinnati market, but there is a lack of interest in offerings. Some sales are being made of all rail coal to the Northwest. West Virginia 2-in. lump is quoted at \$2.25@2.50 as compared with \$2.50@3 last week and southeastern Kentucky 2-in. lump at \$2.25@2.50 as compared with \$2.50@3 last week. Steam demand at Cleveland continues quiet while retail dealers are confined pretty much to smokeless fuels and anthracite. As a result of railroad fuel inquiries in northern and southern West Virginia many producers are inclined to believe that heavier railroad-fuel buying will stimulate business a little later in the season. Production in Virginia is keeping up well, ranging around 60 per cent of capacity.

The market at Pittsburgh seems to have recovered from the depressing influence caused recently by curtailment of purchases of byproduct steam and gas coal, particularly the last named, by the steel mills. The mills are running at a lower rate than formerly and are producing only for immediate or very early requirements. The situation at Buffalo continues quiet. There is no buying. For the week ended July 15 loadings in the central Pennsylvania district were 18,700 cars, as compared with 15,503 cars the previous week. During the first six months of 1923 production in central Pennsylvania was 26,075,675 tons.

New England in Grip of Doldrums

In New England the market is still in the doldrums. Both all-rail and by water receipts are steadily diminishing and the general industrial situation is not favorable to any increased demand during the next month or so. The textile mills in particular are suffering from the light market for finished goods and throughout the territory shutdowns and curtailments are the rule. The effect upon steam coal is depressing, and spot sales are few and only for small tonnages.

For distribution inland from ports like Providence, Boston and Portland there is only scattering inquiry and except for occasional "market cargoes" prices are around

\$7 per gross ton on cars. There have been part cargo-lots forced on the market at a considerably less figure. The Hampton Roads factors continue to dominate areas adjacent to tidewater to the extent that they get what business is offering, but the aggregate tonnage is small.

Navy standard grades of Pocahontas and New River are being held more or less firmly at Hampton Roads, the current range of price being \$5.50@\$5.75 per gross ton f.o.b. vessel. Dumpings are confined, however, for the most part to deliveries on contract, almost no coal having changed hands recently on spot business.

In central Pennsylvania the situation varies very little. A few of the more favorably known coals have been enjoying fair business, especially on long-term contracts, but the great bulk of Clearfields and Cambrias find it hard going. The extra tonnage that accrued to central Pennsylvania while Hampton Roads prices were at \$6.75@\$7 is now rapidly falling off and July figures will show a marked contrast with those of May. In all directions steam coal seems to be a drug on the market with slight prospect of improvement in the near future.

Only Bargain Hunters in New York Market

The New York tidewater market is dull. Shipments are not heavy and quotations remain on about last week's basis. Consumers are not taking in heavy tonnages but are picking up bargain lots at low prices. There is a slight change for the better in the Philadelphia tidewater market, but it seems to be only temporary. The Baltimore trade feels as if better conditions are almost at hand. There have been inquiries from large concerns as to autumn and winter needs. Trade at Birmingham is slow and consumers are showing little interest. Several thousand tons of coal are being loaded at Mobile for West Indian points. Domestic buying is fairly active for high-grade coals.

Lake Movement Continues Apace

Better lake movement is expected at Columbus during August than is now being had. Demand for lake coal at Pittsburgh has improved, while 138,100 net tons of anthracite were shipped from Buffalo last week, of which 77,000 tons cleared for Duluth and Superior, 15,000 tons for Chicago, 33,300 tons for Milwaukee and 12,800 tons for Fort William. More hard coal has been received at Milwaukee so far this season than was received during the entire season last year.

Demand for Domestic Anthracite Mounts

Demand for anthracite domestic coals has increased considerably. Retail dealers seem to be receiving larger shipments, which are being delivered to consumers as rapidly as possible. Chestnut coal, next to pea size, is the easiest of the larger coals. Strong demand and lack of coals feature the Philadelphia market. Consumers in all sections are being urged to lay in their supply of coal, which only adds to the pressure already placed on the dealers. Movement of hard coal to Baltimore so far this month has been a disappointment to the trade there. Retail dealers have orders on their books far in excess of receipts so far.

"In the pick-up after the holiday anthracite production passed the two-million ton mark in the week ended July 14," says the Geological Survey. "On the basis of 39,221 cars reported loaded by the nine principal anthracite

carriers, the total production, including mine fuel, local sales and the output of washeries and dredges, is estimated at 2,051,000 tons. Early returns for the week July 16-21 indicate a lower rate of output and a probable yield of about 1,900,000 tons."

BIDS FOR FURNISHING AND DELIVERING COAL to the various camps, arsenals, forts and buildings under the jurisdiction of the U. S. Army along the Atlantic seaboard as far south as Virginia are being received by the Quartermaster's Department, Brooklyn. The total amount required is 86,061 net tons of anthracite, 52,453 net tons bituminous and 355 net tons of coke. The bids have been divided into three parts. The first part, covering the New England States and Forts Michie, Terry and Wright, in New York State, was opened July 25 and called for 12,391 net tons of egg coal, 5,439 tons stove coal, 4,348 tons chestnut coal, 5,435 tons bituminous mine-run and 450 tons bituminous 2-in. lump coal. The second part will be opened on July 31 and covers New York, New Jersey and Delaware. On Aug. 6 the third batch of bids will be opened for camps and other army buildings in Pennsylvania, Maryland and Virginia. Deliveries on all contracts are to run until June 30, 1924, although in most cases the entire tonnage will be called for by Sept. 1 of this year.

Foreign Market And Export News

British Coal Production Further Declines; Welsh Miners Get Wage Increase

Another decline in Great Britain's coal output was recorded during the week ended July 7 when production was reported at 5,306,000 tons, says a cable to *Coal Age*. This was a decline of 95,000 tons when compared with the previous week.

The Welsh coal market is steadier. Following a good deal of contract activity, the mines have become better booked up, and the tone is firmer. Market conditions have encouraged buyers to come forward more freely, and business with France, South America, and the Continent is showing a steady improvement.

Welsh miners have received a wage raise of 9.62 per cent, making the wage-rate 37.62 per cent over the standard of 1915. For a year and a half now the wage-rate has been on the minimum of 28 per cent above the standard.

The Newcastle market is much firmer. Germany is inquiring on a large scale. The demand from other European countries with the exception of Italy is increasing.

German Coal Situation

The marked reverse which the coal market in the German interior suffered, starting at the first days of April, equally affecting domestic and imported coal has given place to a brisker tone. This reverse was caused partly by the business slump, which greatly reduced industrial activity and by expectations of a near end of the Ruhr blockade. Revival of business on the one hand and the growing conviction on the other, that no political change can be expected in the near future has again stimulated the demand with the result that lively business on the import market is being looked for.

The tendency is getting stronger not to rely on Great Britain alone but extend the import business to other markets if only as a stabilizing factor. The shipments so far obtained from the United States have, as far as can be heard, given full satisfaction as regards quality, which has been greatly

instrumental to wiping out the prejudice against American coal, caused by previous experiences. It is therefore more than likely that the chief coal importers will in the future exhibit an increased activity on the American market.

Export Clearances, Week Ended July 21, 1923.

Demand at Hampton Roads Quiet

Demand for coal fell to a minimum at Hampton Roads last week, following a brief revival in trade during the week before. Foreign shipments were brisk, but largely on old contracts which are rapidly being completed.

Large shipments to Canada, which were forecast, did not materialize to any great extent. Coastwise trade was very dull, with bunkers only moderately active.

News Items From Field and Trade

ALABAMA

Officers and directors of the DeBardeleben Coal Corporation, recently formed by the merger of the Corona Coal Co., DeBardeleben Coal Co., and Empire Coal Co., have been announced as follows: Henry T. DeBardeleben, president; Walter Moore, vice-president; Milton Fies, operating vice-president; G. M. Bowers, secretary-treasurer. The above officers with the following additions form the board of directors: W. F. Hull, New York; Morris Adler, Eugene Fies, Julien Adler, W. W. Gradford, Birmingham; T. Johnson Ward, Henry Vaughan, Harry Townsend, Philadelphia. The DeBardeleben corporation assumes all the contracts of the merged companies. The new company will give special attention to bunker and export trade at Southern ports, where ample facilities are provided for the storage of coal and bunkering of ships with dispatch. The Birmingham offices of the company will be located on the tenth floor of First National Bank Building in quarters formerly used by the Corona Coal Co.

Alabama produced more coal during the first six months of 1923 than during any similar period for the past five years, according to figures compiled by the Alabama Mining Institute from weekly reports received by that organization. The total for the half year was 9,737,000 net tons, which exceeds the 1922 output by 17 per cent and that for 1921 by 52 per cent for the same period. March was the banner month, with an output of 1,842,000 tons, and also held the weekly record of 416,000 tons March 31. Production for the year is on a basis of 19,473,000 tons. The above figures are conservative, a number of small operations not making weekly reports to the Institute regularly, if at all.

ILLINOIS

The Mt. Olove & Staunton Coal Co., Staunton, has inaugurated the plan of **paying by check instead of cash**, following the hold-up in Staunton recently, when \$45,000 of the company's payroll money was stolen. Checks will be drawn on the Staunton National Bank.

James Miller, who is sinking a shaft on the Orville Taylor farm in the Sangamon valley, near Springfield, has struck a 3-ft vein of coal at a depth of 39 ft.

The old Citizens Mine A, near Springfield, will be taken over by the Central Illinois Coal & Mining Company, a new organization. The mine is located four miles west of Springfield on the C. P. & St. L. R.R. and has been closed down for the past two years. It is expected that 150 men will be employed. The opening of this mine will place in operation all of the fourteen mines in the Springfield switching district and will bring the total capacity of the mines around Springfield to 23,000 tons. F. J. Devlin is mine manager for the new company. James P. Hickey and W. M. Ryan are officials.

The Globe Coal Co., has increased its capital stock from \$1,000,000 to \$3,000,000.

The Abbott Coal Mining Co., of Pekin, has been incorporated for \$10,000 by L. C. and C. J. Abbott, H. C. Gulen, Frank Keays and J. R. Cunningham to sink a shaft and operate a mine.

Plans have been completed and according to reliable information work will be started within the next few days on the sinking of a **new coal mine two miles north of Hurst**, just across the Jackson County line in Williamson County. The Western Coal & Mining Co. with headquarters in Murphysboro will sink the shaft. According to present plans the mine will be one of the largest in the vicinity and will be known as mine No. 3, the company operating one under the name of mine No. 2 at present. In order to provide homes for miners at the new mine the company is planning to erect 150 houses on company property near the new shaft. Approximately 600 men are working at Mine No. 2 and this new mine is expected to employ as many or more when in full operation.

Mine No. 5 of the Southern Gem Coal Corporation at Pinckneyville has been

shut down indefinitely by officials of that company. The orders scheduled for the mine probably will be taken care of from Mine No. 6 of that company. Prior to the shutdown the men working at the shaft had been on a "wildcat strike" over the first engineer of the mine. The men claimed the engineer was incompetent and demanded his discharge. However, the company did not grant the demands.

The Pontiac Coal Mining Co., of Pontiac, has been incorporated with capital of \$50,000 to operate coal mines. The incorporators are C. J. Fromgen, H. H. Webb and C. M. Webb.

The Phillis & Benson Coal Mining Co., operating six miles west of Geneseo, has sunk another shaft, reaching a 5-ft. vein of coal. Mining is expected to begin about Aug. 1.

The Taylor mine near O'Fallon has been forced into further idleness since having been shutdown for some time during which the main shaft was repaired. When men went inside the mine to clean up and make ready for operating, they found fire in the workings. No cause has been assigned for the fire though shots fired before the shutdown may have started the blaze.

The Shed Coal Co., Marion Ill., has been incorporated with capital of \$100,000 by E. E. Allen, P. H. Williams, and H. J. Faust.

INDIANA

More than 20,000 people were said to have witnessed the **Indiana State first aid meet** at Sullivan, July 7. It was the largest event of its kind in the state's history. **The team from Miami Coal Co.'s No. 10 mine won first place** in the contest and will go to the International First-Aid Meet in Salt Lake City, Utah, Aug. 27-29, representing the United Mine Workers of Indiana. Its average was 99½ per cent. The team from Jackson Hill No. 4 mine won second place with a score of 99½ per cent, and will go to Salt Lake City representing the Indiana Bituminous Coal Operators' Association. The scores of other competing teams at Sullivan follow: Jackson Hill mine, West Terre Haute, 98½; Peerless mine, Sullivan, 98½; Miami mine, Clinton, 98½; Jackson Hill mine No. 7, Shelburn, 98; Vandalia mine, Sullivan, 97.8½; Clinton mine, Clinton, 97.6½; Glendora Mine, Vincennes, 97½; J. K. Dering mine, Clinton, 97½; Pan Handle mine, Blacknell, 96.8½; Miami mine No. 8, Clinton, 96½; Knox Consolidated mine No. 3, Bicknell, 96½; Knox Consolidated mine No. 2, Bicknell, 96.3½; Vigo mine, Sullivan, 96.3½; Vermillion mine, Clinton, 96½; Vandalia mine, Clinton, 96½; Howe-Coulter mine, Bicknell, 95½; Knox Consolidated mine No. 4, 95½; Knox Consolidated mine No. 1, team No. 2, 95½; Vandalia mine No. 23, Sullivan, 95; Carlisle mine, Carlisle, 94.8½; Knox Consolidated mine No. 1, team No. 1, 94½; Vandalia mine No. 12, Sullivan, 94½; Templeton mine, Sullivan, 94.1½.

Seventy-five men were thrown out of work when the tippie, machinery, surrounding buildings and two coal cars of the mine owned by the **Sherwood Coal Co.**, of Illinois, ten miles west of Linton, burned. The loss, which was partly covered by insurance, may reach \$75,000. It was a spectacular fire and drew thousands of spectators. Little was saved from the burning structure. Officials of the company said that new surface buildings and machinery would be built at once.

KENTUCKY

The Golden Decker Coal Co., of Barbourville, has filed amended articles, increasing capital stock from \$10,000 to \$50,000.

The White Coal Co., an operating organization of Whick, in Breathitt County has been chartered by M. G. Yingling, J. R. White and Charles Byrd.

It is reported from eastern Kentucky that the **Kentucky & West Virginia Power Co.** will extend its line to Logan, W. Va.,

in the coal fields, and from there connection will be made to Charleston, where 50,000 people are now being served by the parent company, the American Gas & Electric Co. From Charleston it is planned to extend to the manufacturing town of Wheeling. The company after a few short years' operation in eastern Kentucky is supplying current to several towns and a large number of operators in the Elkhorn-Hazard fields.

The Inland Waterways Co., of Louisville, which controls mines on the Kentucky River and river equipment for transporting coal, oil, etc., has started work on combination rail and river terminals at Jeffersonville, Ind., across the river from Louisville, where property is being cleared for that purpose. The company is also starting erection of terminals at Louisville, where temporary equipment has been in use.

The Standard Oil Co., of Kentucky, which has a large underwater or submergible concrete storage pit at its Riverside Refinery, Louisville, this spring enlarged the capacity of the pit to 400 cars, and reports that the pit is now fully stocked.

C. F. Richardson, of the West Kentucky Coal Co., Sturgis, Ky., is one of the incorporators of the Bank of Sturgis, capitalized at \$15,000.

V. M. Lackey, secretary-treasurer of the Dixie Fuel Co., jobbers, and the Phoenix Coal Mining Co. and Douglas Coal Mining Co., Louisville, will be married on July 31, at Nashville, Tenn., to Miss Mildred Adel Harrington, of that city.

Records of cars furnished in western Kentucky for July to date show that the **Illinois Central R.R. has a surplus, with 118.2 per cent reported.** The Louisville & Nashville R.R. showed 68.2 per cent on its Owensboro division and 98 per cent on its Henderson division. Eastern Kentucky mines are getting all the cars needed, due to lack of demand, light loading and the fact that many mines are down.

M. M. Kling, head of the Louisville Coal & Coke Co., Louisville, who left the city a few months ago to make his home in Oakland, Cal., has sold his interest to his partner, R. C. Eyl, who has been in active charge, and to John L. Sullivan and J. L. Timmel. Eyl becomes president and treasurer, while Sullivan is vice-president; and Timmel is secretary and sales manager. Yard and offices are located at Clay and Fulton streets, with a sales office at 718 East Market street.

It is reported that J. W. Reedy and associates have arranged for a new coal development on Carrs Fork, in Knott County, near Whitesburg, where the Louisville & Nashville R.R. is said to be planning an extension of its lines.

From Hartford, on July 14, it was reported that **Opal Wells**, 19 years of age, son of Charles W. Wells, coal operator and former Mayor of Central City, was shot and killed by Charles W. Scroggins, garage mechanic, following an argument concerning the right of Scroggins to pass Wells on the road at a narrow point.

MINNESOTA

The State Railroad and Warehouse Commission has issued a circular urging all consumers to buy coal early, to avert a congestion in the fall and winter.

The **Reeves Coal & Dock Co.**, Minneapolis, has contracted with the Haynes Coal Co., Haynes, N. D., to take the entire output of its lignite mines for five years, with a minimum annual production of 100,000 tons.

The Inland Coal & Dock Co. has let a contract for an addition of 500 ft. to its dock at Duluth to R. C. Buck, Inc., of Superior. With this addition the dock will be 3,500 ft. long and 350 ft. wide, and will afford a bituminous storage capacity of 700,000 tons. The extension will be of concrete and its cost will be \$80,000. It is expected to be completed by early next October.

The City of Two Harbors has placed an order for 5,000 tons of Youghogheny coal for the use of its municipal coal yard with the Valley Camp Coal Co. at \$5.54 a ton. It is understood that the city's price to consumers will be \$10 a ton.

Receipts of coal at the head of the Lakes docks were in good volume during June. Unloading of bituminous were reported at 1,849,400 tons and of anthracite of 224,300 tons. That brought receipts since the opening of the navigation season to June 30 up to 3,480,800 tons of bituminous and 431,900 tons of anthracite. During the same period in 1922, owing to the miners' strike, anthracite receipts were only 5,000 tons and bituminous 286,600 tons.

MISSOURI

Pierre Quinn has surveyed a coal mine on the Choriton lease near Columbia and will open another shaft east of the present one. The present shaft is about 40 ft. deep and the new shaft is to be opened about 1,100 ft. east of it.

John A. Sargent was appointed general manager of the coal department of the Central Coal & Coke Co., Kansas City, July 18, succeeding to the job vacated several months ago by the resignation of Harry N. Taylor to become president of the United States Distributing Co. Mr. Sargent was general sales manager and traffic manager of the Central, and since the resignation of Mr. Taylor had been handling much of the work of the general manager's office as well. Before going to the Central in 1902 Mr. Sargent was in railroad work. No successor to Mr. Sargent in either the sales or the traffic department of the company has been named. It has been announced that he will continue in direct supervision of those departments.

NEW YORK

The Cortright Coal Co., of Philadelphia, has established offices in New York City, with W. J. Borden, who is well known to the local trade, in charge. The company is located on the eighth floor of 1 Broadway.

Dividends declared and awaiting payment, as reported currently in *The Analyst*, include the following coal companies:

Company	Rate	Period	Payable	Books Close
Burns Bros. A.....	\$2 50	Q	Aug. 15	Aug. 1
Burns Bros. B.....	50c.	Q	Aug. 15	Aug. 1
Burns Bros. pr. pf....	13	Q	Aug. 15	Aug. 1
C. Wilm. & F. Coal pf.	13	Q	Aug. 1	July 16
Dominion Coal pf....	4	Q	Aug. 1	July 12
Hillman C. & C. Co., 5% pf.....	14 1/2	Q	July 25	July 14
Hillman C. & C. Co., 7% pf.....	12	Q	July 25	July 14
Ind. & Ill. Coal Corp. pf.	3 1/2	..	July 16	July 9

OHIO

The Carroll Coal Co., Cleveland, has been incorporated with a capital of \$100,000 to mine and sell coal. The incorporators are Louis G. Carroll, John L. Dowling, Edward L. Brady, Frances H. Devlyn and Richard J. Moriarty.

Quite a few operating companies have been chartered in Ohio recently, showing some development work going forward in various Ohio producing fields. Among the number was the Old Minglewood Coal Co., of Massillon, with an authorized capital of \$20,000 to operate in the Coshocton field. Perry A. Keun, William H. Snyder, A. W. Erickson, Charles Beiner and A. W. Inman are the incorporators.

OKLAHOMA

The Rock Creek Coal Mine Co., of Panama, has let the contract to the Oklahoma Gas & Electric Co. to electrify its mine located on the Bedwell No. 2 lease, installing pumps, fans and coal cutters.

PENNSYLVANIA

Reports from the annual sales convention of the International Fuel & Iron Corp., of Pittsburgh, June 1 and 2, show the biggest business year to date in the history of the company. The convention was attended by twenty-two representatives of district and local sales offices throughout the country who came to Pittsburgh for an informal meeting to discuss present and future problems of the company and of coal industry. The company announced that May tonnage was the largest in the history of the company, and that June bookings indicate another record month. Officials state that the company's bookings for the year will be over two and a half million tons of their own coal and about an equal tonnage from outside sources.

The Pittsburgh Testing Laboratory announces the appointment of F. H. Rood as engineer of tests with headquarters at Pittsburgh. Mr. Rood is a civil engineer, graduate of Syracuse University. For many years he was engineer of tests for the New York State Highway Commission; for three years was assistant engineer of tests, Pittsburgh Testing Laboratory and for two years a research engineer with the U. S. Bureau of Public Roads.

One hundred and fifty employees of the

Bertha-Consumers Company, including all branch sales managers and mine superintendents, met with the Pittsburgh office personnel at a company luncheon July 7 in the Fort Pitt Hotel. W. L. Stewart, chairman of the board of directors, was toastmaster and the principal address was made by John H. Jones, president of the Bertha-Consumers Company. Other speakers included W. M. Furey, a stockholder of the company and former president of the Chamber of Commerce, and Captain M. Steidle of the mining department of Carnegie Institute of Technology, as well as a number of the staff of the Bertha-Consumers Company.

Four bills relating to mine laws of the state were vetoed by Governor Pinchot on July 14. All were sponsored by Senator Joseph O. Clark, Indiana County. The veto messages were similar in that all of them stated that the bills were unnecessary.

Fifty men from the mines enrolled in the five weeks' summer course in coal mining at State College. Two are operators, two are coal salesmen and the rest are miners and officials, mostly from the Pennsylvania bituminous regions. Several of the younger men are seriously considering a four-year course at State College.

F. A. Coffroth, a son of E. B. Coffroth, Somerset, has been named as superintendent of the Briar Hill Coal & Coke Co., in Fayette County. He has been associated with the Briar Hill company in various capacities for many years.

The fourth annual first-aid contest of the Bertha-Consumers Co., Pittsburgh, will be held on the grounds of the Pittsburgh Station, U. S. Bureau of Mines, at 2 p.m., Aug. 11. The fourteen competing teams will represent the company's mines in Pennsylvania, West Virginia, Ohio and Kentucky.

After being idle two days, eight hundred miners resumed work July 13 at Maxwell No. 20 colliery of the Lehigh & Wilkes-Barre Coal Co. Their strike was settled at a meeting held by the local union. The men passed their grievance on to a committee of mine workers, who will confer with company officials.

P. J. Moore, mine inspector of the Second Inspection District, with headquarters at Carbondale, in his report for 1922 says 1,956,624 tons of coal was produced and that 7,883 men and boys are employed in and about the mines in that district. Of the coal produced 1,784,323 tons was shipped. There were 2,300 tons of coal produced by electrical machines. Nine fatal accidents occurred inside the mines during the year, and one outside. There are 35 mines, including strippings, in the district, and during the year two new mines were opened and two old mines abandoned.

The Scranton and the Wilkes-Barre mine-cave situation made no progress this year so far as legislation is concerned. While the Legislature, which two years ago passed unconstitutional bills to relieve the situation, again provided two other measures this year, the Davis-Fowler bills, Governor Pinchot vetoed both bills July 12. In his veto message the Governor said that lack of state revenues compelled him reluctantly to withhold his approval from the bills. The Legislature, he said, did not provide sufficient money for all meritorious appropriation measures and for that reason he was compelled to veto many bills.

WEST VIRGINIA

The Kentucky & West Virginia Power Co., Logan, is installing Westinghouse alternating-current motors and equipment to drive three new stocker clinker grinders. The A. C. motor circuits are provided with starting switches, series trip coils with inverse time-element attachments and low-voltage release coils.

It is reported that the Pond Creek Pocahontas Coal Co. has taken over additional properties in West Virginia. The mines, which are on the main line of the Norfolk & Western Ry., and which are in non-union territory, are said to contain approximately 5,000,000 tons of high grade Pocahontas coal.

J. C. Bryndon and H. L. Gandy, president and executive secretary, respectively, of the National Coal Association, were among those in attendance at the meeting of the Virginia Coal Operators' Association at Norton.

Frank B. Carpenter, formerly electrical engineer with the West Virginia Engineering Co., has resigned and been appointed electrical engineer for the J. C. Sullivan mining interests of West Virginia.

The injunction granted by the late Judge A. G. Dayton, of the U. S. Court for the northern district of West Virginia, in the case of the West Virginia-Pittsburgh Coal Co. against John P. White et al. in 1913 has been perpetuated by Judge Dayton's successor, Judge W. E. Baker. Under the terms of the decree granted the United Mine Workers are enjoined from interfering with the employees of the West Virginia-Pittsburgh Coal Co. and are prohibited from attempting to organize the employees of the company.

The Marshall Coal Co. suffered a loss of about \$45,000 when fire broke out in a conveyor at the company's mine about one mile west of Mount Clare, in Harrison County. The property destroyed includes one conveyor, conveyor shed and steam engine; one headhouse, head tipples and equipment; one supply house, including supplies; one company boarding house and three mine cars.

The new store building of the West Virginia Coal & Coke Co., which is being erected at Norton at a cost of \$25,000, is now under roof and will be ready for occupancy by the middle of September. The company also has under construction a new office building at the same operation and that building is also under roof. It will cost \$10,000. Plans are being formulated by this company for the rebuilding of the mine tipples at Junior, destroyed by fire late in May.

Early in July there was a strike of 260 miners of Cleveland & Morgantown Coal Co. plant at Pursglove, one of the largest in the Scott's Run field. After being out of the mines for about a week the strikers returned to work on July 14. It was agreed, it is understood, that the miners should return to work under the old working conditions. J. L. Studdard, sub-district vice-president, conducted the negotiations for the miners.

The Ohio County Fuel Co., affiliated with the American Gas & Electric and the West Penn Power companies, has purchased 3,354 acres of coal land in Richland district of Ohio County. The purchase price was \$839,000. The acreage purchased was for the express purpose of insuring a supply of fuel for the Windsor power plant at Beech Bottom for the next half century. At the time the deed covering the sale of the property was filed, a mortgage creating the Union Trust Co. of Pittsburgh as trustee for the issue of \$600,000 of gold serial bonds was filed, the proceeds to be used in completing payment for the tract. The properties purchased are underlain with the Pittsburgh and Wheeling coal veins.

The Western Maryland & Tidewater Ry., constituting an outlet for several thousand acres of coal land south of Grantsville and connecting with the Baltimore & Ohio, has been sold by William E. Ambrose, of Cumberland, and his associates to the Morgantown Coal Corporation, headed by William A. Morgant, which owns 7,000 acres of coal land in Garrett County, Md., and has a number of mines in operation. Mr. Morgant and his associates have not only purchased the railroad, but also the balance of the Jennings interests in Garrett County, including practically the entire town of Jennings. The road will in the future be known as the Casselman Valley R.R.

Suit instituted by the Marine Smokeless Coal Co. against the Norfolk & Western Ry. may involve an interpretation of the Elkins Act, for it is considered possible that it will eventually reach the U. S. Supreme Court. The suit was filed in the Circuit Court of McDowell County to recovering the amount expended, plus interest, in building a spur track up Davy Creek, covering a distance of about a mile and a half. The coal company sets forth the fact that after the spur was completed it was forced to deliver a deed for the spur to the railroad company and that by the terms of the deed the spur became a part of the main line of the railroad company, subject to all the laws and regulations applicable to common carriers and therefore was placed at the service of competing companies who paid no part of the construction cost and who were under no obligation to reimburse to any extent the plaintiff company. It is contended by the coal company that this amounts to a discrimination in law.

WASHINGTON

The Cambridge Coal Co., of Seattle, has incorporated with a capital stock of \$300,000. The incorporators are E. M. Cushman, E. T. Pope and George A. Brooks.

The Beacon Coal Mines Co. has reorganized and hopes to reopen its mines near Seattle. W. J. Muirhead is president and general manager.

The East Fork Coal & Clay Co., of Seattle, has changed its name to the Everett-Fisher Coal Corp. and has increased its capital stock from \$150,000 to \$250,000.

The Sedro-Woolley Coal Co., of Bellingham, has been incorporated with a capital stock of \$40,000 by H. W. Buzzard, M. C. DuVall, Elmer C. Saxon and William Seeger.

A dream for briquetting Washington coal came to an end recently when the equipment of the Centralia Briquetting Co., of Centralia, was sold by the receiver for \$2,560 to the Western Machine Exchange, of Aberdeen, which will dismantle the plant. The briquetting company was organized several years ago by L. A. Kingkinney to manufacture briquets by a process on which Kingkinney claimed to have a patent. The plant never operated on a commercial basis and Kingkinney was made defendant in numerous civil and criminal actions. His death occurred later. It is estimated that Centralians invested about \$40,000 in the company. The sale did not include the building and grounds, which will be turned back to W. A. Davis, administrator of Kingkinney's estate.

Operators in Washington feel that the business of their properties in that state has been saved from practical extinction by the recent decision of the I.C.C. in the Western rate case. The commission made slight increases in coal freight rates between Utah and the Pacific coast instead of the reductions for which Utah prayed. Into Seattle rates on lump, nut and slack were increased 26c. a ton, and into Portland, Ore., for instance, the increases are 15c. on lump, 21c. on nut and 30c. on slack. Washington men contend that if Utah-to-the-coast reductions had been made there would have been little opportunity left for Washington to sell its coal and that sooner or later Washington mines would practically be driven out of business. This would give British Columbia coal a further chance to come down the coast, Washington contended before the commission.

WISCONSIN

The Chicago & North-Western Ry. is building a \$30,000 coal hopper at the foot of Corcoran Avenue in Milwaukee.

A number of coal docks at Superior were damaged by a recent storm. The docks of the Clarkson Coal Co. and the Pittsburgh Coal Co. fared the worst. Three bridges of Dock No. 7, of the Pittsburgh company were badly twisted. The damage caused some delay in unloading vessels.

The Milwaukee Electric Railway & Light Co. has acquired the barge A. C. Tuxbury, a Great Lakes lumber-carrying vessel, and will use her in transferring coal from the docks to power houses on Milwaukee River. About 350,000 tons of coal is handled in this way during the course of a year.

Among the many resolutions forwarded by the Legislature of Wisconsin to Vice-President Coolidge for presentation to U. S. Senate was one embodying a request that legislation be enacted by Congress requiring consignments of coal to be accompanied by statements showing the quality of the product.

WYOMING

A lease on 1,000 acres of coal land near the Crosby mines at Lander was bought at auction at the Lander land office July 5 by the Big Horn Collieries Co. At least 20,000 tons a year must be extracted beginning the third year and at least \$50,000 must be invested in developing the field.

WASHINGTON, D. C.

The Navy Department will receive bids until 10 a. m., July 31, for supplying and delivering 500 gross tons of bituminous mine-run coal to the Naval Experimental and Research Laboratory, Bellevue, D. C.

The Civil Service Commission has announced the opening of examinations for valuation engineers and associate engineers. It is the commission's desire to build up eligible lists from which the Treasury Department can choose engineers capable of examining coal properties for taxation purposes. The salaries range from \$3,000 to \$3,600 for associate engineers and from \$3,600 to \$4,800 for valuation engineers. The explanatory papers can be obtained on application to the Civil Service Commission at Washington.

CANADA

The Dominion Government by order-in-council has continued the suspension of royalties on coals mined in Yukon territory for an additional period of five years.

Eastern Canada Collieries, Ltd., has been granted a Dominion charter, with headquarters at Montreal. The authorized capital is \$50,000 and the company is empowered to carry on business as operators and wholesalers.

The Norwegian steamship O. A. Knudsen, 3,352 tons, and the French boat Banba, 492 tons, both loaded with coal, were lost on the shores of St. Mary's Bay, N. F., on July 1. The crews of both vessels, which are reported to be total wrecks, landed safely.

The city of Toronto is buying bituminous coal for 90 per cent of its school fuel. Last winter it was obliged to do so and now that coal is preferred, at \$7.53 a ton, in place of \$15.50 for anthracite. The price paid for bituminous last winter was \$9.80. Coke used cost last winter from \$14 to \$17.

Railway, government and coal men will attend the conferences to be held at Winnipeg, Manitoba, regarding freight rates on Alberta coal to Eastern Canadian points. The meeting is expected to take place in a few weeks. The object is to obtain a rate on Alberta coal that will permit it to be shipped into Ontario and sold at a price that will assure successful competition with imported coals.

Reports showing a satisfactory year's business were presented at the annual meeting in Fort Erie of the Penn Canadian Fuel Co., with head office in Toronto. Among those present at the meeting were: L. W. McClellan, Toronto; W. R. Crothers, of Pittsburgh; F. H. Hoag, C. W. Moss, C. L. Couch and C. W. Smith, of Buffalo.

The Canadian National Ry. system is making a test of Alberta coal, a carload of coal from Drumheller having been brought to Stratford, Ont., arriving in good condition. It has been placed in storage under ordinary cellar conditions and will be examined in November to see how it stands storage. In case the result proves satisfactory the only factor of the problem remaining to be settled is that of price which will depend mainly on freight charges.

The Engineering Institute of Canada and the Canadian Institute of Mining and Metallurgy have both passed resolutions urging the fuel committee of the Canadian Senate and the House of Commons to consider the importance of appointing and providing funds for a committee of coal, transportation and equipment engineering experts to act in consultation with the engineering departments of the transcontinental railways to determine both scientifically and experimentally the greatest extent to which the cost of the transportation of coal from Alberta to Ontario can be reduced.

A conference of Canadian National and Canadian Pacific railway officials, coal operators, and representatives of the provincial government, was held at Edmonton, Alta., July 16, following which it was announced that a ton rate of \$6 or \$6.50 for the shipment of Alberta coal to Ontario was impossible. Premier Greenfield stated, however, that an arrangement had been effected whereby shipment would be made within the next few weeks of 4,000 tons, at a rate to be definitely decided later, which would be such as would allow Alberta domestic coal to reach Ontario in car lots at a competitive price. The rate at which this shipment would be made would be merely experimental. Jesse Gonge, representing the operators, said that furnace new coal could be sold at the mines for \$4.50 per ton or over. Allowing \$2.50 for dealers' profits, sacking and handling this, if the freight charges were reduced to \$6 to \$6.50 per ton, as against the present \$9 rate, would bring the retail price to \$13 or \$13.50 in competition with a present retail price for anthracite of \$15.50.

William Sloan, minister of mines for British Columbia, has been engaged in making a tour of the underground workings of the coal mines of Vancouver Island. He has been accompanied by the new chief inspector of mines, George Wilkinson. Mr. Sloan found conditions as to the safety of the miners very satisfactory. Some of the workings places in No. 5 mine, South Wellington, and the Reserve mine, near Nanaimo, still are a source of trouble to the miners because of the sulphurous fumes given off by the coal. To this condition the minister paid special attention and he

has decided to call in an eminent bacteriologist and pathologist to see what can be done to eliminate, or at least alleviate, the trouble. Dr. R. H. Mullin, a recognized authority on health work and industrial hygiene and head of the bacteriological and pathological department of the University of British Columbia, is to be asked to make this investigation.

Exaggerated statements have obtained circulation as to contracts entered into for a supply of Mexican coal for Canada, the amount contracted for having been placed as high as ten million tons. It is now stated that through arrangements made by Noel C. Wilde, Commercial Commissioner for Canada in Mexico, 600,000 tons of coal will be shipped from that country to Canada during the coming seasons. Most of the coal is located in the district around Sabinas, in the State of Coahuila. Canadian boats will be used for transportation from the port of Tampico. The price is stated at \$9 per ton f.o.b. Tampico.

With twenty-two hundred tons of Welsh anthracite coal on board, the Eastern Steamship Co.'s vessel "Judge Hart" has arrived in Toronto and is at the Century Coal Co.'s docks. It is the first of a series of shipments that are to come direct from Wales to Toronto.

According to a wire received by the Dominion Superintendent of Penitentiaries from an Edmonton coal company, he has been given a quotation of \$12.80, delivered in the freight yards at Ottawa. This is almost \$4 lower than the rail price of Pennsylvania anthracite.

Shipments of coal from the Nova Scotia collieries during June have been very heavy, with all collieries working full time, the output running from 22,000 to 24,000 tons per day. No. 7 colliery, Sydney Mines, which was idle all winter, is again producing, and No. 15 colliery, which was closed for several years, has been reopened and is being put in condition for operation. The Dominion Coal Co. is making a thorough test of coal mining machines, using different machines in different collieries.

MEXICO

A contract has just been awarded the Wilputte Coke Oven Corporation, New York, for the installation of forty coke ovens, with a complete byproduct and benzol plant at Rosita, in the State of Coahuila. Besides the oven plant, the plans include the installation of an up-to-date power house, a new shaft and hoist and a coal washer which has been designed under the direction of G. P. Bartholomew, general manager of the coal-mining department of the company.

Association Activities

Clarksburg Coal Club

That the outcome of negotiations between anthracite operators and miners and the possible bearing it may have on the bituminous situation is uppermost in the minds of bituminous operators was reflected in the general trend of discussion at recent meetings of the Clarksburg Coal Club, of Clarksburg, W. Va. T. J. Ryan, of the Hutchinson Coal Co., of Fairmont, discussed briefly what might be expected at a recent meeting of the club. J. M. McDonald, of Cincinnati, discussed recent revisions of freight rates on coal from Ohio and Kentucky, pointing out that already West Virginia operators feel the effects of the differential between West Virginia and Ohio sufficient to give Ohio operators a slight advantage. The new ruling, it was stated, enhances the advantage already held.

Obituary

George Hirsch, 67, owner and manager of the George Hirsch Coal Co., Milwaukee, Wis., died suddenly on Wednesday, June 27, 1923. He was one of the oldest jobbers and retailers of coal in Milwaukee.

Fred J. Cropsey, 56, for many years a coal manager in St. Paul, is dead. He was manager for the Carnegie Coal & Dock Co. for many years. He had been a resident of St. Paul for 30 years. A widow and three children survive him.

Publications Received

Mineral Production of Canada for the calendar year 1921. Dominion Bureau of Statistics, Mining, Metallurgical and Chemical Branch, Ottawa, Canada. Pp. 233; 6x9 in.; tables.

Mineral Resources of Alberta, Canada, 1922, Part I, covering Saunders Creek and Nordegg Coal Basins, by John A. Allan and Ralph L. Rutherford, University of Alberta, Edmonton, Alberta, Canada. Pp. 66; 7x10 in.; illustrated. Report on the geology of these basins, with geological map showing structure and areal distribution of the formations including the coal measures.

Progress of Investigations on Liquid-Oxygen Explosives, by S. P. Howell, J. W. Paul and J. L. Sherrick, Bureau of Mines, Washington, D. C. Technical paper 294. Pp. 91; 6x9 in.; illustrated; tables.

Manufactured Gas in the Home, by Samuel S. Wyer, associate in mineral technology, U. S. National Museum, Smithsonian Institution, Washington, D. C. Bulletin 102, Part 8. Pp. 24; 6x9 in.; illustrated. Insert in the front part of the bulletin shows model of how coal is transmuted into gas and delivered to the home.

Trade Literature

Type K Stoker. Combustion Engineering Corporation, Broad St., New York City. K-1. Four-page folder. This stoker under-feeds the coal, and dump grates may be installed in place of shaking grates where the burning characteristics of the coal used make it advisable. The outcome of a test at a plant operating three 150-hp. B. & W. boilers is given.

Catalog of Electrical Supplies, 1923-1924. Westinghouse Electric & Mfg. Co., East Pittsburgh, Pa. Pp. 1302; 8x11 in.; illustrated. The catalog is indexed according to subjects and to sections; it also has a style number and thumb index. A feature not included in previous catalogs has been added to the introductory section under the title "How this catalogue serves," wherein is listed apparatus of particular interest to mines, etc.

Traffic News

That the Monongahela Ry. will be able to move a much larger tonnage from the Monongalia field of West Virginia within a few months was the statement recently made by Colonel H. C. Nutt, president of the road. Discussing plans for additional coal-handling facilities, Col. Nutt said: "We expect to spend thousands of dollars in the Madsville section during the summer and hope to complete the work within three or four months. When the work is completed travel along the highway paralleling the railroad will be much improved and district coal operators will find greater facilities for moving coal." He said that a steam shovel was in operation below Madsville preparing for the double trackage to Lock 9, adding that the improvements in the Madsville yards proper would be started within a short time.

Rates on coal from Standardville and other Utah points to Salt Lake City, held to have been in violation of the long and short-haul provision of the Interstate Commerce Act during the period of federal control, are not in violation of the law, in the opinion of J. O. Cassidy, an Interstate Commerce Commission examiner. In a tentative report to the commission he recommends that the complaint be dismissed. The complaint was brought by two corporations engaged in the retailing of coal and by a manufacturer of gas and certain byproducts of coal.

The Chicago & Northwestern R.R., was granted authority by the Interstate Commerce Commission July 20 to assume obligation and liability in respect to \$4,755,000 of 7 per cent equipment trust certificates. The certificates are to be sold at not less than 96½ per cent of par and the proceeds used to procure additional equipment.

Appointment of Charles F. Wolcott, formerly connected with the Pennsylvania R.R., to be district manager of the Car Service Division of the American Railway Association, in Pittsburgh, Pa., has been

announced by the Car Service Division. He assumed his new duties on July 15. The territory making up the Pittsburgh district includes the western half of Pennsylvania, western New York, northwestern Maryland, northern West Virginia and Ohio east of a line drawn from Parkersburg, W. Va., to Mansfield, Ohio, thence to Buffalo, N. Y. The district, however, does not include Buffalo, Niagara Falls or Suspension Bridge terminals.

The Lehigh Valley R.R. reports anthracite loadings for the first half of July amounting to 504,428 tons, the largest since 1920. Last year at this time the movement of coal was at a standstill because of the miners' strike. Loadings for June stood at 1,224,068 tons and this level is expected to be reached during July.

Hearing in Valuation Docket No. 235, in re tentative valuation of the properties of the Virginian Ry. Co. and the Virginian Terminal Ry. Co., assigned for Sept. 5 at Washington, D. C. before Examiner Pattison, has been cancelled and the case re-assigned for Oct. 8, 10 a.m.; same place and examiner.

Clarence W. Huntington, president of the Virginian Ry., in his annual report of the operations of that railroad for the year ended Dec. 31, 1922, says that the coal strike of last year affected the mining operations on that road at Eccles and west thereof, but the decrease in tonnage was more than offset by increased production in the other mines along the company's lines. At the close of the year there were 113 coal mines, not including wagon mines, in operation on the main line, branches and connecting lines in Virginia and West Virginia, of which eight began shipping during the year, and three additional mines were under way. Four of the above mines were temporarily closed during the year on account of strike conditions. President Huntington says the bulkheads for the new pier being erected at Sewalls Point were practically completed at the close of the year. There was carried over the road during the year 7,397,025 tons of miscellaneous freight as compared with 6,376,648 tons in 1921. Revenue from coal and coke freight was \$14,875,509.10 as compared with \$13,743,394.58 the previous year. Net operating revenue for the year was \$6,570,052.36 as compared with \$5,618,628.97 in 1921, an increase of \$951,423.39.

A total of 8,646 new freight cars were placed in service from June 15 to July 1 by the railroads of the country, according to the Car Service Division of the American Railway Association. This made a total of 79,240 new freight cars placed in service from Jan. 1 to July 1. The railroads also placed in service during the last half of June 158 new locomotives, making in all 1,998 put in service during the first six months this year. Of the 8,646 new cars installed from June 15 to July 1, 2,987 were coal cars. The railroads on July 1 also had 96,855 new freight cars on order. Of the number on order, 38,736 are coal cars. In addition, the railroads also had on order on July 1, 1,902 new locomotives.

Freight rates on coal from Ward, W. Va., to Ironton, Ohio, have been found to be unreasonable by the Interstate Commerce Commission. In a decision rendered in the case of the Dayton Malleable Iron Co. versus the Kanawha & Michigan Ry., the commission holds that for the future the rate will be unreasonable to the extent that it exceeds \$2.14 per ton.

In connection with the \$37,000,000 improvement program planned by the Chesapeake & Ohio Ry., contracts have already been awarded to cover approximately 70 per cent of the \$4,000,000 to be expended on improvements in and near Huntington. One of the first improvements to be undertaken is the double tracking of the Big Sandy division at a cost of approximately \$1,500,000, plans for which are already under way. Additional tracks and sidings are to be constructed on the main line between Handley and Russell. Additional yards, sidings and engine terminal facilities are to be provided in the Coal River district and \$654,100 is to be expended on the Logan Division for additional yards and sidings. Between Handley and Russell \$848,000 will be expended. Improvements to be made in the Coal River district will approximate \$514,000. Improvements to be made to the Guyan Valley division are expected to increase materially the facilities of the company for handling a larger volume of coal from the Logan fields.

Products of mines to the extent of 149,197,528 tons were carried by the Class 1 railroads of the country during the first quarter of the current calendar year. This represents an increase of 23.41 per cent

over the first quarter of 1922. During the first quarter of 1923 the products of mines contributed 53 per cent of the entire tonnage of original freight carried by the railroads. The tonnage contributed to the railroads by the mines of the country during the first quarter of 1923 is subdivided as follows:

	Tons
Anthracite	22,281,156
Bituminous coal	92,106,997
Coke	7,167,182
Iron ore	1,842,549
Other ores and concentrates....	2,504,987
Base bullion and matte.....	175,446
Clay, gravel, sand and stone....	18,997,997
Crude petroleum	1,830,724
Asphalt	322,375
Salt	743,457
Other products of mines.....	1,224,658

Total 149,197,528

Freight traffic in May was 39,597,582,000 net ton miles, the heaviest for that month in the history of the railroads, according to a report by the Bureau of Railway Economics. This was an increase of 2.7 per cent over the same month in 1917, when the previous record for that month was made. The daily average movement per freight car in May was 28.6 miles. Except in May, 1917, when an average of 29 miles was attained, this has never excelled in any month before and only once equaled, that being in the autumn of 1920. The average of 28.6 miles was an increase of three-fifths of one mile over the average for April. The average load per car in May was 28 tons, the highest for any May since 1917, when the compilation of these statistics began except for May, 1920, when the average was 28.2. The average for May this year was an increase of two-fifths of a ton over that for April. The program adopted by the railroads calls for a daily average movement per car of 30 miles and for the loading of all freight cars to maximum capacity in an effort to bring the average loading to 30 tons per car for the entire country.

Coming Meetings

The tenth annual Tennessee First-Aid Contest and Miners' Field Day will be held at Knoxville, Tenn., Aug. 4, in the Knox County Court Yard, under the auspices of the Tennessee coal operators, state mine inspectors and the U. S. Bureau of Mines, R. E. Howe, secretary of the Southern Appalachian Coal Operators Association, secretary-treasurer. J. M. Webb, of the U. S. Bureau of Mines, is instructing the first-aid teams.

The American Institute of Mining and Metallurgical Engineers will hold its annual meeting in Canada. The meeting will start Aug. 20 at Toronto and end Aug. 30 at Montreal. Secretary F. F. Sharpless, 29 West 39th Street, New York City.

Rocky Mountain Coal Mining Institute will hold its summer meeting Aug. 27 to 29 at Salt Lake City, Utah, in conjunction with the International Safety and First-Aid Meet. Secretary, Benedict Shubart, Denver, Colo.

New York State Coal Merchants' Association will hold its annual convention on Sept. 10-12 at Sacandaga Park, N. Y. Executive secretary, G. W. F. Woodside, 250 Arkay Building, Albany, N. Y.

Oklahoma Coal Operators' Association will hold its annual meeting Sept. 13 at McAlester, Okla. Secretary, A. C. Casey, McAlester, Okla.

The American Mining Congress will hold its twenty-sixth annual convention in conjunction with the National Exposition of Mines and Mining Equipment, Sept. 24-29, at the Milwaukee Auditorium, Milwaukee, Wis. Secretary, J. F. Callbreath, Washington, D. C.

National Safety Council will hold its twelfth annual safety convention at the Buffalo Statler Hotel, Buffalo, N. Y., Oct. 1-5. Managing director and secretary, W. H. Cameron, 168 No. Michigan Ave., Chicago, Ill.

The West Virginia-Kentucky Association of Mine, Mechanical and Electrical Engineers will hold its annual meeting Oct. 19-20 at Huntington, W. Va. Secretary-treasurer, Herbert Smith, Robson-Prichard Bldg., Huntington, W. Va.

Coal Mining Institute of America will hold its annual meeting Dec. 19, 20 and 21 at Pittsburgh, Pa. Secretary, H. D. Mason, Jr., Chamber of Commerce Building, Pittsburgh, Pa.

COAL AGE

The Only National Paper Devoted to Coal Mining and Coal Marketing

C. E. LESHER, *Editor*

Volume 24

NEW YORK, AUG. 2, 1923

Number 5

The Check Off as an Issue

IT WOULD have been surprising if the bituminous coal operators had left unchallenged the assertion of John L. Lewis to the anthracite operators that the "check off" had been working for years in the soft-coal fields to the mutual satisfaction of both parties. The statement issued last Saturday by the National Coal Association covers the situation. The check off, however it may have come into being, and whatever its virtues originally as a source of strength to a growing organization of mine workers seeking to stabilize the industry in which they worked, has of late years fallen into disrepute.

The method by which the union forces allegiance and payments of assessments and dues, unique as it is in industrial relations, has not itself been held to be illegal, at least by high courts. But the use to which it is put has been vigorously condemned, and it is a practice now closely bound into the relations with the United Mine Workers and one of which a great many, if not all the organized soft-coal operators would heartily like to be purged. To hold as an argument, as have the committee for the anthracite workers in the recently disrupted negotiations at Atlantic City, that for the hard-coal operators to concede the check off would be to enable the union to better hold the men in line, prevent petty strikes and otherwise benefit the industry, in the face of the record of local strikes and disrupting practices in the oldest organized soft-coal fields of the country, where the check off has been in effect for a quarter of a century, is to strain one's credulity.

Since it is the issue of the check off that is threatening to shut off anthracite production on Sept. 1, the public will seek to learn what the Coal Commission has to say on that point. It will look in vain, however, in the commission's anthracite report of last month for word about the check off. It is not mentioned. There are eight recommendations covering the matter of preserving peace in the hard-coal fields, of preventing and forestalling friction and promoting harmony. That would seem to be its answer to the miners, who say that without the check off they cannot keep the men under control.

It were well to recognize the check off for what it is—a means of financing the United Mine Workers. If they hold above all other demands the need for a forced draft of funds from the men, if they place, as they seem to have done, the demand for the check off above that for corrections in working conditions and higher wage rates, then they are saying that Indianapolis rather than the mine worker requires more money. It is quite generally known that dues are difficult to collect when the payment is voluntary. There are two ways to collect union dues—one to enlist the man's enthusiasm and support so that the money is gladly

given in support of the cause; the other to force the operators to collect it, even if in the process the country is deprived of coal at the beginning of winter.

It is all very well to say that the miners execute individual assignments permitting the company to subtract the moneys from their pay. The practical effect, as every soft-coal operator who collects the check off knows, is to force the men to the agreement. The union furnishes the duress. There are no exceptions; the result is the "full union recognition" desired by Mr. Lewis, and every pay check gives up its toll to the union treasury, in a way and to a degree that does not now obtain in the hard-coal region.

Quid Pro Quo

SECRETARY of the Interior Work will be greeted on his return from Alaska with the compliments of the engineers of the country. He may be somewhat surprised to learn that his summary dismissal of A. P. Davis from the directorship of the Reclamation Service is considered by the profession in which Mr. Davis stands so high to be nothing short of an endeavor to obtain a partisan political advantage. That is to say, the new Secretary of the Interior, who has established national fame for his successful conduct of an asylum for mental diseases, is credited with playing the political spoilsman with the Reclamation Service. The federal government has a net investment of \$132,000,000 in reclamation projects, \$8,000,000 is invested annually in new projects and there is an annual turnover of some \$4,000,000 in the maintenance fund. No less than 100,000 voters in the West, where votes are few, are directly interested in these projects.

Arthur P. Davis was fired after many years of valuable work in building up and protecting this vast and widespread enterprise of our government. He was fired because he would not resign. It is understood that he steadfastly stood in the path of those in the administration who would forget the debts—for votes—of those who owed money on their water rights.

Ex-Governor Davis of Idaho, who now takes administrative charge of the Reclamation Service, is admittedly a practical professional politician—one who, it is reported wanted the secretaryship now occupied by Mr. Work.

Secretary Work's explanation is an insult to the engineering profession. He wants a business man at the head of this bureau! The man he selected succeeded in the grocery business, but his subsequent banking experience was not so successful!

In the Interior Department, which Mr. Work now heads, are other technical bureaus—the Geological Survey and Bureau of Mines in particular. Will he seek business heads for these as well, or are there not sufficient votes appended to these activities?

Selfish Unselfishness

IF HERBERT HOOVER, Secretary of Commerce, were called upon to compress into two words the idea behind "good" trade associations, he might call it selfish unselfishness. In the book on associations which his department recently issued Mr. Hoover makes another effort to drill home the convincing thought that business can be of greatest service to itself by being of greatest service to the public. Accurate compilation and distribution of business statistics on coal, for instance, are essential if the people of this country ever are to understand coal and get the correct mental attitude toward the industry. In no better way can "coal baronism" be expunged from the nation's mind.

No other agency can do it so well as the trade association, Mr. Hoover believes. So the association is the industry's best weapon for defence. Therein lies its selfishness. But the association must be sound in principle and practice from core to surface. The only way to make its statistics constructive is to conduct it "alike for the benefit of producer and consumer." Therein lies its unselfishness.

Such associations we must have, Mr. Hoover thinks, because every industry needs adequate statistical services both for the direction of those within the industry and for the information and understanding of those outside it. There is a point to Mr. Hoover's sentence: "Whether these services are to be maintained by the government or by trade associations, they must be maintained if we are to have an orderly economic life." It is useless to try to decide whether Mr. Hoover means this as a threat. It is not his habit idly to toss threats about. He does habitually devote a master intelligence, though, to problems confronting all American business, and it is evident that he is going to do everything he can to see that this country has "an orderly economic life."

Brain and Brawn

EDMUND HENRIQUES, coal miner at the Gates mine of the H. C. Frick Coke Co., has chosen to sell his brawn rather than his brain, though apparently he does not lack the latter. During the World War Henriques served in the British Royal Air Service as a flyer. For bravery and daring, and for skill doubtless also—bear that duly in mind—he was cited by his superiors.

He is in America digging coal for the public, a job "affected with public interest," and he seems to be doing quite well. The other day he purchased an airplane in New York, rose in the air and flew in five hours to Gates. In the evening after his day's work is done he is said to disport himself with nose dives, tail spins and the like.

The question naturally arises, Is he worthy of the earnings of \$300 to \$350 a month which he is said to be receiving? Is he entitled to have a wage that will enable him to buy and operate an airplane? Is the miner in West Virginia, of whom we have heard, whose wife meets him every night in a Packard getting too big a wage? We do not know. We might if wages in coal mining were left entirely to supply and demand.

The time may come in America when brawn may compete on even terms with brain, especially with the more mediocre kinds of the latter. Certain it is that some people believe that the time already has come. Some say brawn is in the ascendant and prove it by

alleging that those who merely think and plan and do not exercise their muscle obtain less for their work than those who when they exercise their brains do so only in the direction of their own physical efforts.

Unrestricted competition might settle that question, but we do not find it operative any more, for the payment for labor in union mines is kept at a high level by combinations and that at non-union mines may be boosted for all we know by the fear of such conspiracies, whereas brain labor is not thus sustained. Perhaps that is why mine foremen, surveyors, mine clerks, and even superintendents often fail to get wages equal to those paid physical laborers. But then again that may not be the reason. We do not know.

Still it cannot be denied that men who do not disdain hard and dirty labor and who dispense with the dignity of the office man and official yearly are gaining on the lower grades of brain workers. It is getting more and more customary for men to seek the softer jobs, and the market is accordingly overstocked. The sons of miners hunt less arduous occupations than their parents, as more desirable, even if less remunerative.

Say what we will, our ancestors did not find personal toil either derogatory or displeasing. They were inured to hard labor and respected those who were willing as they were to perform it. Because the brain worker has set himself apart does not by that fact entitle him to bigger pay. Direction of the services of others is not necessarily more valuable than the performance of the services themselves. So we cannot feel assured that Henriques has not a right to his evening spin or the man in West Virginia to come to, and leave, his work at the wheel of his Packard.

But at the same time we cannot be sure whether this is so till all men come into an open market to find the true value of their services and learn by unrestricted competition how greatly the country needs their particular class of effort, and how many are able and willing to perform it.

With common-school education what it is, with higher education so cheap, everyone can perform certain of the labors which we class as brainwork jobs, but since man first rose above the animals there have been occupations that needed veritable genius. The men performing such jobs always will be paid more than those who employ themselves at work which demands many foot-pounds of energy and but little skill for its accomplishment.

Meantime, Henriques, so long as your flights leave you with a whole skin, you will as a flyer and a worker typify the new world into which we are about to enter and perhaps have already attained.

SPEED WOULD SETTLE MANY A COAL DISPUTE. But how can a dispute over the quality of a car of coal be settled quickly if the matter goes to a court of law? The car cannot stand on a siding for ninety days rolling up demurrage while some court gets around to it on a crowded calendar. But one or more coal men could hasten out and see that car of coal on a day's notice, or less. Right there is a strong argument for writing an arbitration clause into every coal contract. With such speed possible, an improper or unfair complaint against a shipment of coal would be strictly out of luck. Also, an unprincipled shipper would have a hard time palming off fireproof fuel or anything else that did not appear to be up to the specifications. There would be more justice in coal trading.

Surface Plant, Gallup American Mine, Navajo No. 5

Gallup American Coal Co. Displaces Four Long Slopes With One Ultra-Modern 5,000-Ton Shaft Mine*

Navajo No. 5 Is Sunk in Broad New Mexican Tract to Increase Economy and Output—Main Shaft Equipped with Skip—Other Shaft with Cage, so That Two Seams Can Be Served

BY H. B. COOLEY†

INTEREST has centered lately upon the property of the Gallup American Coal Co., near Gallup, N. M., where a pair of deep shafts tapping a low point of a large coal acreage are displacing four slopes the length of which has reached the "economic limit." New, big-scale underground development, a skip hoist and a noteworthy surface plant are combining to consolidate the scattered slope units into one economical and thoroughly modern 5,000-ton mine—Navajo No. 5. Three coal camps also are being merged into one mining town.

The Gallup American Coal Co. is owned by three of the large copper companies of the Southwest, and the output from the mines of this company insures to its owners and other mining and metallurgical plants in Arizona and New Mexico an adequate supply of fine coal for their power plants and smelters. One-inch screens ordinarily are used to separate the commercial from the "company" coal. Everything that passes over these screens is sold by the coal company through commercial channels.

The Santa Fé railroad uses 1x4-in. egg coal for several divisions of its Southwestern territory, and this size is demanded by some of the mining companies. Domestic grades, especially "Gallup lump," are in large demand throughout the Southwest. Gallup coal is sold as far north as Albuquerque, N. M., east through the Pecos Valley to Amarillo, Texas, south to El Paso, in the same state, and west to Los Angeles and San Francisco.

The Gallup coal field, on the main transcontinental line of the Santa Fé railroad, is the most promising source of fuel throughout a vast territory in the south-

western portion of the United States. The location and extent of this coal field are shown by Fig. 1, from which it can be seen that the Gallup American properties are in the heart of the Gallup field, that company holding extensive coal and surface rights. It is expected eventually to develop 3,000 acres of coal property, all containing two workable seams, from one centrally located mining operation.

Thus far practically all of the developments in this territory have been by means of slopes. Coal has been mined in that way in this field for over 35 years, the most extensive work having been done by the Victor American Fuel Co. That firm had four operations working before the war, and on July 1, 1917, these plants together with all coal and surface rights were acquired by the Gallup American Coal Co.

The mining plants which the present owners have continued to work since 1917 are known as the Weaver Slope, Navajo Slopes Nos. 1 and 2, and the Heaton Slope. Their location with respect to each other and to the new mining operations are shown on the general map (Fig. 2).

As can be seen by referring to this map the slope operations have all been carried to what might be called the economic limit. Foreseeing this fact the present owners several years ago began prospecting for a more suitable location for further developments, and drilling was started to establish the extent and character of the coal underlying their undeveloped property.

The general map—Fig. 2—shows how thoroughly this territory was drilled. After a study of the data obtained from these drillholes it was decided that a shaft should be sunk in what had been proved to be the "basin" of the coal area.

In the meantime several conditions at the old plants began to make the need for this new development more apparent. First, the coal available from the Heaton

*This is the first of three articles on Navajo No. 5 mine. The second article, covering the underground workings and bottom plan, the skip hoist, the auxiliary hoist and the tippie, will appear soon. The third will cover power plant, water supply and other interesting features.

†General superintendent, Allen & Garcia Co., Chicago, Ill.

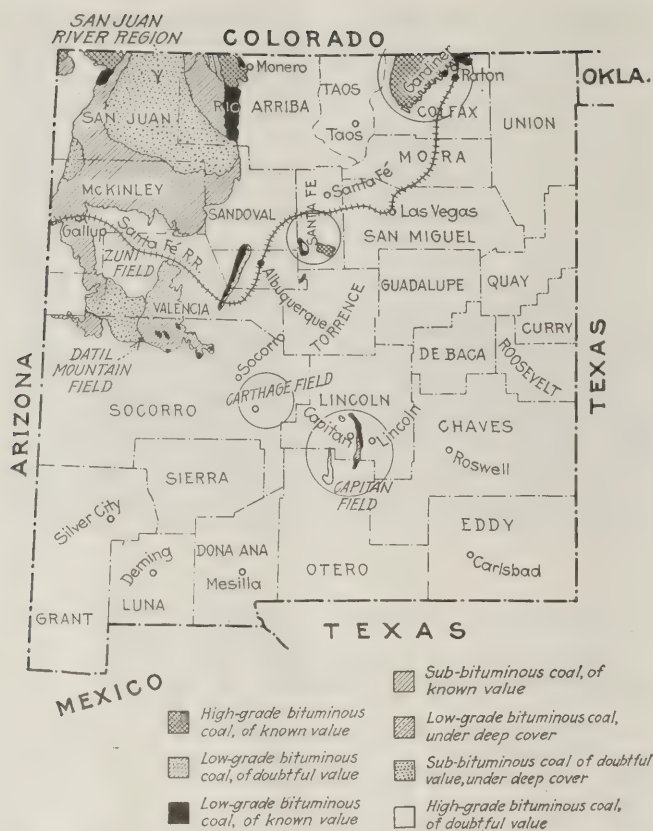

FIG. 1—COAL-RESOURCE MAP OF NEW MEXICO SHOWING LOCATION OF GALLUP FIELD

Gallup lies in the San Juan River region. The coal is sub-bituminous; that at Raton is bituminous. In the Cerillos field some anthracite coal is found in connection with an intrusion of diorite. The nearness of the Gallup field to Arizona is deceptive, the connection with the copper fields unfortunately being somewhat indirect.

Slope was nearing exhaustion. Mining costs at this operation were not excessive, but it was impossible to obtain additional coal rights adjacent to the mine workings. Second, with the increased length of the Weaver and Navajo slopes, the cost of the coal from those mines was rising rapidly, not only by reason of the longer haul but also because the fires in the coal measures above the workable seam, which were difficult to control, rapidly increased the costs of maintaining the slopes, for the heavy ground could be restrained by timbering only with difficulty. Third, the demand for coal began to exceed the maximum production of these properties under the unfavorable conditions with which they then were confronted.

With these factors facing them the owners on July 1, 1920, decided to build a complete new mining plant and the Allen & Garcia Co., Chicago, were selected as engineers and directed to prepare plans for the entire operation. Previous to this time the data obtained from the diamond drillholes had been thoroughly correlated and an accurate contour map of the company property completed.

With this information as a guide, preliminary top and bottom plans were prepared and an effort was made to fit the two sets of plans together in such manner as to obtain the best possible arrangement for both. Underground conditions seemed to favor a main haulageway running approximately north and south. Overground conditions favored a track layout at an angle from that line. The result was that the two main axes of the entire layout lacked 17 deg. of being at right angles with each other. Although at first this feature seemed somewhat of a hardship, it proved

to have several advantages in the detailed development of the plans.

Following the adoption of the general scheme for underground and surface layout, tentative shaft locations were fixed and diamond drilling was started adjacent to these locations.

While this work was under way more detailed plans for the underground haulageways were developed and an accurate surface layout was prepared. All the general features of the entire operation affecting the size of the shafts were decided upon as quickly as possible and the shaft plans were completed and material was on the ground ready to start sinking by the time the drillholes at the shafts were finished. The actual shaft sinking was started Sept. 1, 1920. With this under way plenty of time was available for the completion of detailed plans for the rest of the work.

The determination of the proper size and arrangement for the two shafts involved the consideration of many features. The dimensions for a shaft of this depth should be kept as small as possible without undue limitations being placed on the hoisting capacity or on operating convenience and economy.

To warrant a money investment of the size required to develop this property an ultimate capacity of 5,000 tons per day upward must be anticipated.

If self-dumping cages are to be used for getting this output the hoist cycle must necessarily be fixed by the mine-car capacity. With a coal seam the thickness of which seldom exceeds 5 ft. 6 in., a mine car holding more than three tons is impractical, and thus the coal hoisted per trip with a single-deck cage is limited to that quantity. To get a capacity of 5,000 tons per day,

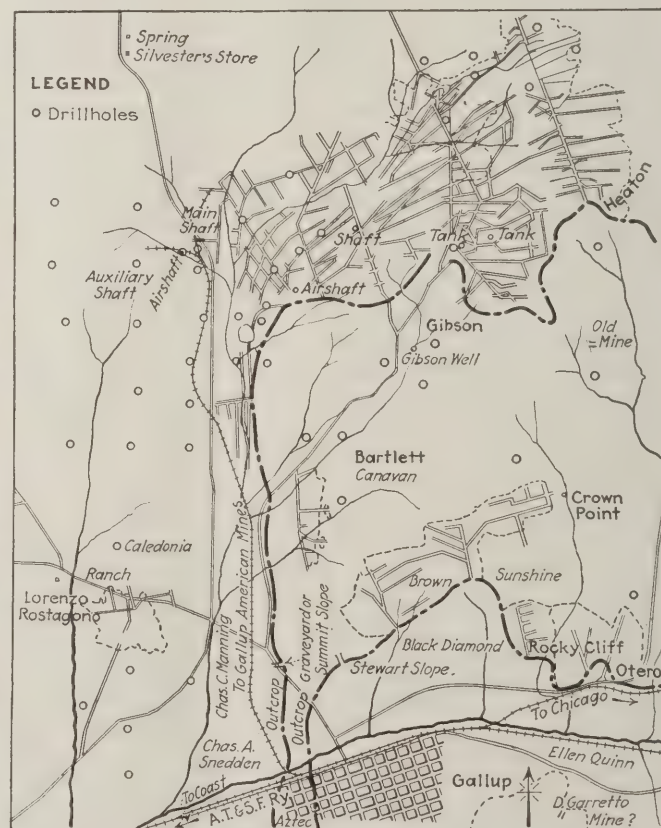

FIG. 2—GALLUP AND ITS NEARBY COAL WORKINGS

The coal fields around Gallup are no longer of unproved value. The network of headings in two of the seams is evidence of that fact. However, the Gallup American Coal Co. has most diligently and methodically proved its property as to coal depth and coal thickness by riddling the proposed seat of operation with drillholes, numbers of which may be noted in this illustration.

hoisting three tons at a time, is manifestly impossible, especially when, as in this case, the total lift exceeds 850 ft.

To use double-deck cages involves many difficulties, such as an expensive car-handling arrangement at the shaft bottom and a breakage of coal in dumping at the top. It was necessary to avoid such breakage in the case of Navajo No. 5. Tandem-deck cages, hoisting two cars simultaneously, were considered, but the idea was abandoned on account of the necessarily tremendous increase in size and cost of the shaft.

The use of skips for hoisting presents a solution for all these difficulties and has many other advantages over all other methods hitherto devised for handling large coal capacities through a single shaft. In consequence, decision was made in favor of the use of skips at the main shaft.

The arrangement at the auxiliary or air shaft was next considered. As has been mentioned, there are two workable seams available throughout most of the area adjacent to the site of the shafts. For the working of the second seam the most feasible plan seemed to be to put a cage hoist in this shaft.

Most modern mines are provided with an independent hoistway of some kind for lowering men and material into the mine. This problem has become more acute at the large-capacity operations where the number of men in the mine often reaches 800 or 1,000 per shift. As from 10 to 20 per cent of the material hoisted at

Gallup is rock, its disposal also presented a serious problem. These considerations all seemed to dictate the installation of cages at the auxiliary shaft with an air compartment for ventilation.

The type of shaft lining to be used was not fully determined even after the diamond-drill cores were available, and it was not until the shaft had been carried to considerable depths that a reinforced-concrete lining was selected. The drillhole logs show nothing to indicate difficulties in sinking, but it was only by skillful work that the heavy ground was held until the concrete lining could be placed.

All the officials in charge of the sinking operation were men experienced in metal-mine shaftwork, and most of the sinkers were Arizona "hard-rock" men of the type notorious not alone for the speed with which they can "punch down a hole" but also for some other stalwart abilities.

The main, or skip-hoisting, shaft is 785 ft. deep from the landing at the surface to the top of the rail in the haulage entries underground with an additional 43 ft. below this point to the bottom, for the skip lands its timbers in the sump. The inside dimensions are 9 ft. x 20 ft. 7½ in., the shaft having three compartments separated by two rows of buntons.

Two of these compartments are used for the skipways, each 6 ft. 5½ in. between guides. The third compartment contains a steel escapement stairway 2 ft. wide, and set on a 45-deg. angle. The stairway is

Drill Hole No. 130

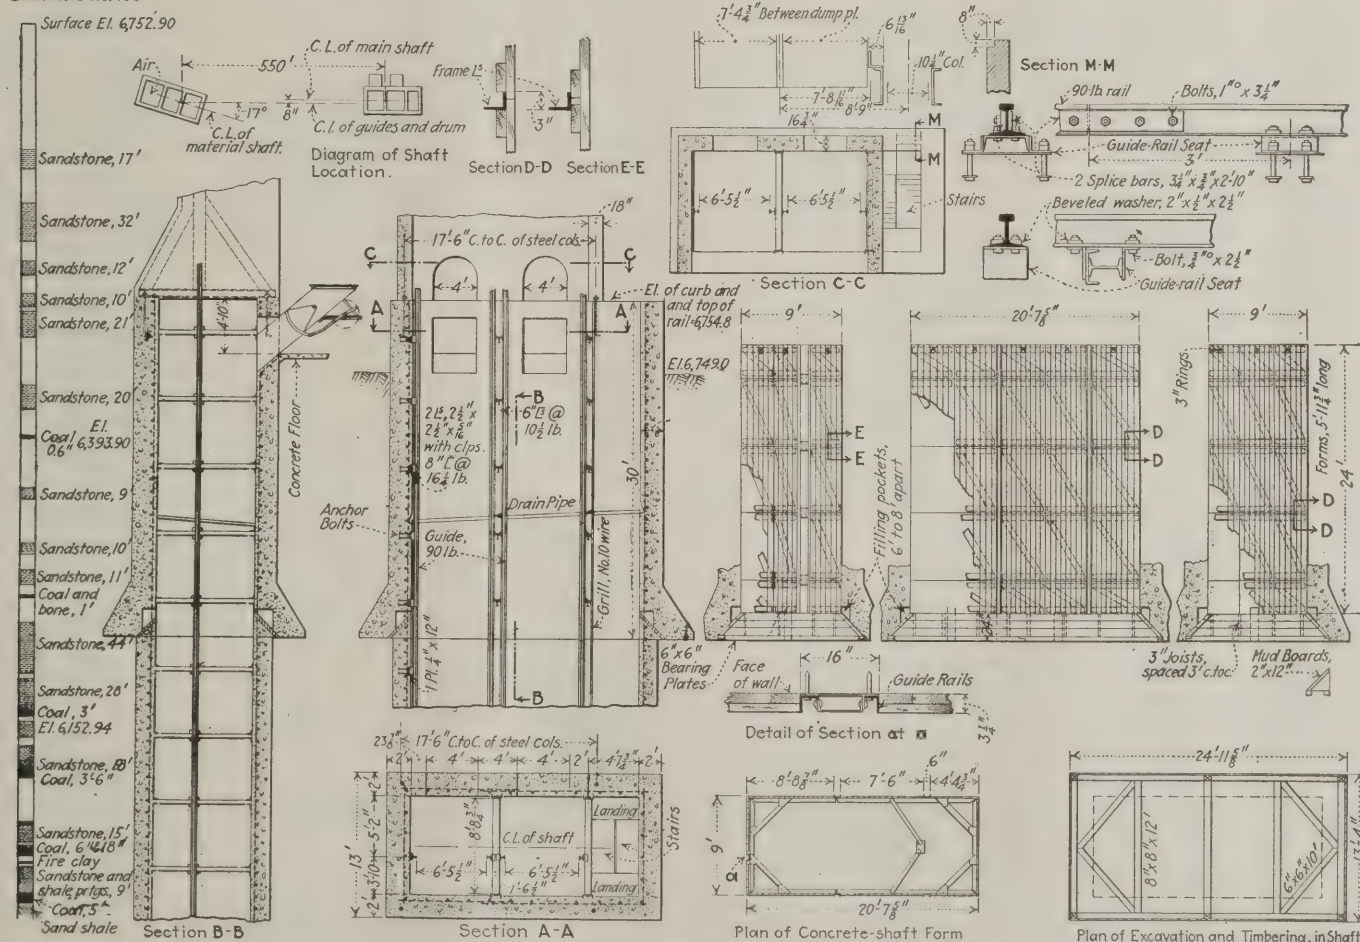

FIG. 3—CONSTRUCTION PLAN OF THE MAIN SHAFT WITH DETAILS OF GUIDES, BUNTONS AND CONCRETE FORMS

The main shaft has two skip compartments, each measuring 7 ft. 4 in. from buntun to buntun or from wall to buntun as the case may be and being 9 ft. wide from wall to wall. It also has a stairway. The guides, it will be seen, are set 8 in. to one side

of the center line of the shaft for the purpose of accommodating the skip. The buntuns are set so that they can be removed, which is of advantage in case of a shaft wreck. The guides are set on brackets at the wall lines.

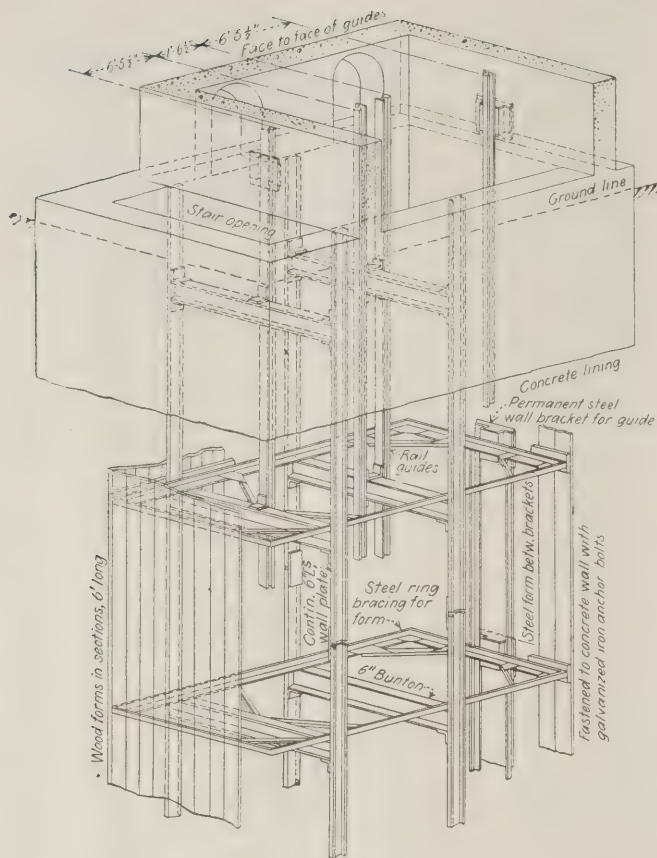

FIG. 4—ISOMETRIC PROJECTION SHOWING DETAILS OF MAINSHAFT CONSTRUCTION

The buntions and wall plates with steel ring bracing hold the form in place, and the concrete is then poured. This method simplifies construction work and relieves the crew of all but a minimum of plummet lining and accurate measurement. The method was so exact and satisfactory that the guides did not in any place need shimming to hold them in line.

protected from falling coal by a continuous iron grillage. The arrangement at the bottom of this shaft will be described in a later article.

Fig. 3 shows a typical cross-section through the main shaft. Attention is called to two features of this shaft arrangement. First, the buntions are so set as to be removable. This is a great advantage in case of a shaft wreck, and a decided improvement over the method of concreting the steel beams into the shaft wall. Second, the guides are set on brackets at the wall lines. Question has been raised with regard to the innovation, some having suggested that it would be difficult to get the guides in line.

The method which has been devised for placing in the shaft the permanent steel framing and the concrete forms in conjunction therewith simplifies the construction work and relieves the construction crew of all but a minimum of plumb lining and accurate measurement.

Sectional wood forms are used and steel angle rings made up especially for each size of shaft are the only interior bracing and spacing members required. The steel bracket carrying the end-wall guide is accurately set by bolting it to the ring angle spacer before the form is filled, and a single plumb line at either end of the shaft is all that is required to plumb the sets which hold the forms.

The permanent steel wall plate, buntions and guide brackets are all set before the form is poured and the chances for misalignment are reduced to a minimum. The steel guides in this entire shaft were set without

a single instance of shimming and throughout the entire shaft the variation of execution from design is not more than $\frac{1}{4}$ -in. Fig. 4 shows an isometric view of the method of construction described.

The auxiliary shaft (Fig. 6) is of the same general type of construction as the main shaft. It is 780 ft. deep from surface to bottom landing, with an additional depth of 16 ft. for a 12,000-gal. water sump at the side of the shaft. The inside dimensions of this shaft are 10 ft. 6 in. x 25 ft. 3 in., the shaft being divided at about the $\frac{1}{3}$ points by a 9-in. concrete partition wall and a steel buntion respectively.

This partition wall permits the use of this shaft for both downcast and upcast air, the primary air compartment being 95 sq.ft. in area. The other two compartments of the shaft are given over to two cageways, the cage platform being 10 ft. long with 6 ft. 3 in. between guides.

The horizontal reinforcement of this shaft is by $\frac{3}{4}$ -in. round bars. At the sides these are 18 ft. 6 in. and 10 ft. 6 in. long, lapped 2 ft., and set on 9-in. centers. At the ends they are 12 ft. 6 in. long and spaced at 12-in. intervals on alternate faces of the wall. This refers to the main part of the shaft. At the top the horizontal side reinforcement is 11 ft. and 19 ft. long lapped 2 ft. and set at $7\frac{1}{2}$ -in. centers. The horizontal end reinforcement is 13 ft. 6 in. long and set also at $7\frac{1}{2}$ -in. centers. The partition-wall reinforcement is 13 ft. 6 in. long and spaced at 12-in. intervals. All the vertical reinforcement is of $\frac{1}{2}$ -in. round bars 14 ft. long spaced 2 ft. apart and lapped 2 ft. on alternate faces of the wall.

The arrangement at the bottom of this shaft is comparatively simple. A pumproom measuring 9 ft. x 10 ft. 6 in. is located at one side of the shaft and is set directly over the water sump. This pumproom houses a triplex reciprocating $5\frac{1}{2}$ x 8-in.

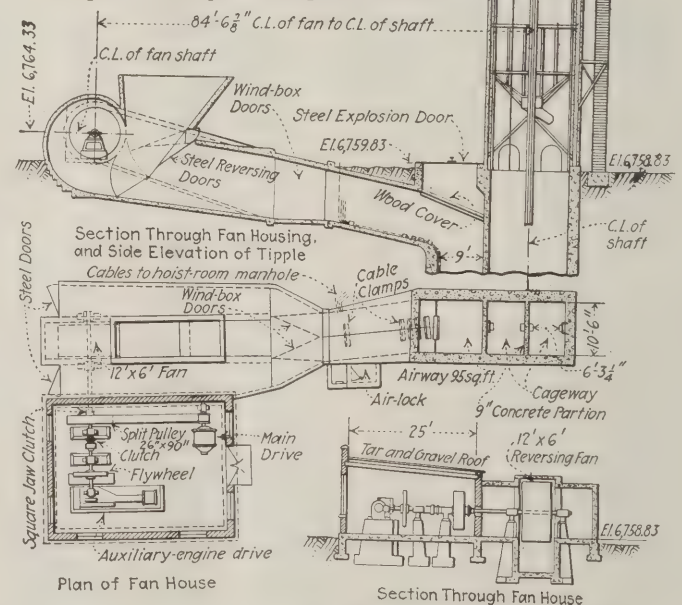

FIG. 5—MATERIAL HEADFRAME WITH SECTIONS THROUGH FAN HOUSE

The shaft to which these structures pertain has cages instead of a skip. The airway is 9 ft. x 10 ft. 6 in., giving a cross sectional area of 95 sq.ft. Immediately above it are a wood cover to relieve the pressure in case of an explosion and steel explosion doors which when blown open can be replaced immediately. The fan is fitted for reversing the air and arrangements are made by which electric drive can, when desired, be replaced by a direct engine drive through a cut-off clutch.

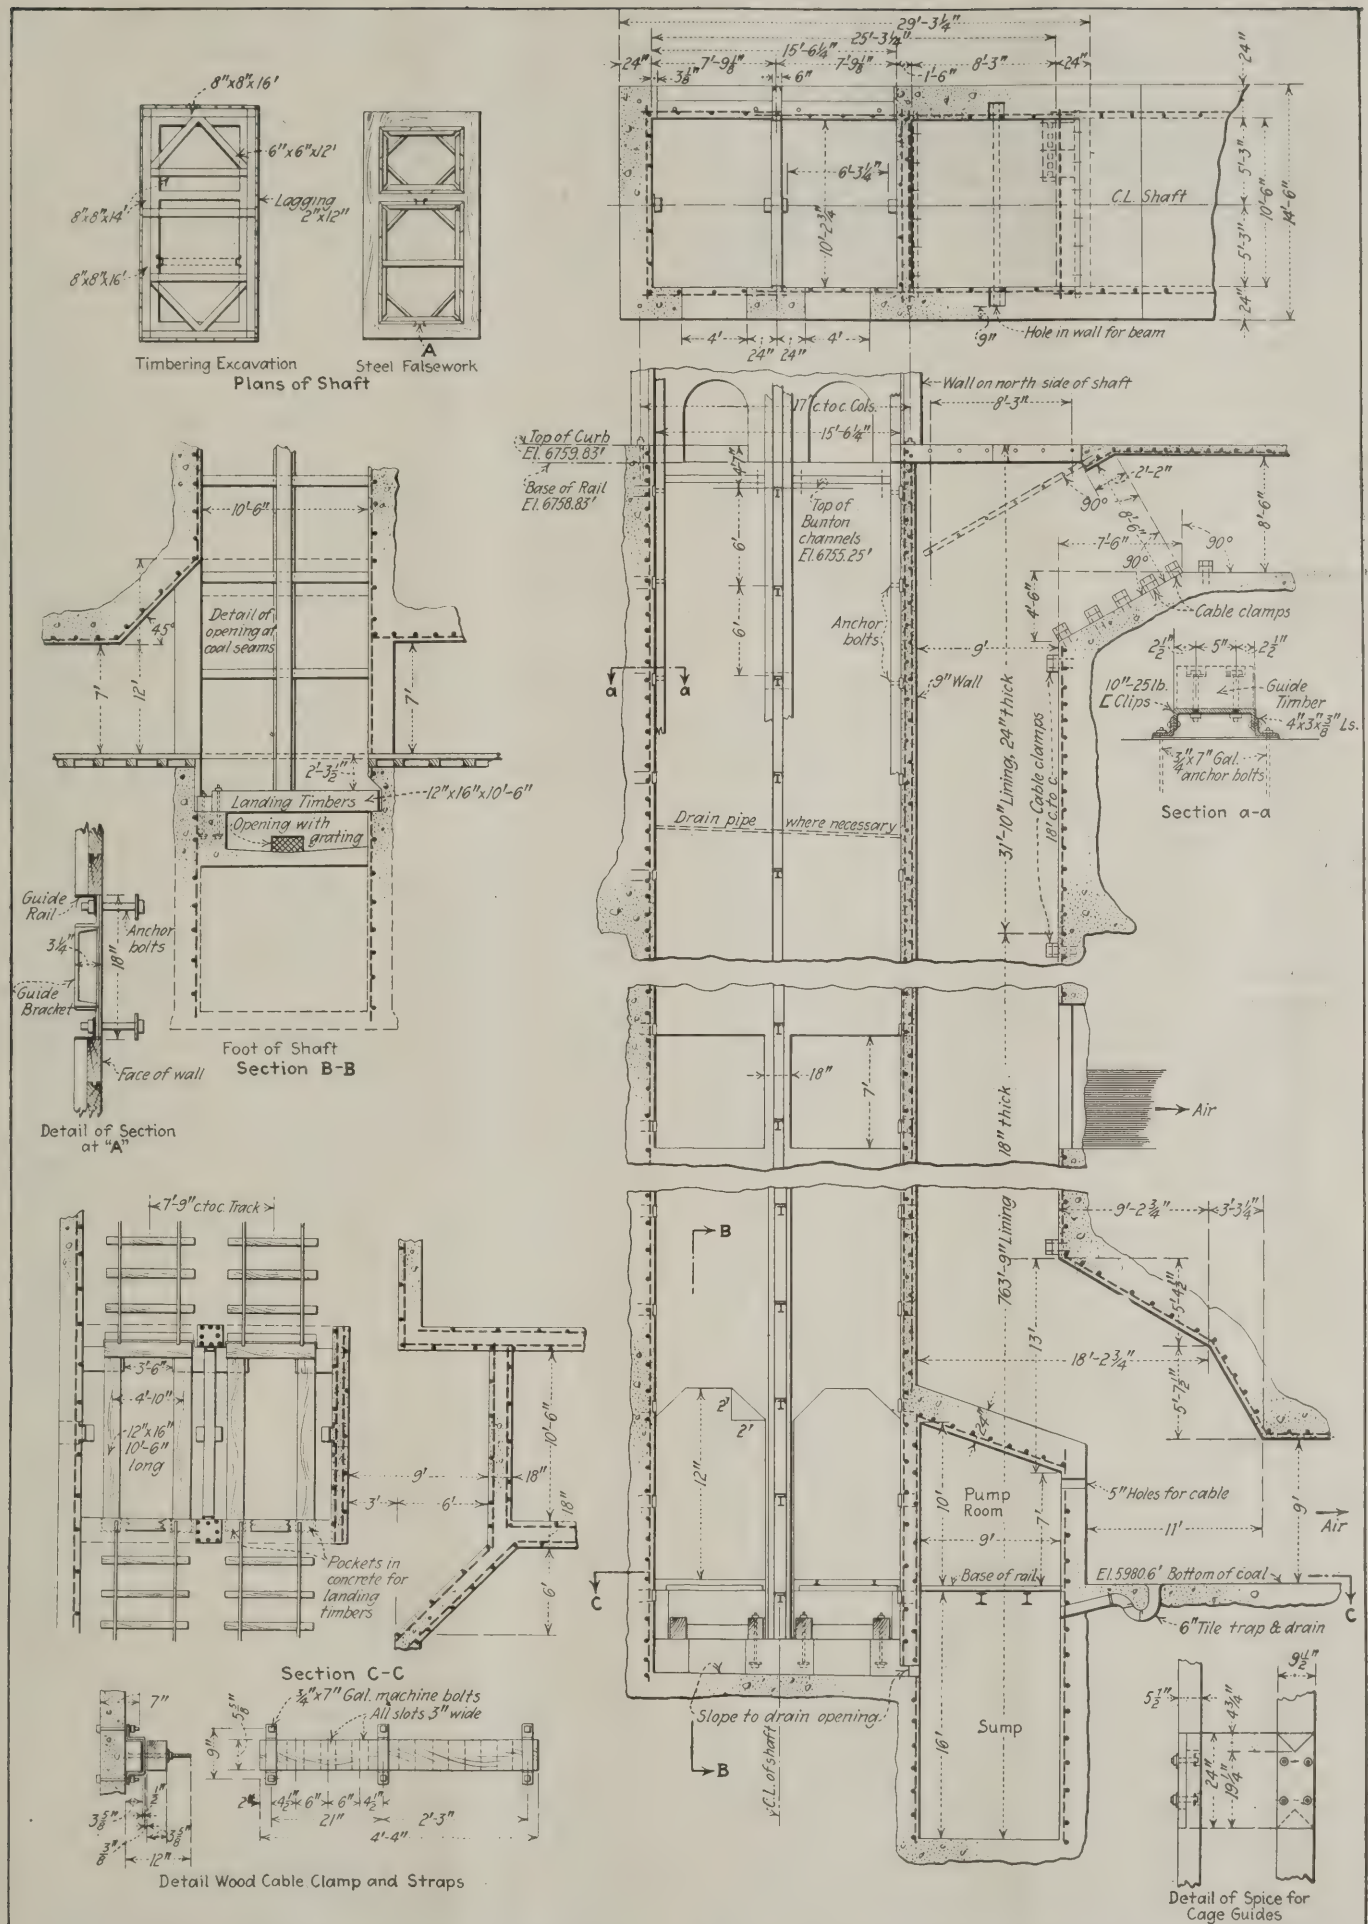

FIG. 6—CROSS-SECTIONS AND DETAILS OF MAN-AND-MATERIAL SHAFT SHOWING BOTH COMPLETED AND FALSE WORK

FIG. 7—AUXILIARY FAN ENGINE PRIOR TO MOUNTING

A 14x24-in. engine supplied with steam from the boiler house takes up the work of driving the fan whenever the electricity fails. This fan has no governor. The speed is regulated solely by varying the cut-off, a much more economical plan than throttling down the steam with a governor.

pump driven by a 35-hp. motor, which is run about two hours a day and can easily dewater the sump in 45 minutes. At the opposite side of the shaft the usual pass-way for men is provided and the entry roof is raised to a sufficient height at the shaft to allow taking rails off the cage. All openings within 50 ft. of the shaft are concrete-lined, and every precaution has been taken to prevent a squeeze on the shaft bottom.

Practically no water is encountered in the mine workings and the only water to be pumped is that which escapes into the shafts. Most of this water occurs in a shale stratum at about the 300-ft. level and runs from 25 to 30 gal. per minute. At present this water is caught at the bottom of the shaft and is pumped thence to the surface. Plans are being made for installing a ring and pump chamber just below the water-bearing strata, thus greatly lowering the pumping costs. Practically all this water will be required for the use of the miners in the bathhouse and for miscellaneous surface purposes. There is not sufficient surplus over and above these needs to justify an attempt to use it in the power plant for boiler-feed water.

The problem of ventilation in all the existing mines of the Gallup field is comparatively simple. Gas is practically unknown, and the only ventilation required is for fresh air in the working places. The fan selected is of the undershot type; it normally runs as a blower and is guaranteed to furnish 300,000 cu.ft. of air per minute at 200 r.p.m. with a 4-in. water gage. The fan shaft is arranged primarily for a motor drive with an emergency steam-engine drive through a jaw clutch.

A brief specification of the fan is as follows: Diameter of fan wheel, 12 ft.; width, 6 ft.; 36 variable-length blades; 9-in. diameter forged-steel fan shaft turned to 8-in. diameter throughout the driving end. Total weight, including reversing doors but no steel housing, 56,000 lb.

The emergency steam engine is a 14x24-in. single-cylinder unit of the piston-valve type, and is direct-connected to the stub shaft of the fan. This stub shaft drives the main fan shaft through a jaw clutch which is disengaged when the motor drive is in operation. The engine is arranged with a hand adjustable cutoff for varying the speed and is not equipped with a throttling governor. A Falls automatic overspeed stop provides for any overspeed emergency that a governor might take care of, but does not control the engine during its normal running.

The purpose of this arrangement is to require the operating attendant to regulate the speed of the engine by varying the cutoff. This means a greater steam economy than with the ordinary method of "throttling

down" the governor to get a variation in engine speed. A pressure-reducing valve taking steam at 175 lb. and reducing the pressure to 125 lb. insures a constant steam pressure at all times, which in turn insures a uniform fan speed. The only time when there is any occasion to vary the speed of the engine is when the mine requirements demand an increased air volume.

The entire fan housing, including scroll and évasé chimney, is built of reinforced concrete. Maintenance and deterioration are thus eliminated and it has been found that when the fan is installed with a concrete casing instead of one of steel the total cost is increased not more than 20 per cent. The air tunnel leading to the shaft is partly below grade, and doors are provided in this tunnel for reversing the air should this ever be desired.

Steel explosion doors are provided at the top of the shaft. These normally are left open. An airtight wooden cover is built below these doors, the idea being that in case of explosion the wooden cover is blown out but the steel doors are unharmed and readily can be closed.

The building which houses the fan drive is of brick construction 25x34 ft. inside, with a 3-in. wooden roof supported on steel beams and carrying a composition roof. Steel sash and $\frac{1}{8}$ -in. ribbed glass provide ample illumination. Fig. 5 shows the general arrangement of the fan setting and Fig. 7 is a view of the engine driving the fan.

Law of Mixtures Applies to Volumes

PROFESSOR J. W. WHITAKER, of University College, Nottingham, England, in correspondence with Kenneth D. Dodds, instructor in metallurgy, School of Mines, University of Pittsburgh, draws attention to an oversight in his article entitled "How to Calculate Washed Coal and Refuse from Ash and Sulphur Determinations," which appeared in *Coal Age*, April 19.

He says that the law of mixtures cannot be applied to the specific gravity of a mixture unless the volumes of the constituent bodies be taken instead of the weights. He illustrates the distinction as follows:

"Consider mixtures of coal and shale, the specific gravity of the coal being 1.25 and of the shale 2.5. If equal *weights* are mixed, the specific gravity of the mixture is not $(1.25 + 2.5) \div 2 = 1.875$, for this reason:

A gram of coal has a volume of $\frac{1}{1.25}$ c.c., and a gram of shale, a volume of $\frac{1}{2.5}$ c.c.

Hence 2 grams of the mixture have a volume of

$\left(\frac{1}{1.25} + \frac{1}{2.5}\right)$ or $\frac{3}{2.5}$ c.c., and 1 gram of the mixture has

a volume of three-fifths of a cubic centimeter. Hence 1 c.c. of the mixture has a mass of $5 \div 3$ or 1.667 grams, or in other words, the specific gravity of 50:50 mixture (by weights) is 1.667. If we mix equal *volumes* of coal and shale, the specific gravity of

the mixture will be $\frac{1.25 + 2.5}{2} = 1.875$."

Professor Whitaker's criticism was not directed at the argument or conclusions presented in the article in question, and in fact it applies to a parenthetical illustration. His example shows clearly, however, that volumes must be considered when calculating specific gravities of mixtures.

Thin Layer of Coal Charred at a Low Heat on Traveling Platform of Hot Metal Plates, Saving Byproducts*

Low Heat Conductivity of Coal at Low Temperatures Makes Distillation Slow and Expensive—Difficult to Spread Thin Layers of “Molten” Coal and Prevent Carbonization on Oven Walls—How New System Meets These Problems

BY R. D. LAMIE

Huntington Coal Distillation Co., Huntington, W. Va.

IN THE familiar byproduct oven coal is coked at a relatively high temperature, with the consequent production of hard metallurgical coke and the condensation of the tars, light oils and ammonia and the utilization of non-condensable gases, the major idea being the production of hard coke for blast furnaces, and the obtaining of byproducts being a matter of only secondary consideration. However, this form of utilization is not without its limitations because of the restricted and specialized use of its main product—coke.

Hard metallurgical coke does not make a satisfactory domestic fuel and has little or no use for power purposes, two important fields. The problem, therefore, becomes one of supplying these markets with a satisfactory fuel, at the same time recovering the byproducts.

For a long time the possibilities in this field have been given intermittent attention, but work has been particularly active in this country since 1913, when Parr and Olin published the results of their investigations into the low-temperature distillation of coal.

They and subsequent workers were able to show that if high-volatile coal was coked at moderately low temperatures—1,000 to 1,200 deg. F.—the resulting products were of an entirely different character from those produced in the familiar byproduct oven. The coke obtained was light and porous, and had practically no structural strength; in fact it is not coke, as we ordinarily understand it but a product midway between coke and coal, as it still retains a part of its volatile matter.

The most notable difference, however, was in the yield of byproducts, the quantity of tar being about three times as much as by the older process, and the non-condensable gases, though smaller in volume, are much higher in heat units.

TAR THIN AND BETTER SUITED FOR MOTOR USE

Further, the character of the tar was different. It is much thinner and contains a larger percentage of low-boiling constituents. The creosote fraction is larger. The higher boiling fraction does not contain naphthalene, and the percentage of pitch is less. In fact it more nearly resembles crude oil than the older high-temperature process tar.

With this knowledge came the realization that with a practical method for the handling of the process an entirely new field of usefulness was opened for high-volatile coal. The semi-coke could be adapted to domestic and industrial purposes; the tar could be refined into motor spirit, creosote oil and lubricating oil; the gas could be mixed with water gas to make a gas for

domestic consumption having the required number of heat units.

The problem is of great economic importance and much time and money has been expended in an attempt to evolve a process which will be practical from the standpoint of investment and return. Numerous inventions have been brought out, with varying success, some of them quite ambitious in extent, but mostly lacking in study and understanding of the fundamental principles involved.

The difficulties are largely mechanical. Coal, first of all, is in itself a poor conductor of heat. In the older high-temperature byproduct coke oven, a long, narrow room is filled with coal and the sidewalls heated by means of combustible gases to a high temperature. This heat, because of the high potentials used and the length of time over which it is applied, is gradually transmitted to the coal. While this process is slow—from 16 hours up—still, because of the large mass involved—16 to 18 tons—it is still within the limits of profitable application.

If, however, lower temperatures were used in the side walls, so that at no time would be the coal be subjected to a greater heat than 1,200 deg. F., the time would have to be so prolonged as to carry the process beyond any possibility of an economic return. It is evident then that another method must be devised.

DIFFICULTIES IN BAKING THIN COAL LAYERS

Attempts to solve the problem have been mainly directed along two lines—one being that in order to overcome the coal's inertia of heat transmission, it is coked in a thin layer which is spread by means of revolving paddles or screws over the walls of a strongly heated retort, the layer of coke thus formed being constantly removed. High heat potentials are used around the shell of the retort, but the temperature inside is supposed to be kept low by the constant agitation and admission of fresh, cold coal. This, of course, is not strictly a low-temperature process.

The other general line of procedure investigated has been to heat the coal contained in a retort to a uniform degree of temperature, by means of hot gases, circulating or otherwise, and at normal or reduced pressure. This is strictly a low-temperature process, inasmuch as the degree of heat to which any particle of the coal is subjected is never greater than the low-temperature range, which is 1,250 deg. F. However, the coking time cannot but be prolonged so greatly that the output will not be sufficient to assure commercial success.

The most ambitious attempt in this country has been made along the first lines. A little study, however, would show that the mechanical difficulties of this type of retort would be great. Coal, when heated, softens and

*Abstract of paper entitled “Low-Temperature Distillation of Coal,” read before the West Virginia Coal Mining Institute, June 13, 1923. This is the system that Henry Ford is installing at the River Rouge Plant, Detroit, Mich., and Walkerville, Ont.

becomes sticky, and the spreading of it uniformly in a thin layer over the walls of the retort is a practical impossibility.

Further, under the pressure of the paddles or screws a hard layer of coke is inevitably built up on the walls of the retort. This makes it difficult for heat to be transmitted into the retort, and as it gets thicker it will stop the paddles or screw from revolving unless frequently removed. This necessitates closing down and cooling the retort, and a loss of production. Furthermore, the product will not be uniformly coked, because the conditions in all parts of the retort will not be the same.

Some particles are bound to be overheated and therefore overcoked, and other particles will not receive enough heat to drive off much or any of the volatile matter. The resultant product will be a mixture of coal, semi-coke and hard coke. Under these conditions the byproducts also are bound to be affected. There are other mechanical difficulties inherent in this type of retort, which need not be discussed at this time.

During the past year a type of low-temperature distillation oven has been developed in a practical way. It has already proved its ability to work almost indefinitely without mechanical trouble of any kind, and at the same time has a coking capacity per unit of investment about twice that of the present-day high-temperature byproduct oven. This coking unit is known as the Piron oven.

In the Piron system the coal is coked in a thin layer

on a movable platform or a series of jointed metallic plates. The heat to distill the volatile matter is transmitted to the coal through the metallic plates, the heating element being a metal bath with internal heating flues. The temperature of the bath is easily controllable within narrow limits, and if desired need not vary 25 deg. F. in a month. No part of the coal is subjected to a greater heat than that necessary to distill it under low-temperature conditions, and therefore, the resulting products are uniform in quality. In fact, so far as the quantity of volatile matter left in the semi-coke is concerned, this can be varied within limits to suit the operator.

The process is a continuous one. Raw coal is fed continually onto the platform or conveyor. After making almost one complete passage through in the oven, the necessary quantity of volatile matter is all driven off, and the dry, porous residue drops off the plates of its own accord. There are no moving parts other than the conveyor inside the distilling chamber, and therefore the coal is not disturbed while in its sticky state.

The resulting residue is a semi-coke now known as carbocite. It is a soft, easily pulverizable substance, and in its natural state, as it comes from the oven, it can be burned directly under steam boilers for power-raising purposes. It is absolutely smokeless and burns with a yellowish blue flame not unlike charcoal. The heat is intense and the ash light and fluffy.

MORE HEAT PER TON IN CHAR THAN IN COAL

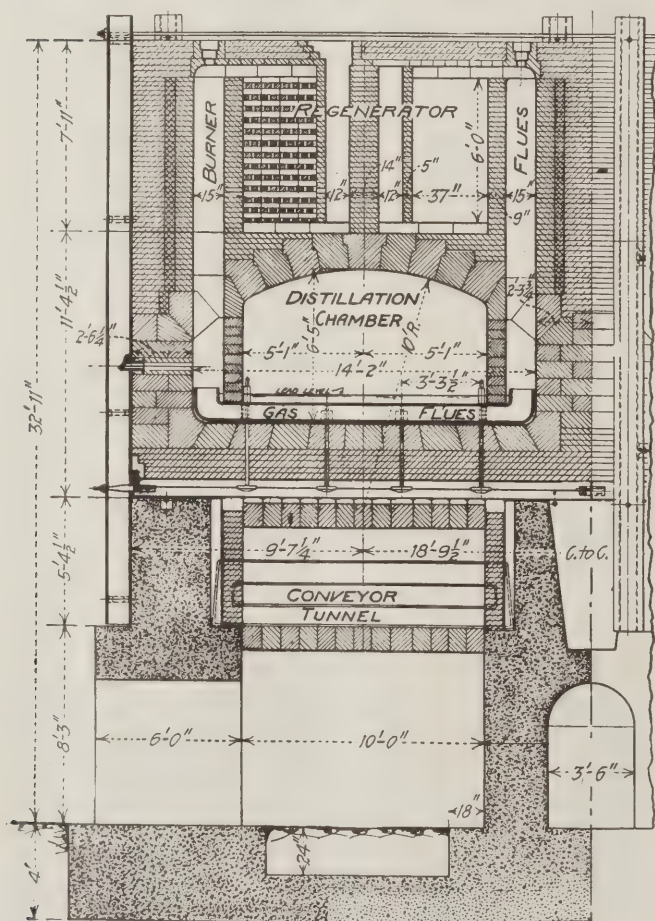

As compared with the coal from which it is made, carbocite will contain only from 10 to 12 per cent volatile matter. This can be increased, however, up to about 18 per cent at the will of the operator. It will be bone dry, and the ash will have been increased by the percentage of volatile taken out. That is, if you start with 8 per cent ash and 35 per cent volatile in the coal, the carbocite will have, say, 10 per cent volatile and 10 per cent of ash, but because the volatile matter left in the carbocite is largely hydrogen, there will be more thermal units per pound than in the coal from which it is made; this in spite of the fact that the percentage of ash has been increased.

Four methods are open for the commercial utilization of carbocite. First, as mentioned before, it can be burned directly under a boiler; second, it can be pulverized and burned in any way that pulverized coal is now burned; third, it can be, under suitable conditions, completely gasified; and fourth it can be briquetted into a fuel suitable for domestic or industrial purposes where a smokeless fuel is necessary and the quantity consumed per day is small.

The yield of tar by low-temperature distillation, as pointed out before, is much larger than by high-temperature distillation and will run from 20 to 30 gallons per ton of coal carbonized, the quantity and quality depending almost entirely on the kind of coal used.

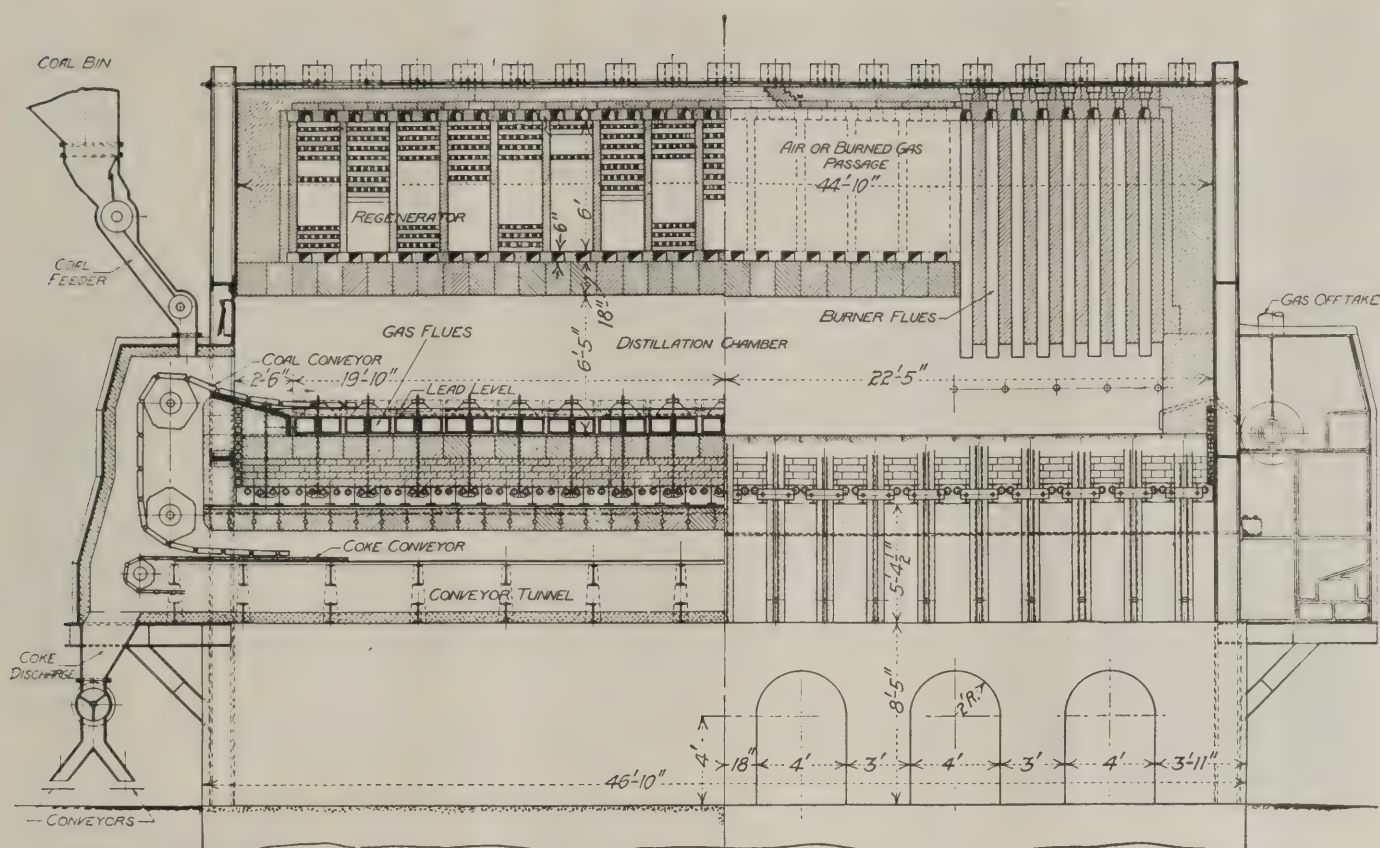

LOW-BOILING FRACTIONS PREDOMINATE IN TAR

In this tar the low-boiling fractions predominate. These fractions are quite suitable for use in internal-combustion engines, and therefore the high-volatile coal of this state has now become an actual source of gasoline. It is unnecessary to point out the economic importance of this fact. It is quite evident to anyone that we are using up our natural resources of crude oil very rapidly, and this year will see a consumption of gasoline undreamed of even during the war period,

SECTIONAL ELEVATION, EMIL PIRON OVEN

The oven used at Huntington, W. Va., here cross-sectioned, had a daily capacity of 25 tons and was a demonstration unit only. Lead rests on the top of gas flues and is kept molten by the heat conducted by them. On this lead, metallic conveying plates float carrying a half-inch of coal which by the time it has passed through the oven is reduced to semi-coke.

LONGITUDINAL SECTION OF OVEN SHOWING COAL FEEDING AND CONVEYING ARRANGEMENT

This unit is typical of the furnaces now being erected by the Ford Motor Co. of Canada, Ltd., at its Walkerville (Ont.) plant and by the Ford Motor Co., at its River Rouge plant, but the River Rouge furnaces are 10 ft. longer. The commercial oven will embody a clay refractory furnace 44 to 52 ft. long having two longitudinal

arched chambers 14 ft. wide and 6 ft. 5 in. in total height provided with curtain walls at each side to separate the heating and exhaust chambers from the distillation space. Cast-iron U-shaped flues in twin form connect the heating and exhaust chambers, the lower section of the flues being completely submerged in a bath of molten

lead with refractory protection for the upturned ends. These flues are closely placed, providing heating gas passages spaced 14 in. apart under the entire lead surface. Regenerators or recuperators rest on top of the oven proper. The coal is laid so thin on the conveyor that it readily takes up heat and is distilled.

when we supplied a greater share of the world's needs.

In the seven years between 1914 and 1921 the production of gasoline increased 426½ per cent; in 1914 the United States produced, in round numbers, five billion gallons of gasoline. The production this year probably will reach eight billion gallons.

Assuming that it is possible within a reasonable length of time to process fifty million tons of West Virginia high-volatile coal per year, what would it mean to this state in dollars and cents?

From fifty million tons of coal we would obtain 1,250,000,000 gallons of tar, 150,000,000,000 cu.ft. of surplus gas with a thermal capacity almost as high as that of natural gas, and 300,000 tons of sulphate of ammonia.

From this quantity of tar can be obtained 500,000,000 gallons of motor fuel equal, if not superior, to any now being produced from crude oil, and worth \$90,000,000; 150,000,000 gallons of creosote oil for creosoting poles, ties and timbers, a great deal of which is now imported, worth \$15,000,000; 300,000,000 gallons of lubricating oil, worth \$60,000,000; together with other recoverable values, amounting to \$15,000,000 to \$20,000,000 dollars more, a total from the tar of about \$180,000,000. The gas also might be sold for industrial purposes. Basing its value on coal at \$6 per ton burned under the boilers, it will bring in an additional income of \$40,000,000. The sulphate of ammonia will net \$10,000,000 more, or a total of \$230,000,000, or \$4.60 per ton of coal carbonized.

And we still have the carbocite left—37,000,000 tons of it—usable for any purpose for which coal can be

used. Briquetted it can be sold in competition with anthracite for domestic or other purposes. Not only is it a substitute for anthracite but it can actually be made a superior fuel, because it has less ash and no unconsumed particles are left in the ashes.

Natural gas is an ideal fuel, but the gas resources of West Virginia are rapidly being depleted. Today our industries are looking elsewhere for their power. With careful regulation natural gas as an economic domestic fuel may last for thirty years, certainly not much longer. What is going to take its place? That question can be answered now. Coal will be completely gasified. It will be brought to the mouth of the mines, treated in low-temperature ovens to recover the by-products, motor spirit, lubricating oil, ammonia, etc., and the resulting semi-coke completely gasified. The gas will then be pumped through pipe lines to the cities, and the byproduct shipped to consuming centers.

This idea while revolutionary, is within the bounds of possibility in the near future. In the meantime low-temperature ovens will be built for the more economical production of power. Already large plants for this purpose are under way. The most interesting phase of the low-temperature development, from the high-volatile coal-producer point of view, is the utilization of carbocite as a domestic fuel, because it will open up an entirely new field for this particular coal.

It also will have a marked tendency toward stabilizing the industry because the waster will be put to such a great disadvantage that he will have to drop out and leave the field to the people who are willing to utilize everything and waste nothing.

New Equipment

Potential Transformer Fuses and Fuse Blocks for Indoor Use

SAFETY on the front of switchboards having been brought to a high standard attention now is being paid to the most dangerous pieces of equipment behind the board. For instance, a new inclosed cartridge type potential transformer fuse and fuse block made for voltages of 2,500 to 25,000 for the protection of indoor potential transformers has been placed on the market.

2,500-VOLT FUSE BLOCK

Open view showing method of mounting the fuse in the cover. In renewing the fuse the cover and fuse are disconnected, making it safe to handle the fuse for renewal or inspection.

It can be used also to protect other circuits where the current does not exceed one-half an ampere. The fuses can be applied without preventive resistances in locations where the maximum short-circuit current does not exceed the interrupting capacity of the fuse. When a preventive resistance is used the short-circuit current will be limited, ir-

respective of the power back of the fuse, to a value within the interrupting capacity of the fuse. For 15,000- and 25,000-volt service the same fuse is used, with a different preventive resistance to limit the current and a different fuse base for each of the two voltages.

The 2,500-volt fuse base is provided with a cover of molded insulation which holds the fuse and provides for its safe handling. The higher voltage bases use corrugated post-type insulators.

Some of the special features of these fuses and fuse blocks, recently placed on the market by the Westinghouse Electric & Manufacturing Co., are their high interrupting capacities, strong non-absorbent fiber casings and provision for the proper venting of gases.

Ball-Bearing Pump Is Self Priming

AN INTERESTING feature of a new ball-bearing, motor-driven pump of 75 gallons capacity, known

SELF-PRIMING PUMP

The fact that this pump is automatically primed as soon as it is started obviates the usual worry that attends most centrifugal pumps.

as the Fulflo pump, is its self-priming characteristic. It also is equipped with a free-floating impeller having anti-clog features. In smaller capacities the same type of pump, which is manufactured by the Fulflo Specialties Co., of Blanchester, Ohio, may be used for a central-supply tank system for feeding heavy cutting tools or for pumping oil, brines, enamels, etc., in the shop or factory.

New Coal-Loading Boom Eliminates Necessity of Sorting Cars

A NEW and improved swiveling loading boom, depicted in the accompanying illustrations, is being put out by the Link-Belt Co., of Chicago. It is known as the "Knox Gon-Box Loading Boom."

An important feature of the Knox boom is its extreme flexibility, as it is able to swing and swivel with such freedom as to permit the loading of either gondola or box cars, from which fact it derives its name.

If gondola cars are being loaded the boom is swiveled over the center of the railroad track and thus delivers the coal to the center of the gondola car—acting similarly to ordinary loading booms. While in this position it also can be lowered to within a few inches of the car floor.

When box cars are loaded the boom is swung parallel to the loading track, where it delivers the coal to a chute leading to the box-car loader. Changes from box to gondola cars, or vice versa, can be made quickly and with ease.

FLEXIBLE COAL-LOADING DEVICE

Owing to the difference in types of cars to be loaded this boom will save much expense by eliminating the necessity of sorting out cars of various types at the mines.

Taking Coal by the Air Route to Coaling Station

Aerial Tramway at Williamson, W. Va., Eliminates Two Bridges, Much Track and Trestling, Yet Cuts Hauling Costs—Lifting Coal 85 Ft.—Easily Handles Thousand Tons in Eight Hours

BY CHARLES K. TRABER AND WALTER C. RICHARDS
St. Louis, Mo.

IN THE last few years the method of transportation in mountainous country from mine to railroad has been greatly changed. The aerial tramway, which has been used for twenty-five years or more,* at first almost entirely for the handling of high-grade ores in mountainous districts, has gradually extended its operation and now has been adopted by many industries. It seems destined within the next generation to carry a large proportion of the coal produced in mountainous regions, especially from the higher seams.

Ten years ago an aerial tramway was considered usually only after other methods of transportation had been eliminated on account of the difficulties of terrain. Now it often happens that an aerial tramway will compete with a railroad switch or other means of transportation under conditions favorable to the latter, for among other advantages it always delivers the coal directly at the top of the tippie, just where it is wanted, and without the expense of costly trestle work or elevating machinery.

Aerial tramways may be divided roughly into two classes: (1) Continuous systems, where there are a number of carriers continually proceeding around a circuit, receiving the material at one terminal and delivering at the other, thus approximating a belt conveyor in its continuous supply of the product, and (2) the two-bucket aerial tramway, as it is usually

known. This latter consists of two usually rather large carriers, each moving on its own track rope, the one going out as the other returns.

This type of tramway is especially useful where the coal lies somewhat high on the hillside with the railroad in the valley and where the contour of the ground is such that the distance between these points can be made in a single span. Under these conditions the operation is by gravity, the carriers move at a high speed, and large capacities can be attained with an installation that is not only reasonable in first cost but extremely economical, both as regards maintenance and operation.

MAIN-TRACK CABLES MAY LAST TEN YEARS

Operation cost with this type of aerial tramway reduces itself practically to the wages of one man and a little oil for keeping the machinery lubricated. The maintenance cost represents the replacement of certain parts of the rolling stock at long intervals and the ropes at intervals even longer. Instances are on record where the main-track cables of this type of tramway, which represent the principal expense, have lasted as much as ten years. These cables, in order to give this service, must, of course, be well taken care of and should be of the locked-coil type, as shown in the illustration

LOCKED-COIL MAIN-TRACK ROPE

By reason of its smoothness it forms a good running track for the buckets and will last for years. Moisture penetrates it with difficulty. It will be seen that this rope lacks the hemp core and is therefore less flexible than most ropes.

NOTE—The headpiece shows an aerial tramway at Williamson, W. Va. In the background can be seen the shed under which coal is conveyed by a belt to the loading terminal, which is close by a sidetrack where cars can be loaded for the market. The aerial tramway crosses the railroad track and steam in a direct line.

*An aerial tramway was erected by a Dutch engineer, Adam Wybe, for the city of Dantzic in 1644. The first ropeway of any note was built in the Hartz Mountains in 1860 by Baron F. E. von Ducker, but, of course, progress at first was slow, and in this country the time set by the author probably well delimits the period during which the aerial tramway has been generally known.

—EDITOR.

TRACTION ROPE
A flattened-strand rope is used for attaching the buckets.

accompanying this article. The use of this type of rope also insures long life for the carrier wheels, which is especially important on continuous-system tramways where a *number* of carriers are used.

Sometimes it is necessary to convey a long distance, and aerial tramways have been installed in this country as long as sixteen miles. Whenever the contour of the ground is such that intermediate supports are required, it almost always is necessary, except for cases of extremely small capacity, to use the continuous system. This type of tramway usually requires more labor than the two-bucket type, but it still affords an economical method of handling coal both as to maintenance and operation.

The continuous-system aerial tramway is less generally known in the coal fields than the two-bucket type, and therefore merits description in some detail.

Such a tramway has been designed and built for the Pond Creek By-Products Colliery of the Fuel Department of the Norfolk & Western Ry. It is located at Williamson, W. Va. This property was acquired by the railroad company for the purpose of furnishing coal to a large coaling station to be established in the Williamson yards. The mine openings are on a hillside somewhat less than half a mile from the coaling station.

The coal handled comes from two seams, the Thacker and the Pond Creek. The upper seam is 320 ft. above the level of the valley, but the lower seam is only 50 ft. above this lower level. Passing through a rotary dump, the coal that comes from the Thacker seam is fed to a rope-and-disk conveyor about 550 ft. long, which brings the coal to the level of the lower seam; at which point it is picked, and may be crushed if desired.

Here the coal from the lower level joins the stream of coal from above and is carried with it by a belt conveyor about 380 ft. long to the loading terminal of the aerial tramway leading to the coaling station already mentioned. This transfer point is arranged so that if the coaling station is not in need of this fuel,

the coal can be diverted to a similar belt conveyor which takes it to a side track where it is discharged into railway cars.

The aerial tramway is about 1,600 ft. long from loading point to coaling station and it crosses in that distance Pond Creek and the Tug River, both of which during heavy rains greatly overflow their banks. The elevation of the top of the coaling station where the coal must be delivered is about 85 ft. above the point where the coal is fed to the aerial tramway.

Consider now what this would mean if some other system of transportation were used. A railroad switch would mean two heavy bridges, and then the coal would be delivered only at the bottom of the coaling station and would have to be elevated with a bucket elevator or skip hoist. If a series of belt conveyors were used, it would also mean expensive trestle work.

With the aerial tramway, however, it was necessary only to build at the loading end a simple structure of timber for receiving the coal from the bins located at that point, then to stretch the ropes from that structure to the top of the coaling station, with several intermediate supports, which are in the shape of A-frame towers. The coal, then, is fed to the tramway buckets through chutes from the storage bins; the carriers are automatically attached to the pulling rope and proceed at a uniform speed to the coaling station, where their load is automatically dumped, and they return to the loading station without further attention.

The only labor required is that of filling the buckets through special undercut roller-gate chutes, and as the buckets come to a stop before being loaded, there is no chance of spillage, unless the attendant is inexcusably careless.

The rated capacity of this aerial tramway is 125 tons per hour, but as much as 140 tons has been handled without difficulty. To do this three men are required; that is, three men represent the entire crew operating this aerial tramway. The gage of the tramway—the distance between track ropes—is 10 ft., and consequently there is no chance of the buckets interfering with each other in their travel over the line.

Loading Station

On the left can be seen the 380-ft. belt conveyor that brings up the coal from the crusher and picking booms to the loading station and the belt-conveyor that elevates to the tippie whatever coal is not needed at the coaling station. On the right, running toward the rear-ground, can be seen the A-frames supporting the continuous-system aerial tramway 1,600 ft. long leading to the Williamson yards. The track to the tippie can be seen in the immediate foreground.

How Coal Is Received

Coal comes to the yard, carried in equipment that utilizes space not needed for main tracks, side tracks, water towers, signal houses, roundhouses and what not—namely, the air. The coal gets to its destination without modifying an iota the original layout, which it could not do if brought by a track. This coaling station is on the Norfolk & Western Ry. Note how far the returning buckets are from those approaching the receiving tower. They could not injure each other in passing even in a heavy wind.

The buckets have a capacity of 35 cu.ft. and hang by a structural steel pendant from a truck equipped with four wheels. This four-wheel truck allows of a nice distribution of the load and prevents excessive bending in the track cable, which would be experienced with these heavy loads if a two-wheel truck were used. The truck cable is of locked-coil construction, which presents an absolutely smooth outer surface, and consequently wears but little, even after long use.

It readily can be seen also that this smooth surface is conducive to long life for the carrier wheels. The traction rope is of the flattened-strand construction, which affords a large area and smooth surface for the

action of the friction grips. The power required is furnished by a 25-hp. motor. Five cents per ton of coal handled will cover operation and maintenance and also will amortize the equipment cost in twenty years.

If conditions of ground had allowed the use of the two-bucket gravity type of aerial tramway the cost would have been even less. The equipment was installed at a much lower first cost than could have been achieved with any other method of transportation, faced as the designers

were with the attendant necessity of bridging the two streams and providing for the deposit of the coal at the top of the station.

The aerial tramway was designed, manufactured and installed by A. Leschen & Sons Rope Co., the special features of the coaling station being designed and erected by Roberts & Schaefer. The work was done under the general supervision of George Duglinson, manager, fuel department, Norfolk & Western Ry., and under the direct supervision of W. A. Wilson, general superintendent, Pond Creek Colliery, and J. H. Dickerson, engineer.

Dr. Morgan Discusses Semi-Coke Processes

ONLY thorough trial on a large scale and at great cost can determine the worth of Henry Ford's project for low-temperature carbonization of coal on a commercial basis, according to Dr. Jerome J. Morgan, member of the American Chemical Society and professor of chemical engineering in the Schools of Mines, Engineering and Chemistry of Columbia University.

"In any discussion of low-temperature carbonization of coal," says Dr. Morgan, "certain fundamental principles in fuel utilization must be kept clearly in mind. 'First: A pound of coal represents a certain quantity of latent chemical energy. Expressed in heat units for an average bituminous coal of medium ash and moisture content, this is roundly 14,000 B.t.u. per pound. This represents the total energy that can be obtained from this pound of coal. No method of treatment can possibly add to this energy.

"Second: Any process of carbonizing coal consumes energy which must be supplied from that originally present in the coal or, as is so often done in the laboratory, from some outside source. Hence the carbonization process is justifiable only when the value of the products of carbonization is greater than the value of the raw coal. In ordinary high-temperature carbonization of coal in a gas retort or coke oven the main products are coke and coal gas.

"The process is justified by the greater 'form value,' that is, value due to form, as a metallurgical fuel of the coke, or as a domestic fuel of the gas. The value of the byproducts, ammonium sulphate and coal tar, help bear the expense of the process, but alone would not justify its use.

CARRIER JUST DISCHARGED

The bucket goes back to the loading station thus tilted. The coal has fallen into the hopper of the coaling station.

"Third: In low-temperature carbonization of coal semi-coke, gas, ammonium sulphate and low-temperature tar are obtained. The semi-coke is not suitable directly for metallurgical fuel; in most cases it requires subsequent treatment for domestic fuel, and only about three-quarters of a pound of it is obtained per pound of coal. The gas from low-temperature carbonization, though richer than ordinary coal gas, is in much smaller quantity, and only about half as much ammonium sulphate is formed as in high-temperature distillation.

"It is only in the case of tar that we find a marked advantage in low-temperature carbonization, and it is to the low-temperature tar that we must look for a justification of the process.

"Fourth: In considering the value of low-temperature coal tar there are many factors which must be balanced. The quantity obtained is considerably greater, often two or three times that from high-temperature distillation of the same coal. Its value, however, in the present market is rather doubtful. As it represents the first step in the decomposition of coal, its composition varies much more owing to the varying natures of the coals being distilled than does the composition of high-temperature tars.

"Many of the current claims for low-temperature tars are based upon work done in Germany on tars from German brown coals, which differ greatly in nature from American coals. This dangerous practice of reasoning by analogy has led to the publishing of many misleading statements.

"Fifth: Finally, whether any proposed process for low-temperature carbonization is a commercial success can be determined only by the balance sheet of a plant which has actually been operated on a large scale for a long time. If Mr. Ford, who has the money to spare, cares to undertake this costly experiment, the results will certainly be watched with great interest by others who have tried it and by American chemists and engineers in general."

Much Trouble and Danger from Explosives Incurred—and All for No Advantage

TIME often is best saved by spending it, and material sometimes is saved by a little frugal waste of it, as an E. I. duPont de Nemours circular written by Arthur La Motte points out. Don't crimp a cap on a piece of

fuse, if the ends of the latter have been exposed to damp air, until you have cut off and discarded about an inch of it. The powder core of the fuse takes up moisture at its end, and this damp powder refuses to burn, so that the spark from the powder may fail to reach the explosive in the cap. Result: An unexploded hole, waste of time digging it out, danger in that operation and risk that part of the cartridge thus extracted may fall into the coal unexploded to injure those who burn the fuel or who handle it around the mines, in the yard or at the point of delivery.

Again, cut off the fuse so as to reach at least 2 or 3 in. beyond the collar of the hole and crimp the cap on the freshly cut end; then you will have more confidence that the powder at that end which is in the cap will be dry and effective. The use of "short" fuse or "skin-em-

backs" is prohibited by law in some states. It is not only dangerous but wasteful, for the effect of the explosion cannot be as great as when the hole is tamped its full length.

Don't cut the fuse with a dull, dirty knife or a hatchet, which bruises rather than cuts its way through

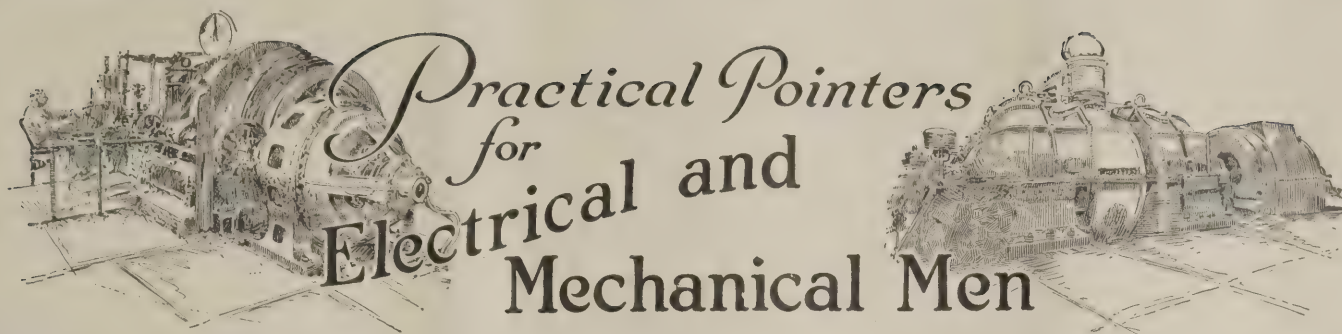

the fuse and is sure to smear some of the waterproofing across the powder train and make the work of the fuse ineffective. A cap crimper will make a straight cut and enable the blaster to bring the powder right up to the

fulminate. Some people cut the fuse with a long slanting cut. No surer and deadlier way of covering the powder at the end of the fuse with waterproofing can be devised. The waterproofing left by such a slanting cut is bent over as soon as it gets inside the cap and tends to insulate the powder from the fulminate. If you *must* use a knife to cut the fuse it must be clean and sharp and the cut must be square.

It is still necessary to add that blasting caps should not be crimped with the teeth, for men still continue to run these unnecessary risks despite all that has been said.

Track Device Automatically Regulates Traffic to Bottom of Slope

TRACK devices made to function by the passage of the wheels of mine cars through them afford automatic operation of track switches, detect loose wheels on the mine wagons and rerail rolling stock that is off the track. There remains another possibility in the use of track devices which heretofore has been little exploited, namely, to open a switch in an electrical circuit, thus lighting a lamp or ringing a bell to signify condition at the place of signaling to the place being signaled. Many opportunities are offered the mine electrician to do electrically what heretofore was accomplished by men. Here is one:

In the Cedar Grove slope mine of the Carnegie Coal Co., Studa, Pa., a loaded trip on its way to the surface encounters a sweeping curve before it arrives at the parting which marks the beginning of the double track on the slope bottom. To pull the loaded trip into the slope bottom would necessitate the construction of a run-around at a point beyond the big curve adjoining the parting and time would be lost in shifting the locomotive from the front to the rear end of the trip. Backing a loaded trip around a curve and through a parting switch is doubly dangerous. Consequently the Cedar Grove management decided that the loaded trip should be dropped to the slope bottom—see Fig. 1—by a flying switch at the parting. The locomotive switches to the empty track and is ready to pull out with the empty trip when the last mine car of the incoming loaded trip is in the clear.

There are two requisites to accomplish this maneuvering with safety: the motorman of the incoming loaded trip must be notified whether there is room or not in the clear for his trip, and the track switch at the parting must be automatic to turn the locomotive to the empty track and direct the mine cars to the loaded track.

At the point *B* are located two green signal lamps. When these lamps are lighted the motorman knows that there is sufficient room on the loaded track for his trip and, accordingly, he does not stop there, but if the lamps are out, he knows that his trip will not clear the parting at point *A*. Consequently, he waits for the signal from the lighted lamps before he drops his trip to the bottom. The distance *AB* is great enough to permit the loaded trip to get up sufficient speed to make the flying switch at the parting *A*. The automatic track switch used at this point is of popular make. A lever on the locomotive throws the switch one way and then another, before and after the passage of the locomotive through it. Though this automatic switch is not new its use in conjunction with the track device herein described is novel and saves the employment of one man.

At a point 15 car lengths from the foot of the slope and 40 car lengths from the parting is a track device which opens or closes the electrical circuit of two signal lamps. This device consists of an angle iron 11 ft. long which is held to the inside of one rail by two leaf springs bolted to the angle and to a short rail which is spiked to the ties, as in Fig. 2. To each end of this angle iron is attached a switch point on an insulating block, which makes contact with a grounded switch point on the main rail.

The two insulated points are connected to each other by means of an insulated jumper and are connected with the lamps by a line which originates as a feeder from the trolley wire.

FIGS. 1 AND 2—AUTOMATIC SIGNAL INCREASES SAFETY AND ECONOMIZES IN LABOR

Track devices on mine-haulage systems make visual signaling very reliable. Here transportation is made both quick and safe.

from the trolley. The return of the circuit is through the track. The circuit is kept open by the spread of the angle iron through the agency of the wheels of the mine cars, which simultaneously spread the contact switches in the electrical circuit. When the last car in a trip passes through the track device the tension of the leaf springs presses the angle iron to the main rail and closes the circuit, thereby lighting the signal lamps at *B*, which notifies the motorman that there is space in the clear for the storage of 40 mine cars on the loaded track

How Induction Relay Operates on Overload

LOOKING over some of my earliest notes, written soon after I began to work in the electrical engineering coal-mining field, I found some sketches which I made on a study that bothered me not a little before I finally found time to work out an explanation for myself. These sketches and notes I am now passing on to you in the hope that they will be of use in explaining a point which may possibly be troubling many a colliery electrician and also in hopes that they will prove the sim-

FIG. 1—OVERLOAD RELAY CONNECTIONS WITH DIRECT-TRIP ATTACHMENT

When a load comes on the power line the relay starts to operate, giving the desired time delay. When this predetermined time is up the relay closes the secondary coil circuit of the direct-trip attachment, thus causing the current transformer to send sufficient current through the trip coil to operate the trip and cut off the overload.

plicity of many supposedly complicated pieces of electrical equipment.

For some time I had been wondering about the mystery which surrounded the operation of the Westinghouse type C O overcurrent or overload relay and of course, not knowing the operation, I felt that there must be many a relay of this type at the mines which was incorrectly connected or incorrectly set. The particular thing about this relay which troubled me was its use with the direct-trip attachment.

After some delving around I found that the circuit shown in Fig. 1 is the one most commonly used and

FIG. 2—INTERNAL CONNECTIONS OF RELAY

The upper studs connect to the contacts, which when closed are relieved of the heavy current by the closing of the auxiliary contacts. Time delay is accomplished by changing the distance between the contacts. The lower studs connect to the relay coil which controls the current setting. Cutting in or out sections of the relay coil by changing the position of a contact-making screw in the connecting block determines the load setting.

which shows the usual correction in its simplest form. This sketch, however, needs a little explanation. Let us suppose the load in the line wire increases. Just as soon as this happens there is an increase of current in the secondary of the current transformer. The circuit from the secondary of the current transformer passes through a series circuit including the trip coil, the relay coil and the secondary coil of the direct-trip attachment, which we will call for our explanation a voltage transformer.

When the secondary current increases in the current transformer all the equipment in series with it receives a greater current. Under these conditions the current is not sufficient to trip the circuit breaker on the line to be protected but is sufficient after a time delay, governed by the relay, to close the contacts of the relay. When these contacts close, it closes the secondary coil of our voltage transformer (direct-trip attachment) and it now being a transformer with a closed circuit on its secondary it quickly takes a heavier current in its primary, which will be noted is the secondary of the current transformer. This quick rush of increased current in the secondary circuit then becomes strong enough to operate the trip coil, which in turn trips the circuit breaker and relieves the power circuit of the overload.

ELECTRICAL ENGINEER

Speeding Up Spontaneous Combustion

AN UNUSUAL piece of apparatus has just been perfected at the Pittsburgh Experiment Station of the Bureau of Mines in connection with a study being made on the conditions favoring spontaneous combustion of coal. This apparatus permits of continuous measurements of the temperature of coal samples as they are subjected to conditions favoring spontaneous combustion. Oxygen is passed through the sample in order that it may develop heat in a much shorter time than would be required under conditions of actual storage. In this way it will be possible to determine which coals are most likely to take fire. The apparatus was designed and built by A. C. Fieldner, superintendent of the station, and J. D. Davis, chemist in charge of fuel chemistry.

Dr. Reinhardt Thiessen is engaged in a study of the constituents of coal. By isolating these constituents it will be possible to determine which of them are most prone to cause spontaneous combustion. Once the particular offenders are known it is believed that it will be comparatively easy to designate the relative susceptibility of various coals to fire.

The tests thus far conducted show that heating is comparatively slow until a temperature of 150 deg. F. is attained. From that point the curve steeply rises to the temperature where combustion begins.

THE REPORT OF SUB-COMMITTEE No. 4 of the International Mine-Rescue Standardization Committee, on the use of mine-rescue apparatus in coal mines, recommends that the minimum number of men trained at a mine be 10 per cent of the men employed at that mine, with an absolute minimum limit of 10 men. As many as possible outside men familiar with the underground workings should be included. In selecting rescue men considerable care should be used, both as to physical and mental fitness and also as to experience in and familiarity with the underground workings.

Problems of Operating Men

Posting the Face of the Coal in Driving Rooms

Danger When Working Under Drawslate—
Reluctance of Miners to Set Needed Posts—
Posting the Coal Face in Machine Mining

SAFE timbering of mines, particularly that of the coal face when driving rooms, is of such importance that volumes might be written on the subject. However, giving heed to one or two recognized facts in timbering will prove more effective in the avoidance of danger than a multiplicity of rules and regulations regarding safety.

Reducing the entire subject to a principle, there is one truth that is the underlying foundation, which I would express in the following words: "One post promptly and properly set is a greater safeguard than a world of experience, in the mining of coal."

DANGER UNSUSPECTED WORKING UNDER DRAWSLATE

Perhaps one danger that is more often disregarded by the experienced miner is that to which he is exposed when working under a drawslate. Nothing is more precarious than the presence of hidden and unsuspected danger, which is commonly the situation in nine cases out of ten where the coal is overlaid with a drawslate that has every appearance of being sound.

Only recently I heard a miner tell his foreman that the drawslate beneath which he was working did not need posting. Upon the foreman's insistence that a number of posts should be set at once the miner replied, "Why man, do you suppose I've been a miner for thirty years and don't know when a place is safe?" That such is the attitude of most miners or that, in many instances, they are permitted to have their own way regardless of mine rules and regulations cannot be denied.

The point I wish chiefly to emphasize is the reluctance of a large class of experienced miners to set the timbers that they must know are needed to insure safety and give them the necessary warning of imminent danger. It is this reluctance of miners to perform the required work and their almost universal disposition to postpone the timbering of their places that is responsible for a very large percentage of accidents at the working faces in mines.

NEED OF SETTING FACE TIMBERS IN MACHINE MINING

In machine mining we face another situation equally bad and difficult to overcome, because it imposes some extra labor on the part of the miners and the machinemmen who cut the coal. Here also opinions are largely influenced by the task that a proper regard for safety imposes on all workers, who are too often willing to assume risks rather than perform what they may consider unnecessary labor.

On his visit to a certain mine, recently, a certain inspector insisted that posts be kept within six feet of the face of the coal, which was being cut with machines. Both the foreman and the machine runner claimed that they must have 14 ft. between the posts and the face of the coal. The foreman stated emphatically that a place cannot be cut if the posts are closer than 14 ft. from the face. Much time was spent in arguing the matter before the men were finally compelled to accede to the demands of the inspector.

SAFE MINING REQUIRES STRICT DISCIPLINE

Situations such as these bring to my mind forcibly what is the one greatest need in the safe mining of coal; and that is discipline in compelling compliance with the safety rules and regulations of the mine. A miner's professed experience must not exempt him from obedience to instructions; and the foreman's desire to produce coal at low cost must not disregard safety.

What can be done in this respect can be clearly seen by visiting the Pike Floyd mine, at Betsy Layne, Ky. In that mine we find each miner sets three posts close to the face before shooting his coal. Should the posts be knocked out by the shot they are promptly reset before other work is done in the place. Here the machinemmen cut more coal than the average and do it with the posts set within 6 ft. 3 in. of the face. The conclusion is that the workers in that mine make safety the first consideration.

Miners Drawing Lots for Working Places

Plan not applicable to this country—Inequalities of the system—Miners should be allowed to choose their own partners.

MY ATTENTION was recently called to the letter of William Allan entitled "Caviling System in England," *Coal Age*, Jan. 25, p. 185. The letter describes a system said to have been practiced in the north of England, which I frankly admit is news to me, I not having heard of it previous to reading that letter.

Briefly described, the system is one in which the miners were compelled to draw lots for their working places, at the beginning of each three-month period. Whether the place was good or bad the miner had to submit to his lot and continue to work the place for the next three months, hoping all the time that he might draw a better place the next quarter.

To say the least the plan is a unique one; but, in my opinion, it would not prove satisfactory in this country. In his letter, Mr. Allan claims that it insured a square deal for all the miners and was profitable for the operator. Regarding the latter statement, there can be little doubt that the operator would profit by the system, as he would not have to worry about the working of the poorer places in his mine.

Compelling a miner to work a bad place where, for three months, he can only earn a bare existence, while other miners close by have good places in which they make double the amount of wages with less labor, does not appeal to me as "a square deal" or one that could be put in practice here with any assurance of success.

In every mine there are hard places that must be worked; but, in all fairness and justice, the miner should be paid for his extra labor, so that he will be able to earn equal wages with those who are given better places. It is no fault of the miner that the coal in his place is thin, or there are boulders in his path, or the nature of the roof requires special timbering. These are burdens that fall to the lot of the operator on whose shoulders they should rest.

"STRANGERS' HOME" AND "CORN-BREAD ENTRIES"

In my own experience as a miner, roof conditions and the thickness and hardness of the coal would change frequently and sometimes very suddenly. Speaking in mining parlance, mines where these hindrances predominate have their "Stranger's homes," their "Corn-bread entries," and the like, because of the natural difficulties in the earning of a good living in such places. It goes without saying that such mines have few steady miners but subsist on a floating population.

In order to appreciate the inequalities of mining coal under a system that takes no account of differences in working conditions, we have only to recall that, but a few years ago, the price paid the miner for digging coal was the same regardless of the kind of coal or other conditions under which he must work. The man digging coal three feet thick, on the side of a steep rock and under a bad top, received no more pay, per ton of coal mined, than the man working where the coal was six feet thick and level, with a good roof above the seam that required no particular attention.

Since then it has come to be recognized that there is nothing square in such dealing. A scale of prices has now been established for different thickness of coal, and allowances are made for bad roof and other unfavorable conditions. The result is that the miner working a bad place is now able to earn about as much money as the men in a good place. The foreman, of course, is compelled to use good judgment, in order to get the coal mined at the least expense, and encourage the men working the poorer places, by promises of a better place when that is finished.

ADVANTAGE IN MINERS CHOOSING THEIR PARTNERS

A more promising feature, however of the caviling system mentioned by Mr. Allan is the privilege afforded every miner of choosing his own partner. This reminds me of an incident that came under my observation several years ago. At that time jobs could not be picked up every day, at coal mines, as there were more men than places in which they might work. The result was that the majority of the miners were slow about quitting their places.

The incident I have in mind related to two miners who were put to work in the same place, the one being an old man and the other much younger. Both men were selfish and each wanted to boss the place. Naturally, it was not long before they were at outs with each other. Not being able to give them separate places, the foreman divided the room, giving one man the right and the other the left side of the breast, with the track between them.

Each man did his own shooting and timbering, but they both used the same powder keg and loaded their cars together. It is not strange that when a shot of one or the other proved bad there was much growling and the chances of dispute between the men were numerous. Today, however, miners are given more privileges and consideration in the choosing of the working partners. As Mr. Allan has suggested, working alongside of a man with whom you are not on friendly terms is a disagreeable experience.

Crumb Coke

Experience of a consumer in burning what was bought and paid for as "coke" but needs to masquerade under a title more closely descriptive of its real character.

BEING a mechanical engineer and professing to know a little about the combustion of coal, I sent some instructions recently to a near friend, whom I knew was having trouble in his plant, owing to the scarcity of coal. In reply, he came back with the following, which may be of interest by way of amusement:

"Thanks for your advice as to how to save coal. You may be able to tell me how to get the coal, as I am using something that was bought and paid for as "coke." It reminds me of an article, headed "Grudekoks," (*Coal Age*, Vol. 23, p. 175) I read some time ago. The term described a new fuel and meant "Embers coke."

Did you ever see soft "Crumb Coke?" No? Well, you are not a high-class M.E. until you have handled and tried to burn that article. It has a wonderful odor while burning; forms a crust like the top of a volcano and keeps the heat securely locked beneath.

When all that was combustible has finally been consumed and fallen through the grate as ash and there is nothing to support the crust it settles down on the bars in the shape of what our stokers call "grate joy killers," otherwise, "klinkers." In my opinion, they well deserve the name first given."

This letter of my friend probably describes the experience of many other consumers of coal.

N. G. NEAR.

Multiplying Airways in Mines

Development of simple rule for finding increase of quantity due to multiplying airways one or more times in a shaft mine.

NOT long ago there appeared in *Coal Age* a problem relating to the increase of quantity that resulted from the addition of another airway of the same size and length as the present airway. The solution assumed the power on the air remained constant and it was found that the quantity of air in circulation increased from 10,000 to 11,696 cu.ft. per min.

The first solution to this problem is found on page 1002, Vol. 22. Later, I gave a second solution, which appeared in the issue May 3, p. 722. Studying over the matter since, I have worked out a simple rule for ascertaining the increase of quantity when the number of airways in a mine is increased two, three or any number of times, assuming the power on the air remains constant. The solution also assumes that the resistance of the original airway is equal to the total resistance of the two shafts, upcast and downcast. Calling that resistance unity or one, the combined resistance

of the two shafts and the original single airway is two.

The rule is as follows assuming a constant power on the air and the resistances of the two shafts and original airway equal, multiply the original circulation by the cube root of twice the square of the number of airways in the mine, divided by the square of that number plus one.

For example, if the original circulation was 10,000 cu.ft. per min., the addition of another airway of equal size and length to the first will increase that circulation to

$$10,000 \sqrt[3]{\frac{2 \times 2^2}{2^2 + 1}} = 10,000 \sqrt[3]{\frac{8}{5}} = 11,696 \text{ cu.ft.}$$

Again multiplying the number of airways in the mine three times, gives for the quantity of air circulated by the same power

$$10,000 \sqrt[3]{\frac{2 \times 3^2}{3^2 + 1}} = 10,000 \sqrt[3]{\frac{18}{10}} = 12,164 \text{ cu.ft.}$$

HOW THE RULE IS DEVELOPED

The rule I have mentioned is found by first assuming the quantity of air constant and calling the power absorbed in passing that quantity through the two shafts unity or one, the total power absorbed in the two shafts and the single airway is then 2. But, since the power varies directly as the rubbing surface and inversely as the cube of the sectional area, or as n/n^3 , or $1/n^2$, n being the number of airways in any case, the power absorbed by the two shafts and n airways is $1 + 1/n^2$, or $(n^2 + 1)/n^2$. Then, finally, increasing this power to the original amount, remembering that the quantity of air varies as the cube root of the power, gives the proportion

$$\sqrt[3]{\frac{n^2 + 1}{n^2}} : \sqrt[3]{2} :: Q : x = Q \sqrt[3]{\frac{2n^2}{n^2 + 1}}$$

In this proportion, Q is the original quantity passing in the two shafts and single airway, n the number of airways and x the quantity circulated in n airways, under the original power.

Retimbering a Shaft Bottom

Decaying and broken timbers overlaid with loose material presented a dangerous condition—Heavy jacks used to force new timbers into position.

READING an article that appeared not long ago, in *Coal Age*, concerning the replacing of old timbers having 15 ft. of loose slate lying above them, recalled a similar experience in my own practice. The condition is one that mine foremen are often compelled to face and calls for the exercise of their best judgment and skill in performing their work.

The instance I have in mind occurred when accepting a position as foreman at an old mine, which had fallen into a condition that would require much labor and time to restore, before active work could be again resumed. On taking charge of the mine, I immediately found that it would be necessary to retimber the shaft bottom.

Starting from the shaft and extending back for a distance of about 75 ft., the old timbers had begun to decay and many of them were breaking under the load of loose material above them. The prospect was a dangerous one.

After making a short survey of the situation, I ordered a sufficient number of 12x12 in. timbers, 15 ft. long, to enable me to make a good substantial job. I

then secured from the section hands on the railroad, two heavy pump jacks. These, together with a good stout timber cut to a suitable length. I intended to use for the purpose of forcing the new collars or crossbeams into position.

When this material was on hand and everything ready the work was started at the shaft. A new collar was brought and raised to the roof where it was supported on two temporary legs. The position of this timber was midway between two of the old timbers. The two jacks were then brought into requisition and, by their use, the new collar was forced up to a firm position against the old overhead lagging that was still in fair condition.

When this timber had been forced up as far as it would go and made level, measurement was taken for the permanent legs. After these had been finished and stood in place the jacks were released and the collar beam allowed to settle on the two legs. In the same manner, other timber sets were placed in position, one after another, until the entire job was completed. Later, the old broken timbers were taken down and removed from the mine. I thought this brief account might be of some assistance to others in a similar situation.

Hillside, Ky.

O. KENNETT.

Inquiries Of General Interest

Available Tonnage Underlying a Coal Property

Estimated Tonnage Based on Percentage of
Extraction and Allowance for Screenings—These
Factors Vary and Must Be Taken Into Account

CONTEMPLATING the leasing of a large coal tract consisting of 1,110 acres, it became desirable to form a fairly close estimate as to the amount of available coal underlying the tract. The record of the prospecting has showed the presence of three seams of coal above the drainage level and three other seams lying below that level. The former have a thickness of 3 ft., 5 ft. and 4 ft., respectively, while the three lower seams each have an average thickness of 5 ft.

Two parties have made widely varying estimates as to the amount of coal underlying this tract and available for extraction. For example, A reports an available tonnage of 47,952,000 tons, while B's estimate is much lower, his report showing an approximate amount that he says will not exceed 35,864,000 tons. It would be interesting to know which of these estimates is more nearly correct.

Before closing the deal for the leasing of this tract, which we have held back awaiting reliable estimates on the probable available coal, we are desirous of ascertaining as nearly as practicable what is the reason for the extreme divergence in the figures that have been given as stated above.

_____, W. Va.

MANAGER.

Estimates on the available tonnage underlying a coal tract will vary according to the assumed basis of figures.

Taking the average specific gravity of bituminous coal as, say 1.3 and its weight $1.3 \times 62.5 = 81.25$ lb. per cu.ft., makes the weight of coal in place, per foot-acre.

$(43,560 \times 81.25) \div 2,000 = 1,770$, say 1,800 tons.

In estimating the available tonnage, or the weight of coal that can be mined and marketed, it is necessary to assume a probable or possible percentage of extraction. This will vary from 80 to 90 per cent or more depending on the method of working and the style of equipment. For example, assuming a 90 per cent extraction and a mine-run basis of shipment, would make the

available tonnage from 1,110 acres underlaid with these six seams aggregating a total thickness of 27 ft.

$0.90(1,800 \times 27 \times 1,110) = 48,551,400$ tons.

Again, assuming an 80 per cent extraction of coal and making an allowance of 16-2/3 per cent for screenings, the weight of lump coal available for shipment would be

$0.80(1,800 \times 27 \times 1,110) 5/6 = 35,964,000$ tons.

Finally, we would say that the first of these two estimates represents the basis of A's figures, while the second is probably the basis of B's estimate.

(Selected Questions)

QUESTION—*In an airway 8 ft. wide and 6 ft. high, the air has a velocity of 240 ft. per min. What is the volume of air passing per minute?*

ANSWER—The sectional area of this airway is $6 \times 8 = 48$ sq.ft. Assuming the given velocity is an average for the airway, the quantity of air in circulation is $240 \times 48 = 11,520$ cu.ft. per minute.

QUESTION—*Do you favor mixed lights in a mine where explosive gases are generated? Give full reasons.*

ANSWER—No. In a mine generating explosive gas in quantities requiring the use of safety lamps, none but such lamps should be used. In other words, the mine should be worked exclusively with safety lamps. If open lights are allowed in certain parts of a mine generating gas in quantities that require the use of safety lamps in other sections of the mine, there is always the possibility that a man carrying an open light on his head will enter a section where safety lamps are required. He will do this thoughtlessly and without having any wrong intentions, but the consequences are the same. Again, a fall of roof, occurring in the section where gas is generated, may drive the gas out into other parts of the mine where open lights are in use and it will be ignited before the men have any warning of their danger.

QUESTION—*What are the advantages obtained from having safety lamps shielded?*

ANSWER—Safety lamps are shielded in order to protect the flame from a strong draft striking the lamp, or from a sudden concussion of the air, which might force the flame through the wire gauze and ignite the gas-charged air surrounding the lamp. It often happens that a safety lamp is swung to and fro by a man when walking and is thus subjected to a greater pressure than is safe. The shielding of the lamp reduces this danger.

QUESTION—*What precautions should be taken in the use of safety lamps in gaseous mines?*

ANSWER—In the first place, none but approved types of safety lamps should be used. These lamps should be owned by the company and kept in separate lockers or pigeonholes, or hung on individual hooks in a lamp-

house. A competent and reliable person should be given charge of the lamproom, and all lamps should be thoroughly cleaned, examined and filled when delivered there at the close of each shift. Every man's lamp should be numbered to correspond with the check that is given him in return for his lamp. The lamp, after being cleaned, filled and examined, should then be hung on a hook or placed in a pigeonhole numbered to correspond with the number on the lamp. In the morning, each man receives his lamp, it having been first lighted and properly assembled. The man's check is hung on the hook or put in the pigeonhole from which this lamp was taken. When this plan is followed, it furnishes a good record of what men are in the mine and who has not reported for work.

QUESTION—*How long would you allow a safety lamp to remain in an explosive mixture of gas?*

ANSWER—No safety lamp should be exposed to a fire-damp mixture after the presence and character of the gas has been made known by the appearance and action of the flame within the lamp. Immediately on the observance of a flame cap and estimating its height the lamp should be cautiously withdrawn from the gas, avoiding any sudden or quick movement that might force the flame through the gauze and ignite the gas surrounding the lamp.

QUESTION—*When and where must danger signals be placed, in a gaseous mine, to comply with the Alabama Mining Law?*

ANSWER—The law (Sec. 32) requires the fireboss, "after each examination, to leave, at a point at least 25 ft. distant from the face of every slope, drift, entry or air-course and at the neck of every room examined by him, a conspicuous sign or mark indicating the presence of gas in dangerous quantities discovered by him, together with a memorandum of the date of his examination." Sec. 41 of the law also requires that the entrance or entrances to worked-out and abandoned places containing an accumulation of explosive gas shall be properly fenced off and cautionary notices posted on said fencing to warn persons of the danger therein.

QUESTION—*Why is it that marsh gas (CH_4) is generally found lodged near the roof and carbon dioxide near the floor?*

ANSWER—Marsh gas or methane has a specific gravity of 0.559, which makes it only slightly more than one-half as heavy as air of the same temperature and pressure. On the other hand, carbon dioxide has a specific gravity of 1.529, which makes it more than half again as heavy as air, at the same temperature and pressure. Therefore, methane being lighter than air tends to rise and accumulate at the roof, in mine workings, while carbon dioxide being heavier than air, tends to fall and settle at the floor, or in other low places, unless something prevents.

Buy Supplemental Fuels Now, Says Commissioner Smith; Rush for Hard Coal Would Boost Prices

BY PAUL WOOTON
Washington Correspondent of *Coal Age*

NOTE—The following article was written before the anthracite wage negotiations were suspended. When the action of the conferees became known a member of the Coal Commission was acquainted with the contents of this article. He stated that while the termination of the conference may be regarded as adding somewhat to the possibility of an ultimate failure in the negotiations, there is no reason to revise the opinions held before the conference broke up and which are reflected herein.

The Coal Commission apparently is taking it for granted that there will be no failure on the part of the anthracite operators and mine workers to reach an agreement. The members of the Commission returned to Washington last week after a few days' breathing spell, and began to concentrate their entire attention on the bituminous situation. While the comment of members of the Commission indicates that they are watching the anthracite situation closely, it is evident that they are not greatly disturbed by the maneuvering in progress at Atlantic City and Scranton. Chairman Hammond admitted at the press conference July 27 that the discussions are passing through the stereotyped stages of all such negotiations. The necessary preliminary sparring is following the usual course, but Mr. Hammond expressed the belief that the contestants are warming up to the point where they are ready to take off the gloves and go to it with bare fists in real earnest, with the prospects favoring a prompt decision.

ASKS FAITH IN INDUSTRY'S RESPONSIBILITY

In its attitude toward the anthracite negotiations it is apparent that the Commission is living up to the policy outlined in its own report. It is throwing the responsibility on the men in the industry. It has called upon the country to have faith in their ability to conduct their own industry in the public interest, and it is evident that the Commission's faith in the ability of these men to work out their own problems has not been shaken. If by any chance the time should arrive when there should be serious doubt as to their ability to agree it is probable that the Commission would do as it did during the bituminous negotiations, and exert its full influence to insist upon an agreement. In fact, Chairman Hammond stated at Friday's conference that the Commission would reiterate its appeal should the occasion arise and in the interest of the public would make that appeal just as strong as possible. He emphasized, however, that there is no thought of taking such a step yet.

While members of the Commission regard it as entirely natural that New England should be worrying over its winter fuel supply, the opinion seems to be that there is nothing to justify the degree of alarm which seems to have pervaded those states. In New England, at least, it was suggested, the interest is centering on the check which must be given the coal dealer rather than on the check-off. The inference intended was that the price of anthracite had reached the point in New England where a considerable proportion of the population cannot afford to pay it. They are not so much interested in the technical differences which are being discussed at Atlantic City as they are in seeing a reduction from \$16 or \$18 per 2,000-lb. ton which they now are being called upon to pay.

Attention was called at the conference to the almost unanimous editorial support which has been given the Commission's position that anthracite is "affected by a public interest." The comment made in that connection led to the warning that a different situation exists with regard to bituminous coal. In contrast with the natural monopoly in anthracite, attention was called to the fact that outside of New England every state either has coal within its boundaries or is contiguous to a coal-producing state. The Commission is rather proud of the fact that three of its suggestions were acted on immediately. The Interstate

Commerce Commission ordered the investigation of anthracite freight rates. The 12-hour shift is to be abolished and a continuing umpire is to sit with the Conciliation Board. Many persons in communications sent direct to the Commission express their opinions of the report. Up to this time a more or less equal division has been maintained between those who think the report too radical and those who think it too conservative.

At least one member of the Commission, Dr. George Otis Smith, believes that little is to be gained by urging householders to buy anthracite at this time. The possibility of a strike has stimulated buying to the point where it is increasing price levels materially. Any rush to buy domestic sizes of anthracite at this time simply would push the price higher. It is sounder advice, he believes, to buy supplemental fuels at this time. These substitutes can be purchased now at the lowest prices which have been obtainable this year. If there should be a strike on Sept. 1, these substitutes would have to be purchased at an advanced price. If there is no strike, it apparently is Dr. Smith's thought that anthracite retail prices would be likely to recede. A two-months supply of coke, briquets, buckwheat anthracite or soft coal would be worth the investment by way of insurance, to say nothing of the possible saving which would be made in the purchase of domestic sizes during a time when there is no semblance of a buying panic.

Chairman Hammond fully expects Congress to provide the legislation recommended in the anthracite report. He believes it is so obviously in the public interest that there will be no important opposition to it. He was asked if, in case of a deadlock, the President were to take over the mines under emergency power, the mine workers would be any more likely to return to work at the request of the President than they would at the request of the private operators? Mr. Hammond, in reply, expressed the opinion that the probabilities of their return would be increased, but even if they were not, such action on the part of the government would bring to bear on the situation the full weight of public opinion, which would be likely to get results.

The Coal Commission had planned to issue this week a report on civil liberties, but on Monday the bituminous operators announced to the Commission their intention of filing a special brief on the West Virginia situation. At their request the Commission is withholding the report until the brief can be received and examined.

Brydon Names Policy Committee of 25 To Continue Study of Coal Problems

John C. Brydon, president of the National Coal Association, on Aug. 1, named twenty-five of the country's foremost operators of bituminous-coal mines as members of a committee whose purpose it shall be to continue the study of problems confronting the industry, to pass on questions of policy affecting the association and to form a closer liaison between the mine owners and the public.

This committee is to be known as the Policy Committee of the association, a new body formed as the result of a suggestion embodied in the inaugural address of Mr. Brydon when he was elected president of the organization at its recent annual meeting in Atlantic City. In selecting its members the association's president chose not only with a view to giving the industry adequate geographical representation but the personnel is equally divided among owners of mines employing union labor and those conducted under the open-shop system. By virtue of his office Mr. Brydon will be chairman of the committee.

"We must organize to put ourselves regularly and con-

tinuously into closer contact with the public's interest and the public's mind," Mr. Brydon declared. "In my opinion," he continued, "the action taken by the membership of the National Coal Association in authorizing the appointment of a Policy Committee, is the most advanced step we have taken. It means that the members of the association have recognized and are ready voluntarily to assume the obligations which belong to a great industry.

"The membership of the Policy Committee is not confined to the National Coal Association," Mr. Brydon explained. "In making up the committee, counsel and advice have been sought beyond as well as within the association. This has resulted in a committee membership which is truly representative of the industry as a whole.

"For example, the entire membership of the Bituminous Operators' Special Committee, which was not confined to the association, is included in the Policy Committee. The Special Committee has for some months been making a careful exhaustive and intensive study of the soft-coal industry in co-operation with the U. S. Coal Commission. The Policy Committee will benefit by the inclusion of all Special Committee members, who, because of their activities in the investigation now in progress, are among the best informed men on the general situation of the bituminous industry.

"I am confident that the work of the Policy Committee of the National Coal Association will be an important factor in producing results both for the public and the industry itself."

Hoover's Book on Trade Associations Wins Attention in Coal Industry

There is a widely held belief throughout the country that the exhaustive study of trade associations just completed by the Department of Commerce and the publication of the department's book on the subject—"Trade Association Activities"—is going to do much to establish effective associations within the coal industry. The book was issued July 16. It is now in demand and is getting studios attention throughout the industry. Expressions from coal men indicate that they think the book is not only helpful, being the first comprehensive work on the subject, but that its aim is right and that it may unify the several confusing governmental attitudes toward trade associations.

The book comprises an introduction by Secretary Hoover, chapters compiled from the experience of many on statistics, legislative activities, cost accounting, credits, trade disputes and ethics, employee relations, insurance, public relations, traffic, research, and other phases of trade association work, together with a study of association organization, a history of associations and a directory of national and international associations. Altogether it is a 368-page volume that attempts to cover the whole subject, but, as the editors of it say: "Manifestly it has been impossible to collect the matured views of all those qualified by knowledge and experience to give worth-while information," so they will welcome criticisms and suggestions that may make future editions of the book more valuable.

In his introduction, Mr. Hoover, recognizing that the public has gained a warped idea of associations because of "the minority of activities which have been used as a cloak for action against the public interest," declares the business of this country needs the constructive work that associations can best do and that therefore the public should get a clearer and truer idea of associations. The book was published, he says, not to educate big business but to show that legitimate trade associations and other forms of business co-operation are the real basis for promotion of small businesses. Mr. Hoover declares the proper collection and dissemination of business statistics benefits both the producer and consumer and is so necessary to the orderly economic life of the country that statistical services must be maintained either by associations or by the government. All the way through his introduction Mr. Hoover makes it plain that legitimate trade associations are essential and the book outlines, chapter by chapter, what legitimate associations can do.

The chapter on the legal aspects of the trade association situation is of particular interest since it comes from Nelson B. Gaskill, of the Federal Trade Commission. It has been assumed that the Federal Trade Commission is not particularly friendly to the movement.

In his chapter Mr. Gaskill says, among other things: "The trade association is not a combination in restraint of trade with one hand tied. It is not a medium for the exchange of business secrets for the sole benefit of those who join in the exchange. It is not a new arrangement for the accomplishment of any object which needs, because of the law, to be pursued stealthily and in the dark. It is an expression of an interest, common to all in any industry in which it arises, seeking to benefit the individual by bettering the entire industry and the public which the industry serves.

"It serves where the individual acts. It instructs where the individual learns. It works for the individual, but never instead of him. And while the attention of the individual may be focused on himself and his own interest, the aims, objects and ideals of the trade association are fixed in the wider field of the welfare of the whole group, the whole industry and the whole public dependent upon it." Mr. Gaskill concludes, however, with the admonition that the trade association must "hitch its wagon to a star."

Kansas Fails to Get a Machine Scale

The latest effort to get a machine mining scale for Kansas has failed. Conferences between the Southwestern Interstate Coal Operators' Association and the United Mine Workers of District 14 in Kansas City at intervals since last March 19 were broken off June 20 at a final session which lasted three days. A gap of 5c. divided the operators and miners when negotiations ceased. The operators, who had at first proposed that the machine scale be 15c. a ton less than the \$1.25 paid for digging, later offered an 11c. differential, but the miners' union would make no concession from its demand that the differential be only 6c.

A statement issued by the operators' association at the termination of negotiations said that machine equipment for each mine would cost \$12,000 to \$15,000; that the saving in powder purchases by the miners and lightening of the work would have justified a 15c. differential and that the 11c. differential would not fully cover the investment, installation and maintenance, and that therefore a still lower differential as demanded by the miners could not be considered.

The operators' statement, issued by W. L. A. Johnson, general commissioner, said: "It is very regrettable that the miners saw fit to break off negotiations, as it withdraws the ray of hope that the Kansas mining field would be given an opportunity to recover much of its lost market by being able to offer a larger volume of prepared lump coal at reduced cost, which would have enabled some reduction in prices and the maintenance of its market and the extension of the same to a wider field, thus enabling the miner to make greater earnings and have steadier work instead of having 200 or 300 'no-bill' cars on the track and only one to three days' working time a week."

An offer of the operators to arbitrate the differential with a representative of the international board of the United Mine Workers or a committee from that body was refused by the union conferees.

Cutting machines of various kinds have been used experimentally in the Southwest for about a year in the hope that by this time a scale would be worked out, so that by next fall the entire field could be on a machine basis. Several of these have been uniformly successful. In the Cherokee region even in an upper vein only 20 to 24 ins. thick a number of machines have been worked by operators who received the union day scale of \$7.50. Near Pleasanton approximately 15 machines have been working on a combination tonnage and day rate.

In the whole of District 14 the coal has been shot so hard that slack has averaged between 50 and 55 per cent of the total output. This naturally has been a tremendous handicap to the operators. Their hope has been to reduce the slack percentage to at least 40 and be able to produce cleaner coal with much less powder after cutters were installed.

Anthracite Wage Conference Breaks Up When Operators Balk at Granting "Check Off"

Refusal of the anthracite mine operators to grant the demand of the mine workers' leaders for the "check off" broke up the wage conferences at Atlantic City on July 27. The conference was nearly disrupted the day previous when John L. Lewis demanded that the operators grant demand No. 1, which covers complete recognition of the union and the "check off" as a condition of continuing the conferences. Part of two sessions had been devoted to a discussion of the demand when Mr. Lewis presented a motion "that the principle of complete recognition and the check off as explained in demand No. 1 be adopted." The operators voted "No" and the miners "Aye," S. D. Warriner, chairman of the sub-scale committee, declaring the motion lost.

Mr. Lewis said the miners insisted upon this demand and an adjournment was taken until the following day.

Before final adjournment was taken on July 27, Mr. Warriner read a statement setting forth the position of the operators and making an offer to submit the questions at issue to arbitration. This was refused by the miners.

AGREEMENT CONTINGENT ON UNION RECOGNITION

At the conclusion of the conference on July 26 Mr. Lewis said that the making of a new anthracite working agreement is contingent upon the anthracite operators giving full recognition to the United Mine Workers of America.

"Such relationship has existed for a quarter of a century in the bituminous coal fields," said Mr. Lewis, "and the miners are within their rights in asking recognition from the anthracite operators. This demand for recognition will not add a single penny to the cost of the anthracite product, and concession on this point is essential to carry out the recommendations of the U. S. Coal Commission in the matter of penalties for breach of contract. The mine workers are consistent on this point and will continue in that attitude."

S. D. Warriner, replying for the operators, said that they do and have fully recognized the union as a contracting party in accordance with the provisions laid down in the Roosevelt award in 1903 and the award of President Wilson's commission in 1920.

Continuing he said, "Their officers and agents are recognized people with whom we do business and confer to settle disputes and grievances relative to labor matters in the anthracite region.

"This agreement to which the union has heretofore subscribed, has been on the open shop basis, under which anyone can work in the anthracite field in accordance with his constitutional rights so to do. If he elects to become a member of the union he is protected against any discrimination by any employer.

"The operator insisted upon by Mr. Lewis is on the closed-shop proposition, under which no one can work in the anthracite fields unless he is a member of the organization, thereby depriving anybody who may not so elect of his constitutional rights to earn his living at his chosen vocation.

"The operator also is to be compelled to collect from every man working in the anthracite industry, exclusive of clerical and managerial occupations, such fines, dues and assessments as the union may dictate.

"The U. S. Coal Commission of 1923 is very clear on this matter when it says: 'The principle that a man has the legal right to work free and unimpeded by threats, duress, coercion or restraint, when, where and for whomsoever he chooses; that a man has a legal right to employ and discharge as he pleases, and that men have a right to bind themselves together for collective bargaining, touching wages and working conditions, are freely admitted by every one. These principles honestly lived up to would keep the open shop and at the same time permit the existence of the union.'

"To all intents and purposes the agreement under which we are operating is in accordance with these principles."

When the conference was resumed on July 27 Mr. Warriner, after Mr. Lewis had declared that the miners still insisted upon demand No. 1, read into the record a statement setting forth the attitude of the operators, and concluding with an order to arbitrate. Mr. Lewis in replying to Mr. Warriner stated that negotiations could not go on until concession had been made on the matter of the recognition of the union and the installation of the check off. Mr. Warriner's statement read in part:

"You make a condition of further negotiation the acceptance by the operators of your first demand—complete recognition of the United Mine Workers of America, which you very frankly tell us implies the closed shop and the check off. In a word, you say to us that unless we are willing to make membership in your organization a condition of employment, and unless we are willing to collect from the pay envelopes of our employees union dues, assessments and fines arbitrarily levied upon your members, and turn the moneys over to the treasurer of your organization, you must refuse further consideration of a contract to take effect after the expiration of the present contract on Aug. 31.

"As far as the recognition of your organization is concerned, you have such recognition now, for the present contract is with the United Mine Workers of America.

"The demand for a closed shop has twice been a subject of arbitration between us—first before the Roosevelt commission in 1902, and second before the Wilson commission of 1920.

UNION SUBORDINATE TO LAWS OF NATION

"Both of these commissions refused your demands in no uncertain terms and declared unequivocally for the open shop. You seem to ignore entirely the admonition of the Roosevelt commission that 'the trade union is a voluntary social organization and like any other organization is subordinate to the laws of the land and cannot make rules or regulations in contravention thereof. Yet at times it seeks to set itself up as a separate and distinct governing agency and to control those who have refused to join its ranks and to consent to its government, and to deny to them the personal liberties which are guaranteed to every citizen by the Constitution and the laws of the land.'

"In the final analysis nothing could express our view more clearly than the quotation just given.

"It is to be regretted that your position prevents further negotiation and the working out of a new contract by the orderly process of collective bargaining. Therefore, I would like to state definitely the position of the operators.

"We have listened to the arguments you have presented covering the demand just refused, the demand for a general increase in wages, and the other demands, which in the main were a repetition of demands before the Wilson commission in 1920. The industry is operating under a scale of wages which represents the very peak of post-war conditions. The employees in our industry have not suffered a wage reduction and wages today are far above the increase in the cost of living as compared to the pre-war period. The report of the U. S. Coal Commission, just issued, indicates most clearly adequate earnings to permit the essential so far as reasonable standard of living.

"In the light of these conditions we are prepared to execute a contract renewing the present wage scale to April 1, 1925. We will eliminate the twelve-hour day where it is in effect, speed up the work of the Board of Conciliation, and endeavor to embody in the contract clauses covering those minor matters which we have expressed a willingness to consider during the present negotiations."

Mr. Lewis replied extemporaneously at some length to Mr. Warriner's statement, charging it "obviously was prepared for the press, for public consumption."

He declared the quotation from the Roosevelt commission's award was "utterly unfair and unjust," saying the union was "a legal and an American organization recog-

nizing the majesty of the law and the sovereignty of our Republic, and there is no conflict in principle or in fact between any of our demands and the laws of our country or the public welfare."

In demanding "complete recognition" Mr. Lewis said the anthracite men were only asking for that form of human relationship which had obtained in the bituminous industry for twenty-five years. They wanted only a contract with the operators that would be "a formal and complete recognition of the mutual responsibilities by both parties thereto." Continuing, he said:

"The operators' attempt to base their refusal upon the abstract theories enunciated in the report of the commission in 1903 is merely a subterfuge to enable them to evade their responsibilities. The world is not governed by the hoary traditions of the past and the mining industry is no longer bound by the conditions of two decades ago.

"The opinions of men of twenty years ago, of no particular experience in the mining industry, when the trade relationship between the operators and the miners had been of brief duration, are of no particular consequence today. It does not follow that their judgment must forever prevail, despite the onward progress of the world and the changing conditions of the twentieth century."

At the session on July 25 an agreement was reached on demand No. 10, in which the miners asked that mine committees and company officials be authorized to agree upon wage rates for new work and file these rates with the Board of Conciliation.

Bituminous Operators' Committee Attacks Check Off as Inimical to Industry

In a statement issued at Atlantic City, Saturday July 28, the Special Committee of Bituminous Coal Operators challenged the statement of the United Mine Workers that the "check off" has been found a satisfactory arrangement by the soft coal operators. The committee was in session there preparatory to meeting the Coal Commission in Washington on Monday, July 30. The statement follows:

"The anthracite conference has broken down on the insistence of the United Mine Workers for the check off. Mr. Lewis proposes to cut off the supply of anthracite coal to the public on the single issue that the operators will not consent to collect forcibly for his organization dues and assessments from every mine worker in the anthracite fields. That is what the check off means. He appeals to the public for justification of his position on the ground that the check off is a regular feature of the union contract and has worked to the satisfaction of everybody in the bituminous fields.

"No statement could be farther from the truth. On the contrary, the check off has proved so inimical to the steady and peaceful production of bituminous coal that the Bituminous Operators' Special Committee has filed a formal request with the U. S. Coal Commission for the complete abolition of the system.

"The check off is contrary both to the principles of Americanism and of unionism. Under it the central power of the United Mine Workers at Indianapolis is able to wring payment from every worker in the unionized fields, whether he wants to pay or not, for purposes of which he never had a chance to express an opinion and of which he may entirely disapprove. It is taxation without representation, the most un-American system conceivable.

"So far as unionism is concerned the check-off is used in practically no other union American industry. It is a unique weapon of enforced taxation, and insisted on by the United Mine Workers alone. The great self-respecting unions of the country are able to command sufficient confidence among their members to collect their own dues without this artificial means. Even among the miners of Great Britain, who have been unionized for generations, the check off does not exist and would not be tolerated for a moment.

"Collections of dues and assessments for the United Mine Workers' organization by the operators is no part of 'recognition' of the union. No unions could be more fully 'recognized' than the great railroad unions in this country and

the mine workers' union in England. Neither of them has such a check-off.

"Under the check off the United Mine Workers raise every year more than seventeen million dollars. From this huge sum they paid the expenses of armed invasion of West Virginia in 1921 by 12,000 men, an invasion which had to be suppressed by federal troops. By it they recently raised \$300,000 in Illinois to defeat justice against the Herrin murderers. It feeds a fund which every man who commits an act of violence in aid of this organization throughout the country knows will be at his command to help him to escape punishment for his act.

LEGALITY OF CHECK OFF BEFORE COURTS

"The check off is now under attack in the federal courts on the ground of the illegality of the use to which it is being put.

"This system was originally accepted in the bituminous industry in the hope that it would tend to lessen strife and breaches of agreement. The result has been just the opposite. Strife and breaches of agreement have very greatly increased throughout all the unionized fields since the check off was adopted.

"So long as the leaders of the United Mine Workers can command the use of this method of acquired, irresistible power against the community and justice, it is not surprising that they should refuse to submit the controversy to the peaceful solution of arbitration. Their present refusal, backed by Mr. Lewis, to stand for arbitration in any form is directly connected with this iniquitous system.

"The experience of the bituminous industry in the check off has absolutely demonstrated the far-sightedness and wisdom of President Roosevelt's commission in 1902 and President Wilson's commission in 1920 in refusing to impose this system upon the anthracite industry."

John L. Lewis at once replied, stating:

"The statement of the so-called Special Committee of Bituminous Operators attacking the 'check-off' system prevailing throughout the bituminous industry is merely propaganda in behalf of the non-union coal operators who dominate the National Coal Association. These interests are bitterly opposed to the principle of collective bargaining. In denying the principle of collective bargaining they set aside and trample upon a recognized principle of human and industrial relationship and turn backward the clock of progress.

"The non-union members of the National Coal Association are not as bitterly opposed to the 'check off' as they would have the public believe. They daily apply the 'check-off' system in deducting from the wages of their employees moneys for payment of store bills from their swindling company stores, doctors' fees, blacksmithing, house rent, house coal, tools, fuse, mining supplies, taxes and funds for the maintenance of baseball clubs, etc.

"They prevaricate when they state that the United Mine Workers forcibly compel them to contribute to the organization. The miners only ask that the 'check off' in the anthracite region, as elsewhere, operate in behalf of members of the United Mine Workers when they file individual orders constituting a legal assignment with the coal operators for their monthly dues to be deducted."

ABOLITION OF CHECK OFF MAY MEAN STRIKE

On Monday Mr. Lewis again attacked the National Coal Association, charging that it is dominated by non-union interests who seek to destroy the union. He said that any attempt on the part of the bituminous operators to abolish the "check off" would precipitate a national coal strike and asserted that this is just what the non-union operators are seeking in order that they may have the entire coal market to themselves and charge the public high prices.

John Brydon president of the National Coal Association, took issue with Mr. Lewis, asserting that that association represents 60 per cent of the tonnage produced in the union fields and about 40 per cent in the non-union fields. He also announced that the special committee will render a full account of its expenditures to the U. S. Coal Commission and suggested that Mr. Lewis also file an account with the Coal Commission of the disbursements of money obtained by the union through the "check off."

Bituminous Operators Offer Government a Plan to Supply Nation's Fuel in Event of Anthracite Strike

The Special Committee of Bituminous Coal Operators, headed by John Brydon, president of the National Coal Association, spent Monday, July 30, in executive session with the U. S. Coal Commission. The purpose of the conference was to present to the Coal Commission the statement of suggested finding of fact on which it is hoped by the operators that agreement can be reached with the Commission, thereby limiting further efforts on the part of both to a comparatively few controverted matters.

Following the conference the operators issued two statements, one to the press and one to the Commission, transmitting formally the statement of Mr. Brydon on Saturday replying to the claim of the mine workers that the "check-off" is a satisfactory arrangement with the soft-coal operators now in process of formation by the National Coal Association to handle distribution of coal during national emergencies. He stated that this machinery can be perfected in two weeks and offered it to the government in the event that an emergency be caused by a strike in the anthracite region next month.

Mr. Brydon also offered on behalf of the bituminous-coal operators of the country to organize with the proper department of the government a plan for voluntary publicity "of the facts as to costs and earnings of the industry and the wage earnings of miners and other vital information concerning the industry; this information to be compiled and published in such a way as not to reveal to competitors the facts as to particular companies."

The entire soft-coal output of the country excepting only 40,000,000 tons was represented in person before the Com-

missioner on Monday, according to the statement issued by the operators. The missing tonnage is mined west of the Mississippi and only distance kept their representatives from attending, Mr. Brydon said. Iowa is the only field not represented. The union operators who appeared in person before the Commission included A. M. Ogle, Indiana; George B. Harrington, Illinois; Michael Gallagher, Ohio; T. W. Guthrie, B. M. Clark, Charles O'Neill, David Price, W. A. Jones, and T. E. Clarke, Pennsylvania. The non-union operators were Mr. Brydon, Pennsylvania; E. L. Greever, Virginia; E. L. Douglas, Kentucky; S. L. Yerkes, Alabama, and W. H. Cunningham, West Virginia.

Discussing proposals of the operators to the Commission, Mr. Brydon said "This emergency plan is purely voluntary, and as president of the National Coal Association, and thus representing the great majority of the bituminous operators of the United States, I give assurance that the needs of the public will be met and the operation of this emergency distribution machinery will not be open to the criticism of any department of the government. Of course, at this time emergency machinery is being set up to handle any situation, if perchance there should be a suspension in anthracite production. However, the plan is so broad in scope and so practical that it can be used to serve the government and the public under any emergency.

"Good faith in carrying out this plan will require the prices to be reasonable, and that the public may know the prices are reasonable fullest publicity will be given through a central agency of such facts as are necessary to enable the public to reach an intelligent conclusion thereon."

Blizzard Jury Disagrees and Is Discharged

After a trial lasting from June 18 until July 26 the jury in the case of William Blizzard, president of sub-district 2 of District 17, United Mine Workers, reported to Judge Sharp, of the Circuit Court of Greenbrier County, at Lewisburg, W. Va., that they were unable to agree, and were discharged. Blizzard was charged jointly with C. F. Keeney, president of District 17, and Fred Mooney, secretary of that district, with being accessory to the murder of George Munsy, a Logan County deputy sheriff in conjunction with the armed march of 1921.

As soon as the disagreement had been reported and the jury had been discharged, it was announced by Prosecuting Attorney S. M. Autin, of Greenbrier County that Blizzard would be retried.

Kansas Industrial Court Starts Coal Investigation of its Own

An investigation of contracts between the Jackson-Walker Coal & Mining Co. and firms holding leases from the company in the southeastern Kansas field has been ordered by the Kansas Industrial Court. The investigation will start Aug. 13, on a complaint filed by the Industrial Court on its own motion, charging violation of the Industrial Court law and alleged restraint of trade. It entails a possibility of prosecution under the anti-trust law, it has been announced in Topeka.

Seventeen firms with a total investment of approximately one-half million dollars and employing 1,200 miners, are made defendants with the Jackson-Walker company. These firms lease from Jackson Walker, who, in turn lease from the Cherokee & Pittsburg Coal & Mining Co., which in turn leased the coal lands from the Santa Fe R.R. when the control of coal fields by railroads was prohibited by Congress.

It is charged that the leases under which the seventeen companies operate require the sale of all coal produced by them to Jackson Walker, with the provision, however, that they may sell coal in the open market by paying Jackson Walker a royalty of 40c. a ton. Under this provision the

lessees declare, they are unable to meet prices in the open market. They also assert that during the summer the acceptances by Jackson Walker have been so meager that they have found it impossible to operate profitably.

Effective Date of Assigned-Car Order Deferred One Month to Oct. 1

So much pressure has been exerted on the Interstate Commerce Commission by the railroads and private-car owners for a rehearing on the assigned-car and private-car decision that on July 25 the Commission deferred the effective date of the order from Sept. 1 to Oct. 1. This is generally interpreted to mean that the case will be reopened although some believe that no decision has been reached on this and will not be until a number of the commissioners who are out of Washington shall have returned.

Petitions for a rehearing and argument have been filed by the Seaboard By-product, Chicago By-product, Donner-Union, and Rainey Wood Coke companies, the Cleveland Cliffs Iron Co., the Steel Co. of Canada, the Berwind-White, Westmoreland, New River and Pocohontas Consolidated and Pennsylvania Coal & Coke companies, the Pittsburgh Plate Glass Co., the Chesapeake & Ohio R.R., the United States Steel Corporation, the Public Service Electric Co. and the American Railway Association.

The Central Pennsylvania Coal Producers' Association has answered these petitions and asked that they be denied. It is understood that the National Coal Association will file a similar answer to the petition of the railroads.

THE INTERSTATE COMMERCE COMMISSION has affirmed its original findings in the case of the Hillsboro company versus the Big Four. A re-argument had been allowed in the case. In the original decision the commission held that the failure of the Big Four to make arrangements whereby the Hillsboro company would be able to avail itself of the facilities and rates of the Chicago & Eastern Illinois R.R. did not result in undue prejudice and disadvantage to the coal company. The points involved in this case are now before the Supreme Court of the United States for decision.

Production and the Market

Weekly Review

Abrupt breaking off of the wage conferences at Atlantic City on July 27 has not yet aroused consumers of hard coal to a fear they will be without fuel next winter. Producers of bituminous domestic coals, which were used to advantage by many consumers during the last shortage of hard coal, are receiving inquiries. Operators in the Broadtop district producing egg, stove and nut sizes, are sold ahead for the next few weeks. The inquiry for substitutes also has extended to coke. Quotations for independent domestic sizes of hard coal took another jump last week, some of the smaller operators and shippers quoting from \$12.75 to \$13.00 for egg, stove and nut coals, concessions being made when a proportionate share of the smaller sizes or bituminous coal is taken.

Consumers of bituminous coal are being urged by producers to heed the warnings issued from Washington to put in coal in anticipation of autumn and winter requirements. This has resulted in additional inquiry and some actual orders, although the improvement is scarcely noticeable. A survey of storage piles at industrial plants in various sections of the East shows that stocks are fairly good, with some concerns adding to the supplies already on hand.

RESERVE STOCKS PROBABLY GROWING

Output of bituminous coal continues at an average of about 10,750,000 net tons weekly and while the tabulated returns of a canvass of reserve storage piles as of July 1 has not been completed, the Geological Survey says it seems evident that unless the rate of consumption increased greatly in June, production was sufficient to permit appreciable additions to the 40,000,000 net tons on hand as of June 1.

For three weeks the price of soft coal has remained almost stationary. Coal Age Index dropped one point on July 30 to 197, corresponding to an average price of \$2.37 f.o.b. mines. Declines occurred in Springfield

and southern Illinois, western Kentucky, Hocking, eastern Ohio and Pocahontas coals with increases in eastern Kentucky and Kanawha.

There are faint signs in the Middle West that the end of the summer slump is approaching. The better feeling followed a pick up in buying of domestic coals in the Northwest. Consumption in New England is much less than expected, and some large consumers are endeavoring to hold off contract shipments. There is some anxiety over the possibility of a suspension of mining in the anthracite fields, but the public does not act favor-

LAKE COAL DUMPED

(Net Tons)

	Week Ended July 30	Season to July 30
Cargo	1,067,202	12,885,151
Fuel	55,027	644,429
Total	1,122,249	13,529,580

ably on the suggestion that they use substitutes for the hard coals.

Export demand is quiet. There were few inquiries during the week according to New York houses those that were received coming from Italy and Holland. At Baltimore there was a drop in shipments to European countries, but an increase in movement to Canada.

Estimates of Production

(Net Tons)

BITUMINOUS

	1922	1923

COKE

July 14 (b).....	100,000	376,000
July 21 (a).....	104,000	360,000
Calendar year.....	3,515,000	11,182,000

(a) Subject to revision. (b) Revised from last report

During the first three weeks in July twenty-three ships leaving Baltimore carried in cargo and bunkers 195,586 tons of coal, while for the corresponding period of June thirty-one ships leaving the same port carried 222,012 tons of coal in cargo and bunkers.

Dumpings of coals for all accounts at Hampton Roads during the week ended July 26 were 392,249 net tons, as compared with 357,979 net tons the previous week.

With orders increasing and many miners in the smaller operations taking "vacations" some independent producers of anthracite are refusing to book additional orders at this time. Complaints of curtailed production are heard in some of the smaller mines, due to scarcity of labor on account of the vacation period and the subsequent inability of the operators to fill outstanding orders.

Midwest Is Hopeful Now

Signs marking the approaching end of the summer slump in coal are appearing faintly here and there throughout the Midwest region. They come mostly from the Northwest,

which is beginning to buy a little more domestic. However, even this small upturn has had little effect upon the down-right summer slump. No other activity worth the name has developed either in the domestic or industrial trade. Southern Illinois screenings, even though about cleaned up, do not strengthen. Most of them move at \$1.50 with an occasional car at \$1.60@ \$1.65.

Railroads are now through stocking. A few small shipments at bargain prices will still sell to certain roads, but the storage trade that has kept a number of mines busy during the summer, is over. With domestic business still bumping bottom, there remains little to keep Illinois and Indiana mines running except contract business. Even the anthracite strike talk has not excited the Midwest region into ordering soft coal. Only a little hurrying of anthracite and smokeless lump and egg trade is noticeable.

St. Louis Remains Lifeless

St. Louis business continues stagnant. There is little interest even in anthracite. Plenty of coke is available and a little Arkansas comes in steadily. Dealers expect the first week in August to mark the turn. Steam trade in the city and surrounding country amounts to nothing.

* Net tons, f.o.b. mines.

† Advances over previous week shown in heavy type, declines in italics.

This diagram shows the relative, not the actual, prices on fourteen coals, representative of nearly 90 per cent of the bituminous output of the United States weighted first with respect to the proportions each of slack, prepared and run-of-mine normally shipped, and second, with respect to the tonnage of each normally produced. The average thus obtained was compared with the average for the twelve months ended June, 1914, as 100, after the manner adopted in the report on "Prices of Coal and Coke, 1913, 1918," published by the Geological Survey and the War Industries Board.

Kentucky Steam Prices Weaken

Western Kentucky operators while making a hard fight, have been unable to hold prices on steam coal, due to the competition from other fields. Cheap stripper mine-run has been offered at prices as low as \$1.35 a ton. Prepared coals are selling at \$2@\$.75 according to size and quality, except some little nut offered as low as \$1.90 a ton. There has been a very fair demand for egg.

Movement is scattered. There is some domestic business moving South and also North and Northwest, including the Chicago as well as Michigan districts. Moving screenings hasn't been easy, but they have been going to numerous industrial points.

There is some strike talk in southeastern Kentucky where there are a few organized mines. There also is talk of reduction in wage scales in those sections, so that the operators can again enter the market in competition with organized fields, but under a lower production cost.

Northwest Takes Notice

A spotted awakening of domestic business is now to be noted throughout the Northwest. All summer railroads have set a good example by moving a good deal of their coal off the docks to line storage, thus clearing the way for future heavy dock business, and country dealers have fol-

lowed the same plan by taking all the anthracite they could put in. The result is that a slight pick-up in dealer business in anthracite, Pocahontas and high-grade soft coals in the regions around Milwaukee and Minneapolis finds the dealers ready. Around Duluth experts believe business in soft coal would be starting briskly were it not for recent price cuts, especially in Kentucky coals. These have left buyers dubious. They don't want to buy and get pinched by a further drop.

Prices at the Head-of-the-Lakes show another softening of about 25c. on screenings and a general loosening all along the line. Youghiogheny and Hocking screenings are still quoted at \$4, but recently 12,000 tons moved at \$3.85. Lump is \$6.50 and pile run \$5@\$.5.25. Other quotations are: Splint, lump, \$7.25; dock run, \$6.25; screenings, \$4.50. Pocahontas, \$10, \$7.50 and \$6.25. Smithing, \$8. Millers Creek Kentucky lump, \$9.50; screenings, \$5.75. Elkhorn, \$8.50, \$7.50 and \$5. Hard-coal prices are firm thus: Egg, \$12.50; stove, \$12.80; nut, \$12.85; pea, \$11; buckwheat, \$8.50.

West Also Sees Winter Coming

In the mountain regions of the West a slight market pick-up is noticeable. The Aug. 1 advance of 25c. in some Colorado coals and the fact that Colorado farmers and fruit raisers are getting returns from their crops has started some coal buying. Colorado prices are: Canon City and Walsenburg lump, \$5.75; nut, \$5.25; slack, \$2.50. Trinidad lump, \$4.75; nut, \$4.50; slack, \$3.50. Semi-anthracite egg, \$7.50; nut, \$7.25; chestnut, \$2.75.

In Utah there is a slight improvement of market, but conditions are still typical of summer. The Utah Copper Co. bought 200,000 tons with slack at \$1.25 and lump at \$3.75 and \$4. Other industrials also have been buying some. Domestic demand remains almost lifeless. Production, however, is fairly high. June showed an increase over May. The total for the first six months of the year was 2,114,128 tons as compared with 2,100,251 in 1922. Prices are unchanged.

Nothing is doing in the Kansas City region except an advertising campaign by dealers and producers. It is not stimulating domestic buying much. Of those mines that are working few are getting more than two days running time each week.

Mixed Market Situation in Ohio

Further weakness is manifest in the smokeless market around Cincinnati. While there is no move toward price cutting on the surface it is said that there has been some cuts in run-of-mine. Rejections of coal has tended to influence lower prices. West Virginia 2-in. lump was quoted \$2.50@\$.2.75 as compared with \$2.25@\$.2.50 last week and Southeastern Kentucky 2-in. lump \$2.40@\$.2.75, as compared with \$2.25@\$.2.50. Retail prices for August have been announced as follows: Pocahontas lump, \$10@\$.11, run of mine, \$7.50@\$.8, bituminous lump, \$7.50@\$.8.25 and slack, \$4.50@\$.4.75. A slight improvement for domestic sizes at Columbus and central Ohio developed more activity. Steam coals continue slow, however. There was a better demand for Pocahontas and smokeless grades as well as for Ohio-mined domestic coals. A large majority of steam coal users are waiting for bargains on distress coals, but this is not so much in evidence because of mines closing. Utility buying is more brisk while the railroads are taking their usual tonnage.

Reserve stocks are estimated at from forty-five to sixty days in most industries. The Southern Ohio Coal Exchange reports that for the week ended July 4 there were 133,532 tons of coal mined by the 442 mines reporting, with a full time capacity of 721,746 tons. No improvement is noticed in the demand for steam coals at Cleveland, but there is some new activity in the domestic trade, due probably to the fear of labor trouble in the anthracite fields. Inquiries are a trifle more brisk, causing operators and jobbers to believe there is an improved tone in the market.

The market for slack at Pittsburgh has stiffened slightly, due to more mines closing, mines that had to sell most of their product and were obtaining the poorest prices. The steel mills are buying only from hand to mouth. A moderate volume of gas mine-run is moving, but the tonnage is

generally smaller than that of screened. Business is quiet at Buffalo. Youghiogheny gas lump is being quoted at \$2.75@ \$3 f.o.b. mine. Central Pennsylvania operators at Altoona believe the bottom has been reached in prices and that the demand is on the increase. During the week ended July 22 loadings were 17,350 cars, as compared with 18,514 cars the previous week.

Decline in the preparation of egg and lump has resulted in a slight stiffening for slack in northern West Virginia. There was more inquiry from large consumers but the additional orders received so far have failed to change conditions.

Dullness Continues in New England

The market in New England shows little improvement. Consumption is much less than was expected, and more than a few large consumers are trying to hold off shipments on contract. There also are rumors of coal rejected because of poor preparation or because of some defect not looked for at the time of purchase, and this is recognized by the trade as an unflinching indication of a dull market.

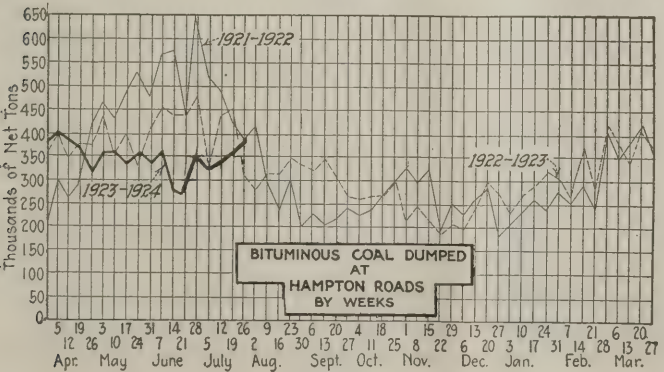

Pocohontas and New River share the dullness. While producers are pursuing an extremely close-hauled policy as to current mining there are enough agencies strenuously soliciting business to make prices rather softer than a fortnight ago. On No. 1 Navy standard grades the range is \$5.35@ \$5.60, with an occasional sale rumored at \$5.25, in each case per gross ton f.o.b. vessel. At this end, for distribution, prices on cars vary from \$6.75 to \$7.25, depending upon the factor and his view of the market. Inquiry is very light, however, and buying power has practically disappeared.

From central Pennsylvania the volume all-rail is much diminished. Except on firm contracts receipts here show a marked falling-off as compared with a month ago and while the territory is being actively canvassed at minimum prices there is little sale for current output. Shipments via the New York and Philadelphia piers also have shrunk materially and there are few today who dare predict any increase in demand during August.

A few operators in central Pennsylvania have orders enough to justify operation on practically full time for August and September. But the bulk of these orders are contracts with staple industries that have not been obliged to relax. The textile mills in New England are suffering seriously from high wage cost and competition from English manufacturers.

Demand Weak in Atlantic Seaboard Markets

Demand for soft coal along the Atlantic seaboard remains dull although some producers believe they discern a slight improvement in inquiries and actual business. Consumers are being advised to purchase coal in anticipation of autumn and winter requirements. Shippers at New York were interested in the bids opened by the War Department at Brooklyn last week for furnishing coal to army posts and arsenals in New England, the prices on which ranged from \$1.97@ \$3.75 f.o.b. mine, according to grade and quality of coal. Dumpings at the New York terminals average around 500 cars daily. Producers and shippers of bituminous domestic coals report a fair number of orders received. At Philadelphia consumers are debating long before adding to their reserve stocks, although being urged to fill their

bins. One reason given for the failure of various industries to accumulate stocks is the uncertain business conditions, particularly in the cotton and woolen goods lines. There is keen competition on some of the better grades at Baltimore. Some of the larger consumers are moving to get supplies against autumn needs, but this movement is not yet sufficient to bolster prices. The market at Birmingham is weak and sluggish with the domestic trade easy on new business. Contract coal is moving to the railroads in a satisfactory manner. Men continue to leave the district, while the mines and industrial plants are recruiting labor from the farms and lumber camps to keep their organization intact.

Last week there were received at Duluth sixty-one cargoes of coal, of which ten were anthracite. There is a fair tonnage moving to the lakes from the Ohio mines, but the movement has slowed down somewhat due to congestion at the lower ports. Loadings of anthracite for the week at Buffalo were 91,900 net tons.

Domestic Anthracite Market Stiffens

Discontinuance of the wage conference at Atlantic City resulted in a stiffening of the market for domestic coals. Shippers of independent coals were rushed with inquiries, but as many operators were already booked with sufficient orders to carry them well into August, not many new orders were accepted. Quotations became stronger. Stove coal is the shortest of the larger sizes and when shipped straight is being quoted at about 25c. more than either egg or chestnut. Some shippers are pushing pea coal in conjunction with the larger sizes, while some retail dealers are taking either bituminous or the buckwheat coals, when given egg, stove or chestnut coals. Baltimore retail dealers are rushed with orders, while few of them have any supplies of importance in their yards. Many are out of stove coal entirely. Receipts of hard coal at Baltimore for the three months ending July 1 totaled 4,098 cars, or approximately 184,000 tons. Retail dealers at Toronto say they have never had such a heavy demand for anthracite during the summer as they are now having.

"Production of anthracite in the week ended July 21 decreased 2 per cent as compared with the week preceding," says the Geological Survey. "On the basis of 38,335 cars loaded, reported by the nine principal anthracite carriers, the total output, including mine fuel, local sales and the product of washeries and dredges, is estimated at 2,005,000 net tons. Early returns on car loadings during the week July 23-28 indicate a slightly higher rate of production and a probable total output of 2,075,000 net tons."

THE RHODES FUEL CORPORATION, of New York City, was awarded a contract by the U. S. Shipping Board at New York for furnishing and delivering alongside vessels New York harbor by Aug. 7 1,600 gross tons Pool 9 coal at a price of \$5.54, or on a basis of about \$2.27 per net ton f.o.b. mine. Other prices submitted ranged from \$5.54 to \$6.25 per gross ton alongside. The bids were opened July 28.

Foreign Market And Export News

Further Decline in British Coal Production; Export Demand Decreases

Production of coal in Great Britain's mines continues to decline gradually, the output for the week ended July 14 amounting to 5,042,000 tons, says a cable to *Coal Age*. This is 264,000 tons below that of the previous week. A cable dispatch from American Commercial Attaché Tower at London to Washington as of July 20 stated that production was still decreasing slightly and that export demand was light, especially to Germany and France. Congestion due to the dock strikes continued, while price concessions were made when vessels were available.

The Welsh coal trade is quiet, due largely to the strike of dock workers. Operators, however, are confident that business throughout the rest of the year will be satisfactory, and predict that conditions will be considerably firmer from August. The few days' holiday at the beginning of August will mean a shortage of coal during the remainder of the month. Foreign buyers realize that they cannot take risks by postponing orders, and a fair amount of business is being done in spite of the present difficulties. Several contracts have been arranged and a number of inquiries are still open.

During the week ended July 6 exports of coal from the Bristol Channel showed a decline of 105,000 tons and were the lowest weekly shipments this year, excluding holiday weeks. Increased exports were made to Germany, but a severe decline to Italy.

Hampton Roads Market Stronger

The market at Hampton Roads last week was somewhat stronger, with heavier shipments moving and others in immediate prospect. Foreign movement was fairly heavy, high volatile coal being shipped for export in considerable quantities from the Newport News piers.

Coastwise trade showed more life, while bunkers continued heavy. The trade regarded the seasonal slump, which began about thirty days ago, as having been fairly well overcome. The outlook was brighter.

Export Clearances, Week Ended July 28, 1923.

News Items From Field and Trade

ALABAMA

R. A. O'Rear and Ed O'Rear have leased their Pratt Warrior coal mine on the Warrior River for five years to the Gulf States Portland Cement Co., with headquarters at Demopolis, which agrees to mine and pay royalty on a minimum of 25,000 tons of coal annually. The O'Rears retain a right to keep a commissary and collect rent for houses at the camp.

ALASKA

E. L. Bedell, president of the Alaska Bituminous Coal Co., announces that 14,000 acres of coal-bearing land situated on Moose Creek are to be exploited by a group of business men of Anchorage; that outside shipments of coal are being deferred until next April because of the necessity of supplying substantial quantities to the Alaskan R.R. in the next three months; that a spur from the Matanuska branch of the railroad to the coal properties will be completed by September, and that, as the coal is of high quality, averaging better than 12,000 B.t.u., with about 12 per cent ash, it is confidently expected that a large market can be built up with Portland and San Francisco on the Pacific coast. The company plans to purchase two ships of not less than 500 tons, one of which will be used for supplying coal to Alaskan coast centers and the other to carry coal to Oregon and California. Twenty thousand tons is said to be blocked out and no difficulty is likely to be experienced in reaching a daily production of 1,000 tons.

COLORADO

R. H. Keays, chief engineer of the Moffat tunnel, which will be under construction within 30 days, has just returned to Denver following an inspection trip. Major L. D. Blauvelt, chief engineer of the State Highway Department, who made the preliminary work on surveying with other engineers, was congratulated on his choice of a site for the tunnel. Mr. Keays, a New York city engineer, was recently appointed by the tunnel commission of five members. The Moffat tunnel will open up a coal field in northwestern Colorado heretofore handicapped by lack of direct transportation facilities.

ILLINOIS

Orient No. 2 mine of the Chicago, Wilmington & Franklin Coal Co., at West Franklin, is about to install the largest coal-mining hoist in the world. The new hoist will be more than twice as large as any coal-mine hoist in America at the present time, having two motors, one mounted at each end of the drum shaft, each with a capacity of 2,200 hp. at 40 deg. C. rise. Coal will be hoisted in skips, each having a normal capacity of 22,000 lb. and a maximum capacity of 26,000 lb. The depth of the shaft is 607 ft. and the coal will be dumped from the mine cars at the bottom of the shaft by means of rotary dumps. Under normal conditions the output per hour will be 1,500 tons, but it will be possible to increase it to 2,000 tons per hour.

The Brenner-Moxley-Mervis Co., capitalized at \$600,000, has acquired an 8-acre tract in Chicago, where it will manufacture copper rods and drawn copper wire for power transmission. The officers of the new company are: Nathan T. Brenner, president; William J. Moxley and George T. Moxley, vice-president; N. T. Brenner, Jr., treasurer, and Meyer B. Mervis, secretary.

R. E. Fagerburg, who was graduated from the department of mining engineering, University of Illinois, in June, is coal mine inspector for the Chicago, Wilmington & Franklin Coal Co., of Chicago. R. R. Lacy, who also was graduated this spring, is assistant superintendent of the Brewerton Coal Co. at Springfield. O. G. Stewart, who obtained his master's degree in coal mining at Illinois this spring, is with the Nokomis Coal Co. as Engineer at the No. 1 mine at Nokomis.

The following itinerary for the Illinois Miners' Examining Board for the month of August is announced: Collinsville, Aug.

6; Eldorado, Aug. 7; Herrin, Aug. 8; West Frankfort, Aug. 9; Du Quoin, Aug. 10; Centralia, Aug. 11; Litchfield, Aug. 13; Springfield, Aug. 14; Taylorville, Aug. 15; Danville, Aug. 16; La Salle, Aug. 17 and Peoria, Aug. 18.

The Valler Coal Co., operating one of the largest and most up to date collieries in Southern Illinois, has closed down for repairs.

INDIANA

Fourteen persons were injured, some of them probably fatally, when a mine cage upon which they were being lowered into the shaft of the Vermilion mine, fell to the bottom, a distance of 125 ft. All of the men sustained broken legs and arms and some are injured internally. J. E. Padgett, engineer, collapsed after the accident and is in a serious condition.

The Modern Fourth Vein Coal Co., of Jasonville, has been incorporated for \$350,000 by John Williams, T. G. Williams, C. W. Wenner, W. C. Clifford, F. W. Adams, O. H. Finnical and F. B. Grove.

KANSAS

Two hundred miners of the Home Riverside Coal Mining Co. at Leavenworth, went on a strike recently, refusing to load coal from a mine where another miner was ordered to quit work by the district officials because of the conditions existing there.

One-day coal service from the southeastern Kansas coal fields to Kansas City was started July 25 by the Frisco railroad, with its "Kansas City Carbon Special," a fast freight operating between the coal field and Kansas City every night except Sunday. The railroad company promises to move every car of coal routed from the southeastern Kansas field to Kansas City over its lines the night it is billed. The Missouri Pacific has maintained similar service some time. In the case of both roads the specials mean a time saving of from two to as many as eight days in deliveries to the Kansas City market.

KENTUCKY

The Bradbury-Sculin Coal Co. has put down a slope near the ill-fated Lester strip. It has a 200-acre lease and hopes to get out 200 tons daily. The company recently bought the new Prosperity mine at Carterville and also the Doran mine near Hurst. These are all 100 to 300 tons per day mines.

MASSACHUSETTS

Bids opened July 25 by the Quartermaster's Department of the U. S. Army at Brooklyn for furnishing and delivering hard and soft coal to the forts, camps, arsenals and other army buildings in the New England States and part of New York State showed a wide range. Bidders were required to submit an analysis of the coal on which they were bidding, and these with a few exceptions were confined to pool 10 quality. The prices submitted for furnishing 730 net tons of run-of-mine coal to Camp Devens, Mass., ranged from \$1.97 to \$3.75 f.o.b. mines, while bids for furnishing and delivering 1,000 net tons of run-of-mine coal to the Springfield (Mass.) Army ranged from \$1.98 to \$3.25. Prices on 450 net tons of 2-in. lump coal for Camp Devens ranged from \$2.38 to \$4.25. The same range of prices prevailed in the bids received for furnishing run-of-mine coal to the other points. For furnishing and delivering egg, stove and chestnut coal the prices submitted ranged from \$11.16 to \$12.75 per net ton f.o.b. mine, or on a basis of \$12.50 to \$14.28 per gross ton f.o.b. mine.

Agents of Hermann C. Lythgoe, chief of the division of food and drugs of the State Department of Public Health, acting under the pure coal law passed by the General Court early in the year, will dump into the harbor 700 tons of "fireproof" coal which was to have been sold to the householders of Roxbury. A month or two ago the supply of a Roxbury dealer was seized by the state when it was found to be unburnable.

The dealer asked for permission to sort the lot over and reclaim such as was found to be burnable. This request was granted and the 700 tons to be dumped represents the residue. Since the law went into effect the department has condemned also two cars of coal in Holyoke, one in Quincy and one in Haverhill. Seven cars of coal in the yards of a Boston dealer have been examined and pronounced to be not of first class quality, but of a grade which would not warrant the state to condemn it. The dealer has been directed to mix four cars of first-class coal with the seven cars before he sells it.

MINNESOTA

The City of Two Harbors is about the point on Lake Superior in which the operation of a municipal dock will be continued during the coming winter. All other points have dropped out, finding the venture unprofitable and of doubtful benefit to consumers. The City Council of that place has awarded a contract for 5,000 tons of steam coal to the Valley Camp Coal Co. at \$6.54 per ton. It is proposed to sell to consumers at \$10 per ton.

MISSOURI

In the Fulton district the 1922 scale of 10c. a bushel for digging coal in ordinary rooms and 11c. a bushel for "tight rooms" or "turn corners" will prevail for the coming year, beginning Aug. 1. Tom Kite, president of the union, also announced that if the factories and state institutions of the city award contracts to Illinois companies for coal deliveries during the next month and a strike in the Illinois coal field results in shutting off the supply here, the miners will demand a bonus for filling the contracts with Fulton coal. In the last strike the Fulton miners made good money by filling orders in neighboring towns when the mines in the other parts of the country shut down. The Fulton miners declare that there is a prospect of Illinois companies getting contracts around Fulton because they can furnish it cheaper than Fulton companies. A new railroad bridge near that city will soon enable the Chicago & Alton to haul direct to Fulton, whereas heretofore cars had to be reloaded at Mexico, and this expense added to the Illinois price made coal too costly. The Fulton miners have a local union but are not affiliated with the United Mine Workers of America and make their agreements independent of the national body.

NEW YORK

The Virginia Iron, Coal & Coke Co. for the quarter ended June 30, reports net income of \$114,984, after interest and taxes. After preferred dividends, this equals 52c. a share on the \$10,000,000 common stock, which compares with \$243,559, or \$1.81 a share, in the first quarter, and \$95,959, or 33c. a share in the corresponding quarter of last year. The gross operating revenue for the quarter ended June 30 was \$2,241,133, as against \$210,782 for the quarter ended June 30, 1922. The net earnings for the six months ended June 30 were \$358,543, against \$14,912 in the corresponding six months a year ago.

OHIO

The Cincinnati Retail Coal Dealers' Association held its annual outing recently at Tower Hill, on the Little Miami River. David Minten and Tom Bolder were in charge of the affair.

PENNSYLVANIA

An explosion wrecked the bridge of the Baltimore & Ohio R.R., a half mile from Holsopple, Somerset County, Tuesday night, July 17, leaving the ends hanging from either side of the river bank. The bridge is used largely by the Hillman Coal Co., for transporting coal cars from Holsopple to Jerome, a distance of five miles. The explosion occurred at the center of the 200-ft. bridge. The only explanation given was that labor trouble at the Hillman Coal Co. had near Jerome might be responsible. Nine men were arrested at Boswell, charged with destroying the bridge, and eight were given a hearing before Justice of the Peace C. S. Ickes on July 24, held for court trial and placed under \$2,000 bail each. The eight charged with dynamiting the bridge are: Arthur Ramsell, secretary of the Jerome local, United Mine Workers; William Gregory, Michael Reskoffsky, Michael Kelsback, John Labotka, Munzio Pacifico, Clement Accitello and John Goodiska. John Braenzanski, a barber of Jerome, was held as a material witness.

Pacifico, it is alleged, offered damaging evidence against the other seven men when accorded a separate hearing on July 23. Replacement of the bridge will cost \$100,000.

Frank Gibbons, aged 31, who was caught under a fall of rock at the Raub Coal Co.'s mine in Luzerne July 23 and entombed for almost nine hours before being rescued, died from his injuries that evening in the Nesbitt West Side Hospital.

A coal test house situated in No. 5 colliery yard of the Hudson Coal Co. at East End, Wilkes-Barre, was destroyed by fire on July 21. Several cars of coal standing on nearby tracks were destroyed.

Ground was broken July 24 at Scranton for the monument to John Mitchell to be erected by the members of the United Mine Workers. Neil J. Ferry, of McAdoo, an international organizer of the miners, turned the first shovelful of dirt. The monument will be on the east side of Court House Square fronting Adams Avenue and will cost \$65,000.

Robert Johnson, of Pittston, who has been State mine inspector of the eighth inspection district during the last seven years, has tendered his resignation to the State Department of Mines. Under the last appointment Johnson had one more year to serve.

Evan B. Williams, superintendent of the Hudson Coal Co. at Gravity Slope, Archbald, has been transferred to the Pine Ridge colliery, at Miners Mills with charge over Laffin colliery also. Nathaniel Dixon, superintendent at the Clinton colliery in Vandling, will succeed him.

The annual first-aid competitions conducted by the Susquehanna Collieries Co. in the five divisional headquarters will be held as follows: At William Penn, near Shenandoah, Aug. 31, at 6:30 p.m.; at Lytle, near Minersville, Sept. 6, at 7 p.m.; at Lykens, Sept. 7, at 7:30 p.m.; at Nanticoke, Sept. 11, at 7:30 p.m.; at Shamokin, Maysville Park, Sept. 18, at 7 p.m. These will be open-air events with the exception of the meet at Nanticoke, where the first-aid tests will be conducted in the state armory.

The York Farm Washery Co., near Pittsville, so reduced the great pile of culm from which it has been reclaiming coal of domestic and steam sizes, that it will be cleaned up in about six months. The culm bank was started more than a quarter of a century ago when the Lehigh Coal Co. opened the big colliery at York Farm. The company abandoned mining there, because of the gaseous condition of the operation and the great expense of removing the coal.

Eddy Creek breaker of the Hudson Coal Co., at Olyphant, one of the oldest breakers of that company, has ceased to prepare coal for the market and from now on all coal handled from the different openings at this colliery will be shipped to the new Marvine and Olyphant No. 2 breakers. Nearly 100 men and boys will be thrown out of employment, it is estimated. It is reported that these two breakers will handle only the coal from the Eddy Creek colliery openings until a big modern breaker is constructed which will take care of all coal mined by the Hudson company in Olyphant, Dickson, Blakely and Throop.

The Lamoka Coal Co., headed by Walter J. Bennett, of Towanda, and capitalized at \$100,000, has taken over the coal lands recently owned by William Matchett, J. J. Morley, and E. J. Howe, and known as the Cash Coal Lands, in Bradford County. It is understood arrangements have been made for the installation of equipment that will provide for the removal of coal on a much larger scale than has ever before been attempted in this locality.

Six men were badly burned by an explosion of gas in the Avondale colliery of the Glen Alden Co., July 20. The victims were rescued after a battle with the flames that followed the explosion. Alex. Minnick, one of the men injured, died later at the Nanticoke hospital. Two others may not recover. Mine officials state that the explosion was caused by a ventilating door being left open. This allowed a body of gas to sweep into the gangway where the men were working and it was ignited by one of the men lighting a match.

Two electric pumps are to be installed by the Hudson Coal Co. at the No. 3 pump station, Carbondale, which will lift 10,000 gallons of water a minute. Workmen are now engaged in removing the old pumps, which were operated by steam, and it is asserted that hereafter the work will be done during one eight-hour shift instead of two twelve-hour shifts, as at present.

The Pennsylvania Topographic and Geological Survey has completed close field

and office studies of mines, mining conditions and coal waste in every bituminous coal-producing district in the state, begun last December for the U. S. Coal Commission. An estimate of coal reserves in each county which produces bituminous coal also has been completed and is included in the report to the federal commission. It is said the report will be made a part of the report which the Giant Power Commission's survey will make. This commission will soon be named by Governor Pinchot, who has plans for the utilization of the state's power from both coal and water. His plan contemplates the use of fuel near its source for the generation of electric energy and includes anthracite as well as bituminous coal.

Umpire Charles P. Neill rendered six decisions on July 22, five of which were decided in favor of the miners. The case that went against the men was that of certain contract miners at No. 4 shaft colliery against the Lehigh Coal & Navigation Co. in the Panther Creek section. When the 1922 suspension was directed the men left their tools in a storage place in the mines. During the suspension there was a fire in that section of the mines and the tools were either destroyed or taken. Umpire Neill denied the request for an order that the men be paid for their lost tools. Another case was that of contract miners at Audenried colliery No. 4 of Lehigh & Wilkes-Barre Coal Co. In this the terms of a 1917 agreement were in dispute, owing to a penalty of suspension imposed on the miners for refuse in coal he had mined. The decision directs that he be paid for the period of suspension. The decision, however, does not decide contention of either side as to the terms of the 1917 agreement. Furnishing of coal to a family at Audenried by the Lehigh and Wilkes-Barre Coal Company is directed at the usual rates allowed employees. The other three cases involve rates paid the men and in each the workman is directed paid at the rate he sought. The cases are against the Lehigh Coal & Navigation Co.

The Hudson Coal Co. recently entertained the employees of three of its mines at luncheon and an entertainment at which the addresses were illustrated by lantern slides of conditions existing in the mines. On the evening of July 24 upward of 1,000 employees of the Olyphant and Eddy Creek collieries at Olyphant were given a box luncheon by the company at which Sterling E. Van Horn, superintendent, presided. Two days later over 500 miners of the Coalbrook mine were entertained similarly at Carbondale at which William Davison, colliery superintendent, made an address on "Practical Mining Questions." Other speakers were Kenneth Lambert, colliery engineer, and Charles W. Wagner, superintendent of explosives. The employees of the Pine Ridge, Delaware and Laurel collieries at Scranton were entertained on the colliery grounds on July 23. Superintendent J. B. T. Jones, who was the principal speaker, explained new mining methods calculated to make the jobs held by the miners safer and better, declaring the company's aim is greater safety, greater production and a better grade of coal. It is understood that it is the purpose of the company to explain to the miners, by use of slides, both new and better means of drilling for coal, and methods by which black powder might be as effectively used as more expensive dynamite.

SOUTH DAKOTA

The Independent Coal Co., of Huron, has been incorporated for \$300,000 by W. A. Johns, Fred Stoll and William Wilkinson.

WEST VIRGINIA

The Black Hawk Colliery Co., of Detroit, is building a new tippie equipped with Marcus screens at its property at Big Creek.

The Coe Pocahontas Coal Co., of McComas, has contracted with the Roberts & Schaefer Co. for a steel tippie complete with loading booms, to be installed at its mine at Monclo.

E. E. White, president of the E. E. White Coal Co., and of the Winding Gulf Operators Association, plans to sail for Europe during the early part of August. Mr. White will remain abroad until about Oct. 1.

The Dell Coal Co. is the name of a new concern just launched by Charleston people, having a capital stock of \$50,000 and with headquarters at Charleston. Among those having an active part in forming this concern were E. D. Haywood, F. L. Thomas, H. H. Corrie, H. W. Ball, all of Charleston, and J. M. Hopkins, of Danville.

First-aid and mine-rescue contests will be held at Huntington, Aug. 11, according to

an announcement by the Department of Mines of West Virginia. It is expected that teams from all parts of the state will participate, and from the winners representatives will be selected for the national mine-rescue and first-aid contest.

Men prominent in business circles in southern West Virginia have organized the Lopinsky corporation of Welch, with a capital stock of \$300,000, expecting to operate on a large scale in the Pocahontas region. Behind the new company are Eugene Lopinsky, Mary Lopinsky, Morris H. Lopinsky, N. J. Rhodes and Graham Sale, of Welch.

W. L. Lee and associates of Glen Jean have organized the Dun Glen Fuel Co., with a view to operating in the vicinity of the Glen Jean. The new corporation is capitalized at \$50,000. Several large companies, including the McKell Coal & Coke Co., are operating in the same territory. Having an active part in organizing this company were Charles Ash, Belle Ash and C. D. Calloway, of Glen Jean and W. L. Lee and Goldia Fultz of Fayetteville.

The Sandor Coal Co. has been organized with a view to operating in the Harrison County field, being capitalized at \$50,000. The general office of the company is to be at Clarksburg. Leading figures in organizing this concern were J. A. Sandor, of Grafton; J. E. Kennedy and Marie Simpson, of Fairmont; J. A. Hornyak and John Vargo of Farmington.

Officials of the United States Coal & Coke Co. and of the Crystal Block Coal & Coke Co. recently gave a dinner at the club house at Gary in honor of Colonel Edward O'Toole, head of the United States Coal & Coke Company operations in McDowell, and Mrs. O'Toole, who returned a few weeks ago from an extended trip through South America, visiting their son, William O'Toole, U. S. Minister at Paraguay. Others present were W. J. Jenks, general manager of the Norfolk & Western Ry., of Norfolk, Va.; former Congressman and Mrs. Wells Goodykoontz, of Williamson; Mr. and Mrs. I. J. Rhodes, Mr. and Mrs. L. A. Osborn, Mr. and Mrs. J. N. Harman, Dr. and Mrs. Rutherford, Mrs. L. C. Anderson, Rummell Anderson, Mr. and Mrs. W. J. Hatfield and Mr. and Mrs. McGinnis Hatfield, all of Welch.

The following West Virginia coal companies have discontinued their corporate existence: Springdale Coal Co., of Morgantown; Superior Eagle Coal Co., of Huntington; Middle Fork Mining Co., of Huntington; Madne Coal Co., of Huntington; Barnsdall Coal Co., of New York; Madison Coal Co., of Huntington; Procter Eagle Coal Co., of Huntington; Hart's Run Coal & Coke Co., of Uniontown, Pa.; Omar Coal Co.; Carroll Coal Co.; Procter Coal Co., all of Huntington. The Eagle Island Coal Co., of Huntington has decreased its capital stock from \$600,000 to \$200,000. Authority has been granted to the S. J. Patterson Pocahontas Co., of Dayton, Ohio, to withdraw its business interests from the state.

Several West Virginia coal concerns have reduced their capital stock in the amounts specified below: Buffalo Coal & Export Corporation, from \$250,000 to \$50,000; American Land & Mining Company, from \$50,000 to \$5,000; Northern Fuel Co., from \$125,000 to \$100,000; Ranger Coal Co., from \$200,000 to \$50,000; Federal Coal & Coke Co., from \$750,000 to \$50,000; The Fitz Coal Co., from \$200,000 to \$50,000; Eagle Island Coal Co., from \$500,000 to \$200,000.

It is reported that the Coal River Collieries Co., which operates in Boone County, as well as in Kentucky, and controlled by members of the Brotherhood of Locomotive Engineers, has obtained an option on the coal holdings of W. E. Deegans in several counties in southern West Virginia.

The Gage Coal & Coke Co., with headquarters in Pittsburgh, contemplates extensive improvements to its property four miles South of Belington, in Barbour County. The company owns a large acreage on the west side of Tygart Valley River, where it has had a mine in operation for several years. At this point a large power plant is being installed, consisting of three 125-h. p. boilers and a 250-k. w. generator, an aerial tramway of modern type capable of delivering approximately 1,200 tons per day of eight hours, will be installed during this summer, to transport the coal from the tippie to the east side to be loaded on the Western Maryland Ry., after having been converted into coke. Approximately \$40,000 will be spent in making these improvements. This company also has a mine located on the Western Maryland Ry. where they manufacture coke from 60 beehive ovens, modernly equipped, from

which the coke is drawn with a Covington Coke Extractor.

The following West Virginia coal corporations have gone out of business, their charters having been surrendered: Lundale Coal Co., Amherst Fuel Co., Three Forks Coal Co., Elliott Splint Coal Co., National Gas Coal Co., Consumers Fuel Co.

Osman E. Swartz, of Fairmont, whose appointment as general counsel of the Consolidated Coal Co. was recently announced, was the guest of honor at a dinner given by the Consolidation Coal Co. and the Monongahela West Penn. Public Service Co., attended by 73 guests from various sections of the country. Tusca Morris, of Fairmont, of the legal staff of the consolidation company, was toastmaster and among others who responded to toasts were George M. Alexander, president of the Monongahela West Penn Public Service Co., Fairmont; A. M. Lynn, president of the West Penn Co. of Pittsburgh; D. I. Cahill, general counsel of the West Penn Co., Pittsburgh; Hugh H. Snoderly, assistant general auditor of the Consolidation Coal Co., New York; George M. Hoffheimer, of Clarksburg; Judge James A. Meredith of the West Virginia Supreme Court, Charleston. The dinner was given at the Deer Park Hotel, at Deer Park, Md., and signalized the departure of Mr. Swartz for New York, where he will succeed the late Col. S. W. Walker as the head of the legal staff of the Consolidation Coal Co.

Signalizing another important change in the ownership of mining properties in southern West Virginia was the purchase about the end of June of the capital stock of the Red Jacket Consolidated Coal Co. by the W. M. Ritter Lumber Co. The plants of the company on Mate Creek are now producing at the rate of about 4,500 tons daily. In course of construction is plant No. 5 and with its completion in the near future, about 1,000 tons per day will be added to the capacity of the company. It is proposed to build a four-track domestic coal tippie on Mate Creek not far from the present Junior tippie in new territory in the Red Jacket seam where it will be possible to develop a production of 1,200 tons a day. A new plant is to be built in the vicinity of the old Logan tippie on Lower Red Jacket from which by-product coal taken from the Alma seam will be shipped, the company owning a large acreage at this point. A production of 1,000 tons is expected at this plant. At plant No. 2 the old Junior tippie will be rebuilt. Improvements under way and to be made will bring production on Mate Creek alone up to 8,000 tons a day.

WASHINGTON

W. J. Gallagher, of Seattle, has subleased the Superior coal property in Chelalis from A. F. Plant and will operate the mine in the future.

WISCONSIN

The city purchasing board of Milwaukee has decided to continue to favor Eastern coal in the specifications governing the competition for the city's annual fuel supply. Dealers in Western coal claimed that they were being discriminated against and asked a revision of the specifications. A special committee will make a thorough study of the matter before another year. The city now uses 65,000 tons of coal. This amount will be increased by 22,000 tons as soon as a new water pumping station is completed.

WASHINGTON, D. C.

Revenue received by the government from royalties on mineral leases upon public lands and from the sale of such lands has amounted during the past two years to \$24,843,809, according to the Department of the Interior. Of this revenue \$12,981,809 came from royalties on mineral leases. Sales of coal leases totaled \$13,105 and royalties on coal leases in Alaska amounted to \$5,309.

CANADA

Coal production in British Columbia during June totaled 186,160 tons, an increase of 23,848 tons over that of the previous month. The collieries of Vancouver Island produced 129,616 tons last month, which is 32,252 tons in excess of that for May. It is clear, therefore, that the coal business has been improving on the coast and falling off in the interior. The Nicola-Princeton field also shows a slight increase in production, one thousand odd tons, for which the Middlesboro and Coalmont collieries are largely responsible. In the Crow's Nest Pass field there was a drop of 9,507 tons in output for June as compared

with May. The Coal Creek Colliery fell off 8,694 tons, that at Corbin 954 tons, while the Michel Colliery increased its output 141 tons. The poorer showing in this section of British Columbia no doubt is accounted for by the barrier erected by the Fordney tariff, making export to the United States at a profit practically out of the question, and the lack of demand in the Middle West. Following are the production figures for June:

Vancouver Island District	
Canadian Collieries:	
Comox Colliery	Tons
Extension	22,661
South Wellington	20,264
Western Fuel Corporation of Canada:	5,164
No. 1 Mine	27,002
Reserve Mine	17,801
Wakesiah Mine	7,377
Granby M. S. & P. Co.	19,626
Nanoose Wellington Colliery	5,176
East Wellington Colliery	3,723
King & Foster	822
Total	129,616
Nicola-Princeton District	
Middlesboro Collieries	6,397
Coalmont Collieries	9,609
Princeton Collieries	809
Total	16,815
Crow's Nest Pass District	
Coal Creek Colliery	22,254
Michel Colliery	15,388
Corbin	2,087
Total	39,729
Total for province	186,160

On recommendation of Commissioner Chisholm the Toronto Board of Control has decided to use the screenings from last year's supply of Welsh coal for the manufacture of briquets.

A mine-rescue competition was held at Blairmore, Alberta, in July, under the joint auspices of the mines department of the Province of Alberta and the Rocky Mountain branch of the Canadian Mining Institute. In addition to the mine-rescue and first-aid contests for men, there were prizes for the best first-aid demonstrations by women individually and in teams and a shield for juvenile competitors. Each team was given a different problem of a practical nature, such as may easily occur in a coal mine, involving the use of a breathing apparatus and a knowledge of first aid, and the work of the various teams clearly demonstrated the value of constant training with the apparatus in conjunction with organized team work. The work of the competing teams was appraised as follows: First, Michel Team, B.C. and Hy Grade (tie); third, Fernie No. 2; fourth, Bellvue No. 3; fifth, Nordegg; sixth, Fernie No. 1 and Coal Creek (tie); eighth, A.B.C., Drumheller; ninth, Bellevue No. 1; tenth, Blairmore No. 1; eleventh, Blairmore No. 2; twelfth, Lethbridge. The judges were Messrs. Horne, McDonald, Howell and Cranston, inspectors of mines for Alberta, and H. E. Miard and James Dickson, mines department, British Columbia.

Western Canada can hardly sell coal in Ontario. Dr. Charles Camself, deputy minister of mines for the Dominion and who acted as chairman of the committee that went thoroughly into the problem in recent months, recently said that there was nothing to add to the committee's report. Generally it had been found that the coal fields of eastern Canada could take care of the requirements of the maritime provinces, Quebec, and a small part of northern Ontario; that the prairies, from a point near the western limits of the Great Lakes, and British Columbia were independent, having supplies within their boundaries that were adequate, but that there was a gap between the east and the west, comprising the greater part of Ontario, that, under present conditions, must be dependent upon coal imported from the United States. The investigation had served a good purpose in making clear the situation as to the fuel resources and fuel requirements throughout the Dominion, and with a thorough grasp of the problem it should be easier to regulate distribution in the future in the best interests of all consumers should regulation be necessary.

John L. Lewis, president of the International body of the United Mine Workers of America, has instructed William A. Sherman, president of District 18 (Eastern B.C. and Alberta), that it would be well to withdraw the call issued for a general labor conference in western Canada to decide upon a policy for sympathetic action in support of the striking miners of Nova Scotia. Mr. Lewis stated that the miners of District 18 must carry out the rules and

policy of the U. M. W. of A. and fulfill their obligations to the operators under the agreement in force. At the time of writing Mr. Sherman had not withdrawn the call but had promised a statement at a later date.

Output of coal from Canadian mines during April amounted to 1,287,400 net tons, a decrease of 12 per cent from the total for March, but an increase of 38 per cent over the average for the corresponding month of the three preceding years, according to the Dominion Bureau of Statistics. Production for the month showed decreases of 83,000 tons in Alberta, 70,000 tons in British Columbia, 16,000 tons in Saskatchewan and 10,000 tons in New Brunswick. There was an increase of 2,000 tons reported in Nova Scotia. The cumulative output from all mines for the first four months of 1923 amounted to 6,153,600 tons, an increase of 25 per cent over the preceding three-year average for the same period. Imports from the United States and Great Britain amounted to 1,171,200 tons, as compared with 1,817,700 tons in March, a decrease of 36 per cent, but 40 per cent greater than the preceding three-year average for the month. For the first four months of 1923 total importations were 5,956,800 tons, an increase of 35 per cent over the three-year average for the period. Imports of anthracite for April were 415,400 tons, of which 361,100 tons of egg, grate, stove, etc., sizes came from the United States, and 16,400 tons of the same sizes from Great Britain. The balance consisted of buckwheat and rice sizes of which 31,300 tons came from the United States and 6,600 tons from Great Britain. Exports of Canadian coal during April were 128,600 tons, as compared with 234,500 tons in March. Comparison of the April exports with the preceding three-year average showed an increase of 58 per cent.

Imports of about 55,000 tons of Scotch and Welsh anthracite have been received so far this season at Montreal, and if the demand continues the amount probably will be trebled before the close of navigation. Local dealers state that after last year's experience consumers will take every precaution to obtain an adequate supply.

Association Activities

Charles L. Dering, president of American Wholesale Coal Association, has appointed the following committees: Trade relations, Seth W. Morton (chairman), Albany, N. Y.; Charles A. Owen, New York City, and Charles L. Couch, Buffalo, N. Y. Budget, Lyle H. Dayhoff (chairman), E. M. Platt and G. H. Merryweather, all of Chicago, Ill.

Colonel A. C. Earnshaw has been appointed commission of the Chicago Coal Merchants Association. Colonel Earnshaw assumed office Aug. 1, taking the vacancy caused by the resignation of Commissioner Kendall, who joined a coal company sales organization a month or so ago. Colonel Earnshaw comes from the United States Internal Revenue office at Chicago. He is a world war veteran and has been in Chicago two years, coming from New York, where he was with the government in the Post Office Department. It is his first venture in the coal business.

Obituary

Benjamin U. Taylor, leading coal dealer of Olean, N. Y., and one of the wisest known business men of that district, died July 21, at the age of 69 years, leaving a wife and several children.

James R. Brennan, a coal merchant and prominent citizen of Brackville, Ont., died July 25, at the age of 76 years. He was a member of the town council for four years and harbor master of the port of Brockville.

William Leventry, died at his home in Johnstown, Pa., July 23, aged 73 years. For the past eight years he was engaged in the coal business with his brother, Lewis Leventry, under the firm name of Highland Coal Co., of which he was president.

Lafayette Mack Hall, 72, formerly a mine official in the Seco, Ky., district, and well known in southeastern Virginia, where he was formerly manager of the Gladeville Coal Co., died at Wise, Va., July 20.

Coke and By-Products in 1921, by R. S. McBride, U. S. Geological Survey, Washington, D. C. Pp. 444; 6x9 in.; illustrated. Contains statistics showing production, distribution and utilization of coke and by-products obtained from coke ovens in the United States in 1921, covering both bee-hive and byproduct coke.

Traffic News

Permission has been granted the **Hocking Valley Ry.** to obligate itself to pay \$5,098,000 for 2,000 70-ton steel hopper-bottom cars.

There are persistent rumors at Chattanooga, Tenn., that Henry Ford and George L. Carter, of Johnson City, Tenn., a financier, will construct a new coal line from the southern West Virginia coal fields through Bland, Wythe and Carroll counties, Virginia, and across North Carolina via Mount Airy to the coast. Reports are that the road is to connect with Mr. Ford's present line, serving his Kentucky coal fields.

The Rockdale, Sandow & Southern R.R. has applied to the Interstate Commerce Commission for authority to construct and operate a line of standard-gauge railroad from Marjorie, on the International Great Northern, to Sandow, twelve miles distant. It is stated that this line will open for immediate development approximately 1,000 acres of proven lignite. In that area the bed is said, in the application, to have an average thickness of 13 ft., providing a recoverable tonnage in excess of 13,000,000 in a territory remote from coal mines, in which the cost of fuel is excessively high. Beyond the proposed terminus of the road an additional 50,000,000 tons of lignite coal is recoverable, the applicant declares.

As the result of a comprehensive and extensive survey and investigation, the Baltimore & Ohio R.R. has announced its new car-rating figures and ratings for the various divisions reaching the coal fields of northern West Virginia, the result being a marked reduction in the aggregate ratings for many of the Baltimore & Ohio divisions. Ratings are made retroactive to July 16, according to the bulletin governing distribution just issued by the B. & O. On the new basis the Monongah Division will be entitled to 1,888 cars, the Connellsville Division to 985 cars, the Charleston Division to 252 cars, the Morgantown & Kingwood, Cumberland, Virginia Northern and Preston railways a combined rating of 236 cars.

H. A. Cochran was appointed coal traffic manager, of the Baltimore & Ohio R.R., Baltimore, Md., effective July 16. He takes the place of H. M. Matthews, who recently died.

The Reading R.R., has been authorized by the Interstate Commerce Commission to assume the obligation of the issuance of \$6,000,000 in equipment certificates to be expended in the purchase of new locomotives and cars. The new equipment includes 25 locomotives at \$38,192 each; 500 70-ton steel hopper coal cars at \$2,072.45 each; 500 70-ton steel hopper coal cars at \$2,135.37 each; 500 60-ton steel hopper coal cars at \$2,067.82 each; 500 70-ton steel hopper coal cars at \$2,075.58 each.

The Unadilla Valley Ry., has been authorized to issue notes to cover, among other things, a coal storage and locomotive fuel station at New Berlin at which engines are to be loaded by gravity, and ten 50-ton hopper coal cars to cost \$2,500 each.

The Interstate Commerce Commission has authorized the Chicago & Northwestern Ry. to assume obligation for \$4,755,000 of equipment certificates to be applied on the purchase of the following property: Forty Mikado-type freight locomotives at \$45,395.06 each; 10 Pacific-type passenger locomotives at \$43,200 each; 140 milk express cars at \$5,804.93 each; 800 50-ton steel ore cars at \$1,673.70; 800 50-ton steel underframe gondola cars at \$1,919.41 each; 200 50-ton steel underframe flat cars at \$1,581.10 each; 40 10,000-gallon steel tankers at \$2,550 each.

As the Interstate Commerce Commission refused to permit the Virginian Ry., to build a spur between Elmore and Mullins, for a distance of about a mile and a quarter down the Guyan River, in order to permit the Pocahontas Fuel Co. to open a new mine, it is now stated that the coal company will build the spur on its own responsibility. Pending such construction, the Virginian will demand a rehearing on

this application and if that is denied then an appeal will be taken to the federal courts, the appeal to be based on the contention that the interstate commerce commission has gone beyond the authority vested in it by law.

Earnings of coal roads cut last year at this time on account of the coal strike, snapped back to normal in June with a substantial net income as against a deficit last year. The Lehigh Valley reported net operating income for June amounting to \$1,012,023, against a deficit of \$32,044 last year. June gross was \$7,052,888, against \$4,694,664, and the balance after taxes was \$1,054,963, against \$20,154. Six months' gross was \$36,280,628, against \$31,017,207, while balance after taxes was \$897,100, against \$2,049,260, and net operating income \$631,720, against \$1,802,808 for the same period last year. The Delaware & Hudson Co. for June showed net operating income of \$1,155,890, against a deficit of \$292,905 last year. Gross was \$4,454,137, against \$2,297,070, and balance after taxes \$1,197,051, against a deficit of \$261,398. For the six months ended June 30 last gross was \$22,961,570, against \$18,866,476; balance after taxes \$2,789,696, against \$1,467,639, and net operating income \$2,510,575, against \$1,494,268 for the same period of the previous year. The Philadelphia & Reading showed a net operating income of \$2,544,385, against \$123,507 last year. Gross was \$8,959,203, against \$5,673,491, and balance after taxes \$2,681,006, against \$382,957. Six months' gross was \$55,077,844, against \$38,260,119; balance after taxes \$17,192,283, against \$6,970,448, and net operating income \$15,938,308, against \$5,582,788. The report of the Norfolk & Western showed net operating income for June amounting to \$1,587,249, against \$3,403,803 last year. Gross was \$7,881,048, against \$9,478,091, and balance after taxes \$1,304,034, against \$3,259,622. Six months' gross was \$44,938,946, against \$46,011,351; balance after taxes, \$6,814,339, against \$12,271,486, and net operating income \$3,892,633, against \$13,574,542 for the corresponding period of 1922.

Coming Meetings

The tenth annual Tennessee First-Aid Contest and Miners' Field Day will be held at Knoxville, Tenn., Aug. 4, in the Knox County Court Yard, under the auspices of the Tennessee coal operators, state mine inspectors and the U. S. Bureau of Mines. R. E. Howe, secretary of the Southern Appalachian Coal Operators Association, secretary-treasurer, J. M. Webb, of the U. S. Bureau of Mines, is instructing the first-aid teams.

The American Institute of Mining and Metallurgical Engineers will hold its annual meeting in Canada. The meeting will start Aug. 20 at Toronto and end Aug. 30 at Montreal. Secretary F. F. Sharpless, 29 West 39th Street, New York City.

Rocky Mountain Coal Mining Institute will hold its summer meeting Aug. 27 to 29 at Salt Lake City, Utah, in conjunction with the International Safety and First-Aid Meet. Secretary, Benedict Shubart, Denver, Colo.

New York State Coal Merchants' Association will hold its annual convention on Sept. 10-12 at Sacandaga Park, N. Y. Executive secretary, G. W. F. Woodside, 250 Arkay Building, Albany, N. Y.

Oklahoma Coal Operators' Association will hold its annual meeting Sept. 13 at McAlester, Okla. Secretary, A. C. Casey, McAlester, Okla.

The American Mining Congress will hold its twenty-sixth annual convention in conjunction with the National Exposition of Mines and Mining Equipment, Sept. 24-29, at the Milwaukee Auditorium, Milwaukee, Wis. Secretary, J. F. Callbreath, Washington, D. C.

National Safety Council will hold its twelfth annual safety convention at the Buffalo Statler Hotel, Buffalo, N. Y., Oct. 1-5. Managing director and secretary, W. H. Cameron, 168 No. Michigan Ave., Chicago, Ill.

The West Virginia-Kentucky Association of Mine, Mechanical and Electrical Engineers will hold its annual meeting Oct. 19-20 at Huntington, W. Va. Secretary-treasurer, Herbert Smith, Robson-Prichard Bldg., Huntington, W. Va.

Coal Mining Institute of America will hold its annual meeting Dec. 19, 20 and 21 at Pittsburgh, Pa. Secretary, H. D. Mason, Jr., Chamber of Commerce Building, Pittsburgh, Pa.

Death of the President

RECONSTRUCTION after the War or "the return to normalcy," as he preferred to term it, was the task of President Harding and admirably he performed it. With many a European country on the verge of bankruptcy as the result of taking the short and easy way of spending money in excess of yearly income we can appreciate the better the saner and more honest way of President Harding, which avoided inflation and the building of debts as being neither upright nor profitable. Working men and capitalists alike should appreciate the fact that by careful pruning of governmental expenses the Cabinet led by President Harding has kept our dollars from further depreciation in value even though we are a long way from the pre-war basis.

Nor was he less fortunate in his foreign affairs. We had fairly started, about the time he became President, on what we discovered was to be a race of armament. Our big construction had begun to arouse doubts in the mind of another nation, when with the sanity inspired by President Harding and Secretary of State Hughes, international disarmament was provided and a race that would have been expensive and exhausting to the participants and likely to end in another war was definitely halted.

These were two of President Harding's achievements. Too many of his other policies are footballs of politics and therefore cannot be mentioned here. Reference should, however, be made to his quality as a man. Throughout his administration not a breath of scandal was uttered against his actions or his purposes. His quiet dignity, his democracy, that was real without being demonstrative, his patience, his calmness, the sincerity of his smile, his ability to make friends with the Senate and House and his freedom from petty jealousies endeared him to the public.

His Presidential messages were not compositions of literary merit but he proved, as many men before him have done that power of execution often goes with a weakness in the power of expression. The deceased President was before all an executive. He looked well ahead, he got things done, he did them without fluster, he leaves his successor the management of a state, meeting its obligations readily, paying off its debts systematically and free from foreign complications or ill will.

But these labors were not accomplished without a superhuman burden being placed on the man that performed them. Our President is unfortunately for his health and well being both the titular and actual head of our Government. He must do the honors as well as direct the work of the nation. In foreign countries the monarch takes care of the one and the prime minister of the other. But even then, the King is freer than the president. The dignity that hedges a king saves him from having to meet all and sundry, whereas those

who drift to our national capital cannot leave until they have paid their respects to the President. Only after this has been achieved can they go back to Podunk and discuss the warmth of the handshake they received from the great man with their admiring or envious neighbors.

And the prime minister, he is a smaller figure and is surrounded by members of a cabinet any one of whom, owing to the closer accord of parliamentary and cabinet activity abroad, is almost as illustrious as himself. Thus the prime minister can travel from one end of the country to the other without making a single speech. Custom has made it possible for him to disappear from the public eye, but every journey of the President is now a long series of ovations, banquets, handshakings and speeches. He hardly knows night from day.

Mr. Harding, it is true, had in his cabinet two men who were at the time of their appointment better known than himself, but that did not upset the Constitution which makes the President the sole executive or the tradition which makes him the leading figure in our national life.

Much of our trouble comes from custom, and a breaking of precedent and the formation of new customs must cure it. The public must be content to dispense with courtesies and activities that broke the voice of Roosevelt, destroyed the health of Wilson and proved fatal to Harding.

The Anthracite Dispute

MANY things may happen between the first and last weeks of August. Although the anthracite mine workers have thrown down the gauntlet, saying they will not further discuss a contract to work after this one expires on Aug. 31 unless the operators forthwith grant the first of their demands—that for the check-off—they may change their minds. In fact there is a well-grounded belief in the trade and government circles that the men at the mines are more interested in wage increases accruing to their benefit than in the check-off, which is for the ultimate aggrandizement of the union officials. It is quite possible the union, finding the operators in a determined position on this issue, may shift at the last moment and offer to accept a compromise in the way of a wage increase. That, however, is pure speculation, for no one now knows even what the next move is to be. John Lewis has remained at Atlantic City awaiting developments; the operators are near by at Philadelphia. Negotiations can be immediately renewed at the suggestion of either party. Each is waiting for the other to weaken; both are waiting to see if the government will act to bring them back together.

For the time being the check-off is before the country. It is an obscure issue, one on which we may wait a

long time before there is a definite expression of public feeling. The term is familiar to people generally, for it was widely advertised as an issue in the 1922 soft coal strike, but after all a minor issue and one that did not figure in the final settlement last year. The soft coal operators then tried to throw it out and of course failed. They tried to have it rejected in the settlement of the 1919 strike, but the Robinson Commission did not act on it.

The union now professes not to understand why there should be objections on the part of the anthracite operators to granting the check-off in the hard-coal region. It is such a small matter—just deducting \$1 a month from each man's pay. John Lewis in the *New York Times* of Sunday, Aug. 5, puts it thus: "This check-off is merely an arrangement whereby the individual mine worker may have his monthly dues to the union, amounting to \$1, deducted from his earnings in the same manner as the operators deduct money for store bills, explosives, rent, house coal, tools, mine supplies, taxes and funds for beneficiary organizations." On such a simple thing, he says, the operators would plunge the industry into a strike and deprive the people of coal.

That is all there was to the check-off some thirty years ago when the soft-coal operators began its collection in Ohio. If that were all there were to it today, the soft-coal operators would not be opposing it, nor would the union be so keen for it in the anthracite region. The check-off has changed, however, and now is the instrument whereby the United Mine Workers' organization draws millions of dollars each year to finance the most arrogant labor monopoly in this country. For it is not the simple matter of \$1 per man per month that Mr. Lewis states. The check-off agreement covers the collection of special assessments as well, and these in the soft-coal fields have amounted to many times that sum from each man over considerable periods, not for the payment of checkweighman's and union official's salaries and beneficiary payments for miners' families, but for the international organization with which to fight in organizing non-union fields and defending law suits and criminal proceedings, as at Herrin. By collecting the check-off, in amounts as ordered by the union, the operators are handing to the union the sinews of war with which to fight them.

There is no reason why the hard-coal operators should begin the practice now. To refuse it is not a denial of the right to organize. It is not a question of dealing with a union for they do already deal with it in all respects. It is a matter of principle and of policy. The check-off denies to any man the right to work in the coal mines unless he joins the union, and thereby is in violation of the principle that every man should have the unquestioned right to work without joining a union.

The practical operation of extending the check-off to the hard-coal region will be to still further extend the power of the United Mine Worker without in the least adding to its usefulness. Perhaps if the American public would understand and express itself on this as a matter of policy, the issue would not long be obscured or the result in doubt.

LOOKS AS IF CONGRESS is getting ready for a Bloc party.—*Brooklyn Eagle*.

Psychology for the Coal Merchant

PROBLEMS of retail and wholesale distribution will be studied by secretaries of commercial organizations and trade associations at the coming meeting of the National School for Commercial and Trade Executives at Northwestern University in the last half of August. This institution, fostered by the Chamber of Commerce of the United States, seeks to spread the knowledge of sound practice in merchandising and distribution—literally to make better merchants. It is inviting all who may be interested to attend this meeting. Among other matters to be considered are ways and means of accurately surveying the wholesale and purchasing power and capacity of towns and cities. It is not announced that coal will be specifically covered, but it should be.

Retail coal merchants know only too well that their line does not stand as high in the estimation of the public or in the scale of merchandising as most other local enterprises. Coal as a necessity is not sold, it is bought. It is a commodity the retail end of whose distribution is too generally a "come and get it" business. The coal merchant's office more generally than not is a small, dark coop—dirty, dusty, uninviting. Sensing the distrust of the buyer, the dealer, from behind his partition, more forbidding than that of a bank president, armors himself with a frown and growl to forestall the complaints or worse of the customer who risks entrance. The meeting at Northwestern University will give a course in salesmanship and another in psychology that might with advantage be extended to cover the coal trade.

A course in economics such as will be given there would further enlighten the local merchant why business often is so poor. There are too many in the game too poorly financed. The retail coal trade is as overdeveloped as the soft-coal producing industry, and for the same specific reasons. The exceptions to the general run prove the possibilities of what have come in general business to be accepted as sound merchandising practice and it is to be hoped that secretaries of local and other retail coal merchants' associations will participate in the coming sessions of the National School for Commercial and Trade Executives. The coal industry as a whole will benefit by the strengthening of this link between the mine and the consumer—not that the other links are as strong as they might be.

SETTLING A COAL CONTRACT DISPUTE FOR FIVE DOLLARS in a court of law is a happy experience in economics that probably no coal man ever had. Even if only a single car of coal worth \$150 is involved, the cost of litigation mounts to a figure sometimes out of all proportion to the value of the goods. The result is that many a coal shipper takes a crooked deal from a buyer, charges his loss to experience, and remains out of court. But if an arbitration clause were written into every coal contract and a working system of arbitration were set up in the coal industry there is no reason to suppose that costs would be much, if any, greater than the costs in the Commerce Court now settling business arguments in Chicago. There the scale is \$5 where the matter in contest does not exceed \$200; \$7.50 from \$200 to \$1,000, and \$10 from \$1,000 up plus 1 per cent or 1½ per cent per \$1,000 above the first \$1,000. This is cheap justice.

From Coke Oven to Byproduct Market, Rosedale Refinery

Decanting the Tar—Taking Ammonia and Benzol from the Gas—Adding Ammonia to Sulphuric Acid to Make Ammonium Sulphate

BY G. A. RICHARDSON*
Philadelphia, Pa.

Hydraulic Main

Sulphate Storage

AT THE Rosedale plant of the Cambria Steel Co., near Johnstown, Pa., the byproduct-recovery equipment is as follows:

- | | |
|--|---------------------------------|
| 4 Primary coolers | 3 Acid separators |
| 4 Exhausters | 1 Ammonia still |
| | (for weak NH_3 liquor) |
| 2 Gas boosters; one, being inter-changeable, can be used as an exhauster | 3 Final coolers |
| 3 Tar extractors | 3 Absorbers |
| 3 Saturators | 1 Gas holder |
| | 3 Light-oil stills |

At Rosedale the practice is to use all the ammonia produced by the coke ovens for the manufacture of ammonium sulphate, condensing apparatus not having been installed. Room has been provided for it, however, and the procedure, if a plant were supplied, would be the same as that followed at the Franklin plant, which will be described later. Light oil is refined at Franklin, and all that produced at Rosedale is shipped to that plant.

The gas from the ovens enters a drum immediately above them. Here it is brought in contact with a spray of weak ammonia or byproduct-house liquor which washes out a large part of the tar. The gas and liquor then flows across through collector mains into the common foul-gas, or suction, main. Where room permits, the tarry liquor is bypassed into the bottom of the common main with the aid of a butterfly valve. The reason for this is that the water, etc., coming over and into the top of the main with the gas, tends to disturb the suc-

tion. Owing to lack of headroom, the two leads at the upper end of the batteries do not have this bypass.

The common foul-gas main slopes downward toward the primary coolers, increasing in size by sections until it attains a maximum diameter of 78 in. Diaphragm expansion joints are provided, and bleeder valves are placed at various points along the main to take care of excess tar water in case the main should clog.

A tar valve, located close by the primary coolers, is used to drain the tar water from the main into the decanters. These latter are rectangular tanks. By the side of the decanter is a liquor-collecting tank and a tar-collecting tank, both cylindrical.

The weak liquor coming back from the ovens has been increased in volume about 6 to 7 per cent by the moisture in the coal. From the liquor-collecting tank weak liquor is sent back to the ovens, and again sprayed into the mains. Any excess passes off over a weir and is sent to the weak-liquor decanter, where any tar that is still left in it settles and is taken to the dehydrator. The excess weak liquor is pumped to collector tanks and thence to the storage tanks.

The tar overflows from the tar-collecting tank into the tar dehydrator, where steam coils drive off the moisture. From the dehydrator it is pumped into the storage tank, which is in the same group as the liquor tanks. Much of this is used for fuel in the various parts of the steel works and the surplus remaining is sold in the market. No attempt is made to refine it at this place.

Gas from the foul-gas main passes first into the primary coolers. There are four of these connected in parallel. They are filled with wooden grids. Weak

NOTE—This is the fifth of a series of six articles on the mines, ovens and byproduct refineries of the Cambria Steel Co. Earlier articles appeared Aug. 31 and Sept. 7, 1922, Feb. 15 and July 19, 1923.

*Midvale Steel & Ordnance Co. and Cambria Steel Co. Since this article was received these two companies have merged with the Bethlehem Steel Co.

FIG. 1
Rosedale Byproduct Plant

The gas comes to plant in the foul-gas main with water and tar. The treatment consists in separating the ammonia liquor, the tar and the gas and from the ammonia liquor to make ammonium sulphate, and in removing the benzol from the gas.

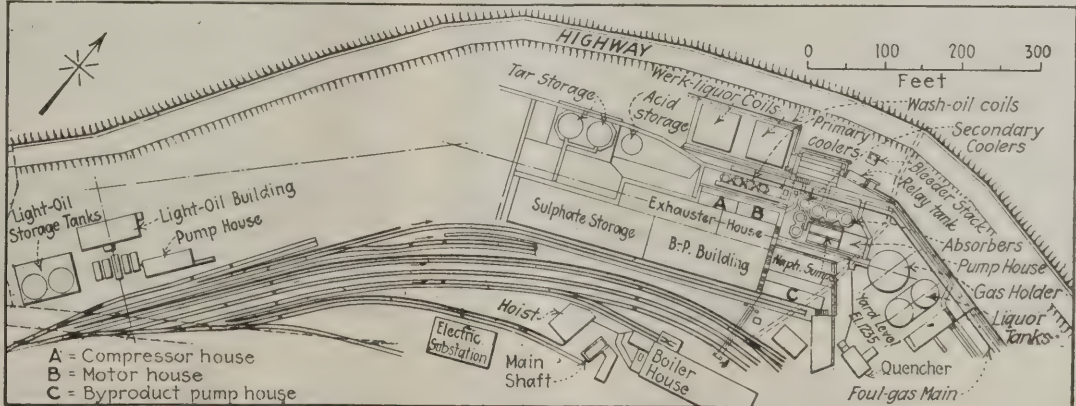

FIG. 2

Panorama of Plant

A shows the four primary coolers; B, one of the final coolers; C, the three absorbers; D, two tar storage tanks; G, one acid storage tank; H, the gas tank; I, the liquor tanks; K, the boiler house; M, the quenching tower; N, the new Hinckston roadway and O, the byproduct building.

ammonia liquor trickles down from the top and washes the excess tar out of the ascending gas and at the same time reduces its temperature. Practically all the tar and naphthalene are separated out in the process. When all the ovens are operating at least three of the coolers are required.

The tar drops down into a reservoir at the base of the coolers, any excess overflowing and draining to the decanters. The circulation of the liquor is continuous. After passing down through the coolers it is pumped back into cooling coils which are sprayed with water, and thence it passes back to the coolers again. There are 120 stacks of 2-in. coils each 30 pipes high.

The Solvay people make the statement that "due to the difference in rate of heat transfer through metals from water to water and from gas to water the efficiency of the Semet-Solvay coolers is approximately 50 times that of the old type of tubular coolers. It also is of interest to note the well-demonstrated facts that under normal operation these grid-type coolers never require cleaning and that during the entire life of the plant there are no repair costs other than occasional renewals of spray nozzles."

When the gas leaves the ovens it has an average tem-

perature of 600 deg. C. It enters the collector mains at about 400 deg. C. and enters the suction main at about 200 deg. C. When it enters the coolers it has lowered in temperature to about 70 deg. C., and in the coolers it is reduced to about 30 deg. C. About 70 per cent of the tar is condensed in the collector mains, 20 per cent in the suction main and about 8 per cent, consisting, of course, of the lighter tars and watery vapors is collected in the primary coolers. Some naphthalene also is condensed at the same time.

To draw the gas through the primary coolers requires a suction of about 130 mm., or 5 in. For this purpose four exhausters are used which are located just beyond the coolers, in a bay of the sulphate building. There also are two blowers, one of which can be used either as a booster or as an exhauster. The exhausters each have a capacity of 83.4 cu.ft. per revolution. Two are driven by 300-hp. motors and two by 15x22-in. steam engines. A bypass with a butterfly valve is used to regulate the suction. Although this is not the most economical method it is the most satisfactory.

From the exhausters the gas passes through three 22,000,000-cu.ft. capacity tar extractors. In these the gas passes through a screen and impinges on flat sur-

FIG. 3—TAR VALVE REMOVES TAR WATER FROM MAIN

A tar valve located close by the primary coolers is used to drain the tar water from the foul-gas main, the diameter of which at this point is 6 ft. 6 in. The tar water thus leaving the main passes to the decanters.

FIG. 4—DECANTERS AND TANK TO HOLD WEAK LIQUOR

In the decanter the weak liquor is separated in a degree from the tar, cylindrical tanks being provided for the reception of both. The weak liquor thus partly purged of its tar is sent back to the ovens to speed the sluggish material in the hydraulic main.

FIG. 5—TAR DEHYDRATOR FOR EVAPORATING WATER

Here steam coils drive off the moisture which went with the tar instead of segregating with the weak liquor. From this point the tar is pumped into one of the storage tanks, two of which can be seen in the plan that accompanies this article.

faces, the tar dropping to the bottom and going direct to the decanters.

The gas itself goes to three ammonia separators, where it enters at the bottom and bubbles up through a bath of sulphuric acid (5 per cent solution). In the resulting reaction ammonium sulphate, $(\text{NH}_4)_2\text{SO}_4$, is formed. The gas passes on to acid separators which contain a series of baffles that cause a mechanical precipitation of the acid which has been carried over with the gas.

After the acid bath has become saturated, crystals of ammonium sulphate fall to the bottom and are thrown out with an air ejector to draining tables in which liquid seals are provided to prevent spattering. The mother liquor overflows and is returned to the saturator.

FIG. 6—IN FOREGROUND, FOUR PRIMARY COOLERS

The gas from the foul-gas main passes in parallel from the bottom to the top of these coolers. They are filled with wooden grids. Weak ammonia liquor trickles down from the top and washes excess tar out of the ascending gas. The tar and naphthalene are practically removed, for the temperature is greatly reduced. In the rear are the scrubbers. Note the pipes by which the gas goes in and, on the extreme right, one of the pipes by which the purged gas is withdrawn.

At regular intervals the salt is paddled into centrifugal driers, where it falls into a wire cage and is whirled rapidly.

After the salt has been partly dried it is washed with water, which removes the free acid, the usual practice at Rosedale being to get down to 0.05 per cent moisture. Care is necessary in washing to avoid giving an excess bath to the sulphate. Uniformity in the supply of water

is assured by using a one-gallon tank of water, which is blown into the drier. The drying time is about fifteen minutes. Nine driers are available, there being three for each saturator.

A belt conveyor carries the sulphate, thus dried, to

FIG. 7—ANOTHER VIEW OF PRIMARY COOLERS

On the left can be seen the weak-liquor cooling coils and the wash-oil coils. In the middle foreground are the primary coolers (four of them), the top of the scrubbers and the secondary coolers. On the right is the sulphate building.

the sulphate-storage building, which is 176 ft. long by 56 ft. wide and has room for 4,000 tons. The salt is then bagged or loaded into railroad cars in bulk according to requirements.

A feature of the Semet-Solvay system is that ammonia begins to be separated at the collector or hydraulic main, for the liquor which is sprayed at this point, gathers up much of the ammonia and so relieves to a certain extent the load on the coolers and prevents pitch from being deposited in the main. At the same time the fixed ammonia salts are removed. Inasmuch as the overflow from the primary cooler system is returned to the hydraulic-main circulation, it is evident that the overflow from this latter system will contain all the fixed ammonia and but little free ammonia. This, in turn, reduces to a minimum the volume of weak liquor requiring distillation and lowers the cost of ammonia recovery when sulphate is the product desired.

The weak liquor from the storage tanks is brought to a 6-ft. ammonia-tank still, which is large enough to

FIG. 8—COILS THAT COOL WASH OIL AND WEAK LIQUOR

The weak-liquor cooling coils are in the right rear. They lower the temperature of the weak liquor so that when it is admitted to the top of the primary coolers it will reduce the temperature of the gas and cause it to discharge its tar and naphthalene. It keeps circulating between the cooling coils and the primary coolers on the left. In the foreground are the wash-oil cooling coils, with the scrubbers on the left.

FIG. 9—COOLING COILS FOR PRIMARY COOLERS

On the left can be seen the three tall light-oil absorber towers, two low secondary coolers and in the middle rearground the four primary coolers. In the right rearground is the coal-hoisting shaft.

meet all requirements. The liquor enters a tank at the top of the still and passes down through coils in which it is preheated. From this point it passes through a lime reservoir, where it is mixed with milk of lime and again returned to the still, which it enters at a temperature of about 80 to 85 deg. C.

The mixture then flows downward over a series of superimposed trays and at the same time meets an ascending current of steam. Suitable baffling devices in each tray insure an intimate and efficient contact between the liquor and the steam. The steam liberates the free ammonia and the lime frees the "fixed" ammonia. The ammonia goes back into the saturators together with the gas from the exhausters. The excess lime and condensed steam leave the still at the bottom as "spent liquor," which goes to the quenching system at the ovens, as it cannot be run into the river.

We will now come back again to the consideration of the gas. After leaving the acid separators it passes through three final coolers which are arranged in series. These are of the same construction as the primary coolers, but water is used instead of weak liquor for cooling. This reduces the temperature of the gas to about 20 deg. C.

FIG. 10—WASH OIL AND WEAK LIQUOR PUMPS

Centrifugal pumps and their motors, the former being driven through gears. Enough weak liquor has to be passed through the cooling coils and primary coolers to reduce the temperature of the gas in the latter from about 70 deg. to about 30 deg.

FIG. 11—TAR EXTRACTOR AND SULPHATE SATURATOR

Even after passing through the primary coolers the gas contains tar; consequently in the tar extractor it is passed through a screen and allowed to impinge on a flat surface. As a result the tar is still further removed. The gas then goes to the saturator.

The water, after circulating through the grids, runs into a sump where the small quantity of naphthalene remaining in the gas is deposited and collected, and the water is then pumped under a 200-ft. head to a spray pond located on the side of the hill at a point about 110 ft. above the plant. From this point it returns by gravity to the top of the final coolers. Tests on this spray pond made on favorable days have shown that the water is cooled to a temperature 3 deg. C. below that of the atmosphere.

From the final coolers the gas passes to the scrubbers or absorbers, which are of the same general construction and have a diameter of 16 ft. and a height of 90 ft. Straw oil, which is a light petroleum oil of high boiling point, descends through the scrubbers and meets the gas. The scrubbers are connected in series, two being used at a time and a third being held in reserve.

The gas goes in at the bottom of No. 1 scrubber and rises to the top. It is then taken to the bottom of No. 2 scrubber. The fresh oil, on the other hand, is taken in at the top of the No. 2 scrubber, falls to the bottom, and is raised to the top of No. 1 scrubber. Thus the gas and oil travel in opposite directions, the benzol and its homologues being absorbed by the oil in the process.

FIG. 12—DRAIN TABLE AND CENTRIFUGAL DRIER

Crystals of ammonium sulphate which fall in the saturator are thrown out by an air ejector onto draining tables. The liquid mixed with the crystals overflows and is returned to the saturator. At regular intervals the salt is paddled into the centrifugal driers

FIG. 13—AMMONIA STILL IN SULPHATE BUILDING

The saturators are fed only with "free ammonia" and sulphuric acid. The weak liquor of the primary coolers is mostly water with fixed ammonia, for conditions are favorable for the escape with the gas of whatever free ammonia may be present. To free the ammonia in the weak liquor the latter is run into the still at the top, passes down through heated coils and is circulated through a lime reservoir, where it is mixed with milk of lime. Returning to the still it falls over a series of superimposed trays, meeting on its way an ascending current of steam. The steam liberates the free ammonia, and the lime frees the fixed ammonia. The ammonia is then taken to the saturator.

When the wash oil comes from the wash-oil collector tank it is pumped into a wash-oil cooler, where it is cooled to about 22 to 24 deg. C. By having the flow of oil and gas come from opposite ends the fresh oil comes in contact with the leanest gas at a time when its absorbing powers are greatest. According to whether the oil is just entering, is part way or all the way through, it

is known as debenzolized, partly benzolized or benzolized oil respectively.

Thus, 90 to 96 per cent of all the benzol vapors are extracted from the gas, and the oil has a saturation of $2\frac{1}{2}$ to 3 per cent of benzol and its homologues. An important consideration is the quality of the wash oil, and periodical tests are made to insure that the desired standard is maintained. A portion of the oil is re-

FIG. 14—SATURATOR FLOOR IN SULPHATE BUILDING

This shows the saturator on the left, the tar extractor in the middle and the ammonia still on the right.

moved from circulation from time to time and replaced by fresh oil, as it has a tendency to thicken, which causes a deterioration in its absorbing powers. There is an average loss of 5 gallons of wash oil per 100 gallons of light oil produced.

The benzolized oil is pumped to the light-oil plant from light-oil absorber No. 1. Here a continuous process of distillation is used with enclosed and open steam

FIG. 15

Sulphate Building

On the right can be seen the tar extractors and separators and on the mezzanine floor the centrifugal driers, which remove the surplus acid from the sulphate. Each saturator has three driers. There are therefore nine driers to match the three saturators. Water is added during the drying process to remove still further the acid which adheres to the sulphate.

FIG. 16—FINAL COOLERS AND ABSORBERS

The final coolers bring the gas down to 20 deg. C. They are like the primary coolers but they use water instead of weak liquor and this water is cooled in a spray pond. The gas then goes to the scrubbers or absorbers, which it goes through in series, in contradistinction to the practice with coolers. Straw oil is used in place of water, the fresh oil entering where the gas leaves and leaving where the gas enters, so that the unsatisfied oil meets gas that has been almost deprived of its benzol and the almost saturated oil meets gas that has a maximum of benzol.

as the heating agent. The oil first enters an oil-to-oil heat exchanger, where it is raised in temperature about 10 deg. C. Then it passes into a tubular preheater, where it circulates through coils in indirect contact with steam which is forced into the top of the preheater and raises the temperature of the benzolized oil to about 130 deg. C. From the top of the preheater the oil is run off into the light-oil stills.

There are three stripping stills, which have been made of ample capacity to meet all needs. These are 6 ft. in diameter and have a capacity of 20,000 gallons per hour. They are divided into two parts, the lower being the stripping and the upper the fractionating section. Live steam is forced into the bottom of the still and separates the light oil from the straw oil in the form of vapor which rises to the upper section, where water is introduced direct to cool it to 100 deg. C. This removes any heavy oil that might be carried over.

The straw oil flows by gravity to the bottom of the

FIG. 17—SPRAY POND FOR FINAL COOLERS

Water, unlike weak liquor, can be cooled in the open air and consequently is more effectually cooled and more effective as a cooler. The pond is 110 ft. above the plant, and the water is pumped up at a 200-ft. head.

still, from which point it is taken to the decanter. Water from the light oil also comes to the decanter. The straw oil is separated from the water at this place and runs back to the wash-oil collector tank, where it is then ready to be used again. The water is pumped to a spray pond for cooling and is then of low enough temperature for pumping back into the top of the light-oil still.

The vaporized light oil passes out of the still into condenser coils, from which the resultant mixture of light oil and water goes to the light-oil separator. In the separator the water is siphoned from the bottom and sent back to the light-oil decanter, and the light oil, which is known as crude light oil at this stage, goes to the light-oil receiving tanks to be measured, and thence to the light-oil storage plant. As no provision is made for further treatment at Rosedale the crude light oil is shipped to the Franklin plant, which will be described later.

The Solvay people claim a high heat efficiency in their light-oil separating system and also emphasize the fact that the separation of light oil and absorbing oil is so complete that the light oil needs no intermediate redistillation before being worked up into motor fuel or pure benzol, toluol and solvent.

The gas from the scrubbers has had all the byproducts removed and is ready for distribution as fuel gas. All of it goes to the gas holders and from these the gas

FIG. 18—SULPHATE OF AMMONIA IN STORAGE

This salt is readily handled by small portable conveyors, part of one of which can be seen in the right corner of the photograph.

required for the ovens is drawn, the excess gas being pumped to the steel mills by "boosters." About 30 to 35 per cent of the gas is used for the ovens. The remainder is pumped to the mills with the aid of two 150-cu.ft. exhausters, each driven by a 425-hp. twin engine. The surplus gas, estimated at 25 million cubic feet per day, will replace in the mills approximately 500 tons of coal, or 100,000 gallons of fuel oil, or 13,000,000 cu.ft. of natural gas, or 100,000,000 cu.ft. of producer gas.

Some of the auxiliary equipment at Rosedale is of interest. The boiler house contains three 768-hp. water-tube boilers, each of which is equipped with a chain-grate stoker for burning coke breeze. The boiler plant is provided with a track hopper, elevator, crusher, belt distributor and fuel bins for handling either breeze or coal. Ashes are removed by a traveling bucket and skip hoist.

Two air compressors, each direct-connected to a 225-

Indo-China Has Many Strippings In Coal 100 Ft. Thick

Excellent Anthracite and Low-Volatile
Bituminous in Lower Beds and Lignite
in Upper—Add Japanese Coal for Coke

THE production of the coal mines of Indo-China has been steadily growing since 1906, when the production was 2,297 net tons. In 1920 it was 770,000 tons and in 1921 it had reached 1,013,000 tons, showing a remarkable contrast with the mines producing non-combustible minerals. The production of these commenced to decrease in 1916, when the output was 55,770 tons; in 1921 it had fallen to 13,178 tons. The demand for coal, says *L'Indochine Minière* a publication of *La Vie Technique Industrielle, Agricole et*

hp. motor and having a combined capacity of 2,000 cu.ft. of free air per minute, take care of the various needs of the plant.

The main source of power throughout the plant is electrical, more than three hundred motors of various kinds being in operation. The current is generated in the steel company's power house and brought to the Rosedale transformer station in which there are (1) two 500-kw. 250-volt direct-current motor-generator sets and one 500-kw. 275-volt synchronous converter for supplying the direct current required, (2) three 1,000-kva. transformers for taking care of the alternating-current requirements.

The method of unloading and storing acid is of interest. The acid is blown from the tank car with the aid of compressed air into a tank of the same capacity. From this tank it passes into a small high-pressure tank of about 800-gallons capacity from which it is forced up into the main storage tank.

Every attention has been paid to making the plant as safe and satisfactory to work in as possible.

Coloniale, to which we are indebted for the information which follows, is steady and rapidly increasing.

Of the five divisions (*pays*) of the Indo-Chinese Union, Tonkin has been the most completely explored and appears actually to be the richest in mines of all sorts. The workmen are mostly Anamese from the delta plains and Chinese. The mountain peoples supply coolies, but they are little inclined to work steadily. They are above all useful to prospectors when making their examinations of the lands to be developed. The wages paid are roughly 50c. a day to Chinese, 35c. a day for Anamese and 27c. a day to native women.

The principal coal basin, which is of the Rhaetian (or Upper Trias) sub-era, a part of the secondary or Mesozoic period, was first mined in 1884. It contains low-volatile, almost anthracitic, coal (*charbon maigre*) and lies in the arc of a circle 112 miles long, extending from Moncav in the east to the Seven Pagodas in the

Monplanet Stripping

Note the various tramming levels and the inclined roadways from level to level up which coolies can travel, also the long inclines running under the various levels. Do not fail to observe that in the rear is another stripping of like character. Judging by the relation of the pit to the sloping surface of the ground the work is only just barely commenced. The Hatou and Campha strippings are equally impressive. Monplanet is one of the collieries of Hongay.

west. The usual proximate analysis will run: Volatile matter, 8 to 12 per cent; ash, 2½ to 7 per cent; fixed carbon, 87 to 88 per cent and sulphur, less than 1 per cent. The calorific power of the fuel will run from 12,600 to 15,120 B.t.u.

It is an excellent fuel that burns without smoke and produces no clinker. With the aid of forced draft it can be used without admixture for boiler furnaces even as mine-run or in a case of necessity as nut coal. Mixed with a high-volatile coal it becomes a good steaming fuel which can be burned by locomotives and sea-going

boats of 110 tons burden, being brought down the streams from the principal mines. The freightage costs 73c. per net ton. More than half the coal is exported, the points of shipment being Hongkong, Japan, China and the Far East.

The largest producer is the *Société Française des Charbonnages du Tonkin*, which mined at Hongay in 1921 792,000 net tons. These mines were worked by the Chinese in 1865. The beds discovered appear to group themselves in two series, those of Hatou and of Nagotna. The first consists of four beds, one, the Big

Stock of Briquets

The walls on the right are built of briquetted coal. On the left is a village for natives. This is part of the property of the Hongay Collieries.

vessels. Before the discovery in Tonkin of coal having a larger quantity of volatile matter, Japanese coal was mixed with the anthracite for steam purposes, but today the large navigation companies are beginning to stock their bunkers at Haiphong with a mixture of 60 per cent of the low-volatile coal of Hongay and 40 per cent of the higher volatile coal of other parts of Tonkin.

The mines in that part of the basin which is adjacent to the bay of Along are principally strippings and are close to natural ports accessible to ships of 4,400 to 6,600 tons burden—Hongay, Port Courbet and Port Wallut. The output of the basin in the region of the Dong-Trieu can readily be brought to Haiphong by

Bed, 164 to 197 ft. in total thickness, of which about 98 ft. is coal. The other beds have a total commercial thickness of 49 ft. The second series has ten beds 3 ft. 3 in. to 19 ft. 8 in. thick.

At Hatou the Big Bed is worked in three strippings, and the coal is transported by a railroad of 3 ft. 3 in. gage. The Big Bed at Campha likewise is stripped and the coal from these pits is transported to Hongay by lighters or junks of 66 to 110 tons weight. The conditions are exceptionally favorable, for this operation is close to the sea. The thickness of the bed is about 492 ft., of which 262 ft. is coal.

At Hongay the coal arriving from different operations

is screened into the following sizes: 0x0.4 in.; 0.4x1.07 in.; 1.07x1.95 in., and larger. The size 0.4x1.07 in. is washed. At the side of the washery is placed a briquet factory which has four presses and has a capacity of 143,000 to 165,000 tons per year. Seventy per cent of Hongay coal and 30 per cent of high-volatile Japanese coal is mixed in the manufacture of these briquets. The briquets are of two kinds—ordinary briquets and those for war vessels.

	Ordinary Briquets Per Cent	Briquets for War Vessels Per Cent
Volatile matter (less moisture).....	17.5 to 18	18 to 18.25
Fixed carbon.....	76 to 77	78 to 81
Sulphur.....	0.90 to 0.95	0.70 to 0.75
Ash.....	7 to 8	5 to 6
Calorific power (B.t.u.).....	13,500 to 13,680	14,130 to 14,580

The factory also has a boulet press which can manufacture 22 tons per shift. A battery of nine coke ovens also is provided. It can produce 27½ to 33 tons of coke per day. It actually produces 1,100 tons a year. The coking mixture is 30 per cent of Hongay coal and 60 per cent (?) of Japanese high-volatile coal. The *Société des Charbonnages du Tonkin* employs 800 Chinese and 7,000 Anamese, but it is estimated that the Hongay mines support a population of about 40,000 natives, including the families of workmen and traders. [Probably this 7,800 men includes the lightermen. It is interesting to notice that these men produce in a year

792,000 tons yearly, or 102 tons per man per year, which, under the favorable conditions is a small quantity, even for Oriental labor.]

Other mines are those of Dong-Trieu. Here are ten beds, of which four are worked. The coal has a usable thickness of 49 ft. to 65 ft. and is of hard anthracite, containing 3 per cent of volatile matter. At Phan-Me is a coal averaging 22 per cent volatile matter, 18 per cent ash and 1 to 1½ per cent of sulphur. It is an excellent combustible, mixing well with the dry coal to make a light and strong coke which has been proved suitable for metallurgical uses. In the basin of Phu-Nho-Quan et Chine is a coal consisting of 20 per cent volatile matter, 7.5 per cent ash and 4.2 per cent sulphur.

Not only is there Upper Trias coal but some that is of Tertiary age. This is lignite. That from the Tuyen-Quang mine has 35 to 40 per cent of volatile matter, 12 per cent of ash and 1.5 to 2 per cent sulphur. At Dong-Giao this Tertiary coal is 29½ ft. thick and at Tuyen-Quang only 8½ ft. thick.

With zinc, tin, tungsten, copper, iron, gold in quartz and placer workings, mercury, phosphate of lime, graphite and sapphires in Indo-China to furnish a market what more could a coal man wish, especially as at present an operator apparently is looked upon as a benefactor and not as someone to be tolerated, unduly taxed and closely regulated.

Disastrous Inflammation of Coal Dust In Excavating a Mine Dump

BY C. A. HERBERT

Mining engineer, U. S. Bureau of Mines

WITHIN the past three years two very serious accidents, under almost identical circumstances, have occurred on the surface at two different coal mines in southeastern Iowa, due in each case to the sudden ignition of a cloud of fine coal dust. The first accident resulted in the burning of six men, three of them fatally; the second burned eleven, three men dying as a result of their burns.

The mines in the southeastern part of Iowa, where these two disasters occurred, are operating in a coal bed the thickness of which averages about 3 ft. They are worked on a longwall advancing system similar to that of northern Illinois.

The miners in this section are paid on a screened-coal basis; in other words, they receive no pay for the fine coal. As a result they use forks in loading the coal into the mine cars, and naturally much coal is left along the roadways. Subsequently this fine coal, together with the roof rock that is taken down to give sufficient height on the roadways, is loaded into cars and dumped in piles on the surface. This roof rock is a black, oily shale, and the combination of fine coal and oil shale gives ample combustible. Consequently the dump pile when it catches fire burns the rock thoroughly as it is dumped. These rock piles, or dirt piles, as they are called, take fire spontaneously and continue to burn as long as fresh material is dumped on them.

This rock, after having burned itself out, makes an excellent material for road building and also for railway track ballast. Because of this latter fact the railroads serving these mines were in each instance loading out the burned material from the side of the rock pile with a steam shovel. Having cleaned up all the loose material along the side of the pile next to the track, leaving a

nearly perpendicular face, shots were placed in this straight face to bring down additional material for the shovel. In each case a slide took place following the dynamite shots. These slides brought down with them a large quantity of the recently dumped and as yet unburned fine coal from the top of the dump; this fine coal being light, naturally separated from the heavier rock material and thus formed a dust cloud.

As some of this fine coal was already burning along the outside of the pile where the air could get to it and all of it was heated nearly to the ignition point, it was in just the right condition to flash into flame as soon as it was thrown into the air. The combined force of the slide and the rapid burning of the fine coal threw this burning dust cloud several hundred feet from the foot of the rock pile and across the railway tracks, burning those who were unfortunate enough to be in its path.

In the latter accident the steam-shovel crew saw the slide take place and shut themselves in the steam-shovel cab to escape what they thought was a dust cloud, and thus escaped injury. The others who escaped were those who were fortunate enough to have run in a direction at right angles to the path of the flame.

One of the lessons learned from the study of dust explosions in coal mines is to keep the dust thoroughly moistened at the point where ignition is likely to occur. This acts in two ways to prevent a serious inflammation of the dust: First, the water tends to compact and bind the dust and prevent dust clouds from forming, and second, if sufficient water is added it will cool the flame of any incipient inflammation sufficiently to extinguish it.

With the above lesson in mind it would be advisable for the railway companies engaged in loading up these old dirt dumps to thoroughly wet down the freshly dumped combustible material at the top of the dump for several days prior to its being disturbed. This could be done best by using fire hose with a pipe 5 or 6 ft. long for a nozzle, which should be forced down into the material on the top of the dump to make sure that the water reaches below the surface of the heated material.

Testing Lightning Arresters and Important Features of Design and Construction

Equipment for Laboratory Testing—Properly Interpreting Laboratory Results—Use of High-Frequency Oscillator for Tests—High-Powered Condenser Discharge—Importance of Wave Form

BY V. E. GOODWIN

General Electric Co., Pittsfield, Mass.

OCCASIONALLY users of lightning arresters think it advisable to make laboratory tests on lightning arresters. In the case of a new type of arrester there may be a laudable desire on the part of a prospective user to determine the characteristics of the arrester, but whatever the motive, few if any companies could economically afford to maintain or have the equipment and technique to make the tests, or the knowledge to properly interpret the results. Years of experience with arresters in service and in the laboratory are necessary to understand and interpret the relationship between results in service and results in the laboratory.

The testing of a well-established arrester, like the compression chamber or oxide film arrester, is simply a waste of time, not only for the reasons just given but also because service tests, which if properly made are better than laboratory tests, have already demonstrated the effectiveness of the arrester.

In order that the problem of testing arresters may be better understood, and hence a waste of time and money avoided, it may be interesting to outline several of the methods employed in the laboratory, and the difficulties encountered.

VARIETY OF PARTS TESTED BY ELECTRICITY

Routine factory testing consists in testing insulators, bushings and other insulations to make sure that they have the necessary dielectric and flashover characteristics, and that they meet the specifications of the American Institute's standardization rules. All chemicals and compounds are given special electrical and chemical tests. Completed parts, like the oxide film cell, and, where necessary, arresters, like the compression chamber arrester, are electrically tested to determine whether the device has been properly assembled. Such tests simply insure that the product is in accordance with the ideas of the designers.

In research and development work, models of the proposed designs are tested according to certain standards established by experience. Fundamentally, the arrester must protect apparatus against lightning disturbances and must do so without being itself damaged or causing an interruption to service. It is not always appreciated that it is extremely easy to make a device that will protect, that it is extremely easy to make one that will be safe against self-destruction and that will not interrupt service, but that it is extremely difficult to make one that will combine both characteristics. More in detail, the arrester is tested to determine the following characteristics:

(1) *Sensitiveness*.—This determines at what value of the abnormal voltage the discharge begins. It is a function of the gap setting, and of the shape and material of the gap electrodes. The last two determine the "speed"

of the gap—that is, the dielectric spark lag under impulses of steep wave front.

(2) *Discharge Rate*.—Probably the most important characteristic. It is largely a function of the internal impedance of the arrester. It is a measure of the arrester's ability to discharge quickly large quantities of electricity.

(3) *Reseal*.—This is a measure of the recovery of the arrester after the passage of the lightning discharge. The line current that follows the lightning current might damage the arrester, and hence it must be interrupted in two or three cycles or less. It is a function of the principle on which the design of the arrester is based, as oxide film cells, aluminum cell, multigap, magnetic blowout, solenoid, or other mechanical means. In this character is also included the ability of the arrester to withstand quickly recurring disturbances. It also determines whether the arrester will function without causing such a large current to flow as to trip circuit breakers or interrupt service.

(4) *Life and Endurance*.—Tests are made to show whether the arresters will have a life comparable with that of other electrical apparatus.

In making laboratory tests it is kept in mind that a lightning arrester is a device for handling transients of short duration. These are superimposed on the normal voltage of the system and their duration is measured in micro-seconds (millionth of a second). When making laboratory tests, and also in service, the dynamic (generator or line) voltage never should exceed the normal rating of the arrester, as otherwise the cells or similar parts may be instantly damaged. Sometimes in making tests, double dynamic or some intermediate voltage is applied while a fuse is blown, but this is only done to get an idea of the current rate at which a transient or similar voltage would be discharged as the oscillograph is not fast enough to record transient currents of the speed of lightning. This, however, is not an operating condition and the tester is not alarmed even if the parts of the arrester are impaired by the test.

Another point kept in mind in making tests of this nature is that transient voltages occur across any arrester during the time it is discharging. These are due to several conditions which will be discussed later, but the point is the fact that they may or may not be detrimental. The function of the arrester is to protect the insulation of that part of the system adjacent to the arrester. This insulation is tested at 60 cycles for a period varying from 30 seconds to 5 minutes. This test is applied between terminals or between line and ground. Under transient voltages the conditions are quite different. This same insulation may safely stand four or even ten times as much voltage for this shorter time.

Again, under transient conditions the voltage distribution may be entirely different. Hence, an experi-

menter on lightning arresters should be thoroughly versed in the effect of these transients on the insulation of the apparatus and devices on electric systems. When making tests he should apply transients of various wave fronts to these arresters and at the same time should study their effect on the other apparatus to be used on the system. This is a difficult research problem, and for this reason the General Electric Co. considers it necessary to confirm these tests with two or more years of actual operating experience before putting a new lightning arrester on the general market.

Coming back to the question of transient voltage tests, with an arrester having a series gap there are two transient voltages in which we are interested. Assuming the extreme case of a rectangular voltage wave which has a vertical wave front, we would have the full voltage of the wave impressed upon both arrester and apparatus until the gap sparks over. Where sphere gaps are used this time interval is extremely short. After the gap has sparked the voltage drops to a value depending upon the quantity of electricity in this wave and the internal impedance of the arrester.

INTERNAL RESISTANCE VARIES WITH VOLTAGE

The internal resistance of an arrester of the valve type, like the aluminum or oxide film, is a variable factor, depending upon the applied voltage. It is high for voltages below the critical value and rapidly decreases for higher voltages. Thus for the oxide film arrester it is 10,000 to 40,000 ohms for voltages below the critical value and decreases rapidly to only a fraction of an ohm as the voltage is further increased. The capacitance of the cells also affects the impedance of the cells, and likewise the voltage across the arrester. High capacitance, as a general rule, is a desirable feature, but a gap in series with such cells counteracts or nullifies this quality to a great extent.

Hence, when an arrester discharges, we have first a momentarily high voltage impression until the gaps spark. This is followed by a rapidly decreasing voltage, which, as described, above, depends upon the quantity of electricity in the charge on the line and the internal impedance of the arrester. We find that this latter voltage and the rate at which it decreases is the important factor in the gap types of arresters—speaking of disturbances that may rise to the maximum value and decay to harmlessness in twenty-five micro-seconds or less. The time involved in this decay of voltage should be short so as not to stress the insulation of the system which is in parallel with the arrester. This is where the term “discharge rate” of an arrester comes in. It is a measure of the admittance of the arrester circuit at any selected super-voltage. As a general rule, it is expressed in terms of the instantaneous current which flows through the cells when double normal voltage is applied, as this is the accepted minimum test voltage for electrical apparatus.

The discharge rate of an oxide film or aluminum arrester is 600 amp. or over, and of a 2,500-volt compression chamber about 100 amp. Discharge rates of arresters are taken in various ways. The most common is to apply double voltage sixty cycle for a moment and take an oscillographic record of the current flow. This test is not a duplication of any operating condition, and, as mentioned above, is only made in order to get an accurate current record. Another and more comparable method is to pass transients through the arrester and measure the voltage drop across the arrester by means

of measuring gaps. These transient discharges are obtained by charging a condenser by high voltage, direct current, and discharging it through a circuit containing the cells and variable amounts of resistance and inductance, thus obtaining a range of wave fronts and wave characteristics.

The size of the condenser can be varied to represent the capacity of different electric circuits. The high voltage, direct current, can be obtained from either a static machine or suitable kenetrons. We generally use from 100 to 120 kv. for these tests. The current may be of the order of 10,000 amp. The kenetron testing outfit is described in the *General Electric Review*, November, 1921, by Messrs. Hayden and Lougee. Tests of this kind should be made with condensers of fairly large capacity, as otherwise the power involved in the transient is not comparable at all with heavier lightning conditions on an average circuit. Tests made with small condensers or at lower voltage often give misleading data on the protectability of an arrester.

A common mistake in testing arresters, and particularly in comparing one type with another, is to use a high-frequency oscillator. This device has a place in a lightning arrester testing laboratory, but some experimenters, evidently not thoroughly understanding the phenomena involved, have used the oscillator to demonstrate conditions that could not possibly be attained with such a device. It is easy to obtain any desired voltage with the high-frequency oscillator, but it is not possible to obtain the desired current. Ordinarily, the current will be in the neighborhood of half an ampere and is in the form of recurrent trains of oscillations. With such a low-powered testing device it is not possible to determine the relative speed of gaps or the discharge rates of arresters. With such a test circuit it is easy for an inexperienced

SECTION OF HIGH-VOLTAGE TESTING LABORATORY

Such equipment as this is necessary for the testing of electrical equipment used on high-voltage lines, also to test apparatus for lightning protection. An important attribute of the apparatus used in these tests is that it makes it possible to obtain, discharge and dissipate large amounts of current and electrical energy.

LIGHTNING-ARRESTER TESTING APPARATUS

Studies of the effects produced by transient wave surges of various forms are necessary in making arrester tests. By the use of resistances and impedance the wave forms may be varied over a wide range.

tester to conclude that needle gaps are faster than spheres or to make other equally unscientific deductions.

Referring again to the tests with a high-powered condenser discharge, the discharge rate and protective value of the arrester cells are obtained indirectly by measuring the voltage drop across the cells by means of sphere gaps when the condenser discharges. This test is known as the equivalent-sphere gap or E.S.G. test. The rate of decay of the voltage is the really important factor in this test and is the most difficult factor to determine, as up to present date no reliable instruments have been devised to record accurately the wave form of these short transients. It is desirable to have this rate of decay as rapid as possible and at the same time avoid an oscillation of any great magnitude. The sphere gap is extremely fast and indicates the highest values of equivalent spark gap. Slower gaps also are substituted for the spheres in order to study this rate of decay of voltage during the discharge. Needle gaps are slower than spheres and gaps under oil likewise are slower. Again this decay of voltage is studied by substituting various kinds of insulations for the measuring gaps.

A common error in making E. S. G. tests is to neglect the current capacity of the testing generator. Such tests made with a high-frequency oscillator illustrate this point. The current is so small with respect to what the arrester is called upon to discharge in a lightning disturbance, and the effect of capacity may be so great as to make the results worthless. A measure of the protection afforded is the voltage across the arrester (and hence across the apparatus) when the arrester is discharging, and the voltage can be measured only by putting through the arrester an amount of current that would be comparable with the current during a lightning discharge.

The reseal properties of an arrester are studied by applying normal 60-cycle voltage and superimposing

impulses of different intensities on the circuit. The impulse is timed to occur at a predetermined point in the 60-cycle wave, and the dynamic current flow is recorded by the oscillograph, which also shows the reseal characteristics. The time of a reseal in a high-grade arrester varies from a micro-second to about four-hundredths of a second. In lower grade arresters the reseal is longer, requiring in some cases several seconds.

Life and endurance tests are made in several ways, depending on the type of arrester. In general a 3,000-volt section of an arrester is subjected to condenser discharges from a static machine at a rate of one discharge in fifteen seconds. The equivalent sphere gap of the arrester section is taken from time to time.

Another endurance test is to apply normal sixty cycles to the arrester and superimpose different impulses at definite intervals. These impulses are timed, by means of a synchronous switch, to occur at a specified point in the 60-cycle wave to give the most severe operating conditions and to avoid the otherwise hit-and-miss tests. This point varies for different arresters but lies between 30 deg. and 90 deg. after the voltage passes through zero. Secondary life and endurance tests also are made with surges or recurrent oscillations, in order to study the operation and characteristics of each type of arrester. These tests are not true representations of any line conditions, but are made in the further study of the arrester.

The testing of lightning arresters at first sight seems a simple problem, but the lack of supersensitive instruments for accurately recording wave forms of single impulses makes the problem a very difficult one, and roundabout methods must be employed.

Will Erect Exhibition Mine in England

AT THE British Empire Exhibition, to be held at Wembley, near London, the Mining Association of Great Britain will erect a colliery that will enable the public to realize what a mine is like above and below ground. The director of the mining exhibit is H. M. Crankshaw, who while he was in this country and general manager of the Cranberry Coal Co., a subsidiary of the Lehigh Coal & Navigation Co., was a frequent contributor to *Coal Age* and also to the proceedings of the American Institute of Mining and Metallurgical Engineers.

He writes that he will have a quarter of a mile of underground workings which will show longwall and pillar-and-stall methods of operation with all the general mine equipment such as pumps, haulage, coal cutters and stables. It is said that the exhibit, including the machinery shown, will represent about \$500,000. Arrangements are being made to lower a thousand people per hour into the shaft, which will be 15 ft. in diameter and 40 ft. deep. About twenty persons will be lowered at a time.

The headframe and tippie will be of steel 70 ft. high. It will have all the regular equipment, scales, car hoist, rotary dumps, screens and a washery. A lamp room and a fan also will be installed.

The exhibition will be held in May of next year and has been planned in collaboration with representatives of the Institution of Mining Engineers, the Miners' Federation of Great Britain and the Mines Department. Correspondence should be addressed to H. M. Crankshaw, Director, Mining Exhibit, General Buildings, Aldwych, London, W. C. 2.

New Equipment

Small Coal Auger Bit with Two Reamers

WITHOUT a single bolt to come loose in the hole and cause trouble, the Bache'der & Conner Manufacturing Co., of Decatur, Ill., has devised a coal auger with a central twisted straight-ahead bit and two side reamers, all three about 8 in. long. They slide in a

COAL BIT THAT MAKES SMALL HOLE AND REAMS IT

The small bit leads the way, one reamer then enlarges the hole and the other brings it to standard. The manufacturers are meeting a species of general demand, recently arisen, for small detachable bits that can be carried without adding too noticeably to the miners' burden.

slot in the bit head. The center bit is about 1 in. in the lead of the inner reamer, and the point of this in turn is about $\frac{1}{4}$ in. ahead of the point of the outer reamer. The center bit cuts a small hole ahead, the inner reamer enlarges it to about $1\frac{1}{2}$ in. and then the outer reamer increases its diameter to the size the miner desires up to a 4-in. hole. It is claimed that the auger drills easily and that as the actual cutting bits are small the miner can carry them to the shop in his pocket when he wants them sharpened.

New Oil Circuit Breaker of Unit Type

A NEW oil circuit breaker, the type F-33, in capacities of 400, 600 and 800 amp. at 15,000 volts, has been placed on the market by the Westinghouse Electric & Manufacturing Co. This breaker has an interrupting capacity of 1,900 amperes at its rated voltage and is applicable wherever a breaker of that capacity is needed. It is made in the remote-control form only to conform to the recommendations of the Electric Power Club oil circuit-breaker standard practice rules limiting the service of panel mounting breakers to voltages not exceeding 2,500. A separate pole per frame construction makes it particularly applicable wherever it is desired to have the phases isolated.

The type F-33 breakers are supplied for either manual or electrical automatic or non-automatic operation and in single-, two-, three- or four-pole units. Each pole unit is entirely separate with its own frame, mechanism and tank. The heavy cast-iron framework is arranged for either wall or pipe mounting. The mechanism of the breaker is provided with a toggle which permits the breaker to be adapted readily for upward, downward, or horizontal pull without the use of any additional material. A highly efficient form of wedge and finger contact is used with an auxiliary arcing contact on the moving element. The stationary contact is so shaped and located that different portions of the same contact surface act as the main current-carrying contact and as the arcing contact, thus preventing arcing on the main contact surface. The sheet-steel tanks have all seams lap-welded and are lined with micarta.

The electric operating mechanism has a solenoid with a 3-in. diameter core and consists of a cast-iron frame

TYPE F-33 MANUALLY OPERATED CIRCUIT BREAKER

Frequently four-pole units should be purchased and installed for 3-wire systems. This arrangement makes readily available the spare unit in the event of trouble; a feature of importance where continuity of service is essential.

with spaces for closing and trip coils. The moving core of the closing solenoid pulls the main lever down to the closed position, where it is latched, and the trip coil disengages the latch. The mechanism is provided with springs to make the breaker open more rapidly. A two-pole double-throw auxiliary switch is used for cutting out trip-coil currents and controlling indicating lamps.

Simple Standardized Coal Screen for Use At Thousand-Ton Per Day Plants

LUMP, egg and slack are made in a compact, uncomplicated screen designed and constructed by the Morrow Manufacturing Co., of Wellston, Ohio. It is built on a conservative rating of 125 tons per hour, so that it will serve the purposes of the numerous plants producing 1,000 tons per day or less. It is known as the Morrow Junior.

The feeder hopper in the rear receives the coal, and a reciprocating feeder causes it to flow evenly onto the shaking screen. This screen separates the egg and slack from the lump coal. The latter passes finally over a bar rescreen which takes out all the slack that may remain delivering clean coal to the loading boom or other loading device.

The egg and slack pass through the perforations to a

WHY NOT STANDARDIZE SCREENS AND TIPPLES?

When one would buy an engine for ordinary work one inquires what types are being built on a quantitative basis. Engines, like most other things, are now but rarely custom-made. Screens and tipples, where not unusually large, might equally well be standardized, except, of course, that the approaches to tipples must be fitted to the hill.

lower screen, where, after separation, the egg goes to the third track and the slack to the center, or second, track. The lower screen is provided with two slide valves which may be adjusted to mix all or any part of the egg with the slack, which is loaded on the center track.

In two or three minutes the bar screen in the upper section may be adjusted to permit any size of "big lump" to be loaded, leaving the "depleted run-of-mine," which is loaded on the center track. The "depleted run-of-mine" may be deprived of any or all the egg coal, which may be loaded on the regular egg track. Thus big lump, depleted mine-run and egg can be loaded at the same time. If necessary a rack and pinion or a fly valve can be placed in the hopper so that run-of-mine can be bypassed directly to the railroad car without operating any of the machinery.

Standardization makes it possible to construct these screens inexpensively, and it is asserted that being solid units they absorb most of the vibration, shaking the screen rather than the tipple and making the operation less noisy than is customary with shaker screens. Standard tipple plans have been prepared to go with the screen so as to make it easy to prepare for its reception and to install it.

Grate for Burning Small Sizes of Coal

WITH increased interest in the consumption of pulverized coal many operators and consumers will find it advantageous to consider the adoption of a grate suitable for burning fuel of small size.

The Marion forced-draft grate, made by the Marion Machine, Foundry & Supply Co., of Marion, Ind., is designed to burn all kinds of fine or dusty fuel, such as anthracite culm, coke breeze, bituminous slack, lignite coals or sawdust, or any fuel that is so fine that it cannot be burned on the regular form of grate.

The grate-bar construction is that of a cradle into which is cast the steel-bearing trunnions. The perforated top plates are bolted to these cradles. The top plates are made in sections, using two or more plates to each cradle. These plates are bolted to the cradles and are easily replaced when burned out.

The joints between all the grate bars and the side frames are beveled to fit closely enough so that the fuel cannot sift through into the ashpit.

MARION FORCED DRAFT GRATE

The grates are made up in one or more sections in width, as may be required, and of the proper depth to fit the firebox. The grates may be so arranged that on a long set the front and back sections may be dumped separately.

The grate bar tops are perforated with either $\frac{1}{8}$ -, $\frac{1}{4}$ -, $\frac{3}{8}$ -in. holes, spaced $\frac{1}{2}$ in. apart. This gives an even distribution of the air to all parts of the fuel bed. These holes are so small that the air coming up through them prevents any fuel wasting into the ashpit.

The ashpit is closed, and a forced draft is provided by means of a turbine or steam draft blower installed in the furnace wall. This insures the strong draft necessary to force the air up through the dense fuel bed.

Automatic Mine Car Coupler

THIS device is designed with the idea of efficiently filling the need for a safe automatic coupler. Its inventor, A. J. Baldwin of Pikeville, Ky., asserts that it has more than twice as many good points as it has

FIG. 1—READY TO COUPLE

The model shows the construction details and how the jaws align before coupling.

parts. Briefly some of the advantages are: It will save time, eliminate wrecks, cannot accidentally uncouple, can be released or uncoupled quickly and easily, is adaptable to any car, is rugged in construction, safe and relatively inexpensive.

This new device is called the Bulldog Automatic Mine-Car Coupler. When the cars are bumped together they couple automatically and require no human effort.

Loss of coal is greatly eliminated by this coupling device because the coupler holds the cars closer together and there is less bumping of one car against another, with the attendant loss of coal from the top of the car.

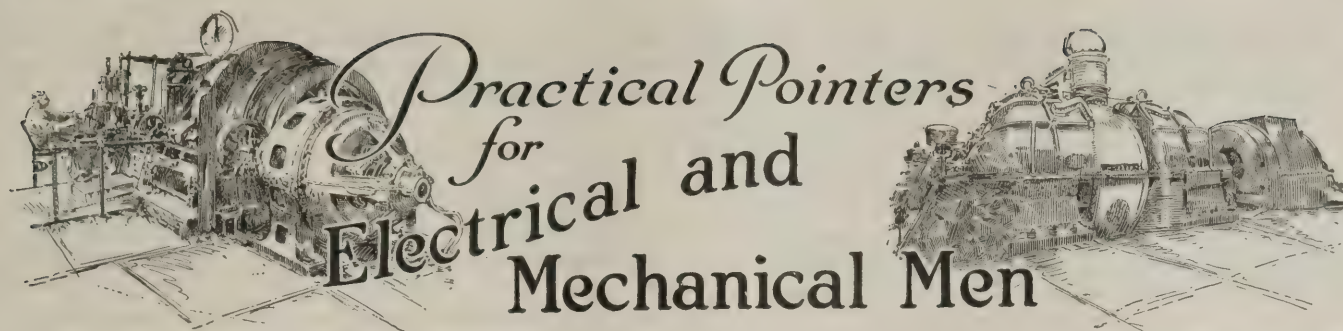

Fig. 1 shows the relative position of the dogs of the

FIG. 2—HOW TO UNCOUPLE

One hand is all that is used in uncoupling and there is no slack space between cars for the workman to be caught and squeezed.

coupler just before they are linked or fastened together. Fig. 2 shows how the coupling may be easily and safely opened with far less danger to the trip runner or dump man than is usual with present-day links and pins.

Testing Polarity of Field Coils

THE object of this test is to determine whether the main and commutating-pole field coils are properly connected. This test should be made whenever field coils are replaced, because coils sometimes are placed over the poles of the frame inverted or reversed, and wrong connections thus made show up in faulty operation of the motor. This test will reveal conditions which might cause an armature to run hot because of an unbalanced magnetic field circuit caused by a reversed main field coil. It also will indicate conditions which might cause poor commutation and flashing in a commutating-pole motor because of a reversed commutating coil.

The following apparatus is required: A polarity detector, such as a small compass; a switch and several sets of grid resistors. A circuit is arranged as shown in Figs. 1 and 2. At least five or six sets of resistors should be put in the circuit at first. If a readable deflection on the polarity indicator is not obtained, part of the grids can be omitted. If one is available, an ammeter in the circuit will indicate whether the current is large enough to be likely to cause damage.

A very satisfactory polarity indicator can be made from a piece of steel banding wire about 3 in. long, with one end bent over about $\frac{1}{4}$ in. to distinguish it. This is suspended at the middle by a short thread. When this is first used it should be held at the pole for at least one minute, when it will become magnetized; then it is ready for use.

The motor can be either on the machine or out on the floor. It can have the armature in or out of the frame, and if it be a split frame, it can be open or closed. With the coils all connected in series, connect the two field leads to the test circuit, as shown in Fig. 1. When the switch is closed, current passes through the field coils, and if they are connected properly, by holding the polarity indicator close to the ends of the coil or to the

FIG. 1—CONNECTIONS FOR TESTING MAIN FIELD COILS

With the main field coils connected in series with a resistance between the trolley and ground the field polarities should alternate as the circuit is followed around the frame.

FIG. 2—TESTING COMMUTATING FIELD POLES

Here the commutating fields are connected in series with a resistance and connected between the trolley and ground while the polarity of the coils is tested.

pole stud bolts on the outside of the frame the polarity indicator will reverse at alternate poles; i.e., if No. 1 pole attracts the positive end of the polarity indicator, No. 2 should attract the negative end, No. 3 the positive end and No. 4 the negative end. If these conditions are not obtained the field winding connections should be changed.

If the frame tested has commutating poles, two separate tests should be made, one on the main field coils, as previously described, and the other on the commutating-pole coils, which is made in the same manner, with connections as shown in Fig. 2. In this case only one of the motor leads (the negative armature lead) can be used, as the other lead from the commutating coils goes to one of the brush-holders. Four-pole railway motors used in mine locomotives with only two commutating coils, which are located directly opposite each other; also four-pole motors with three commutating coils, are tested in the same manner. In the case of the two-pole machine the polarity of both coils should be the same; in the three-pole machine the two coils on diametrically opposite poles should be of the same polarity, while the intervening coil should have the opposite polarity.

In making this test:

(1) Hold the pivoted compass in a horizontal position or the suspended polarity indicator by the free end of the suspension thread.

(2) Test for polarity at the same end of all coils—either the commutator or the pinion end, whichever is more convenient.

(3) Never consider results final until they have been checked the second time, as there is a possibility of the needle of the indicator having its polarity reversed.

(4) It is not necessary that a certain pole have a definite polarity of either + or -, but it is essential that the polarity of adjacent poles be different.

In the case of a commutating-pole machine it is im-

portant to have the proper relation of polarity between the main and commutating field poles. To check this connect the negative (—) armature lead of the motor to the positive (+) field lead, the positive (+) armature lead to the trolley side of the test circuit, and the negative (—) field lead to the ground side of the test circuit, and close the switch. If the armature is in the frame and the brushes are making contact on the commutator, current will flow through all the windings; if the armature is not in the frame, then it will be necessary to short-circuit the brush-holders. With these conditions, the polarity of a main pole should be the same as the polarity of the commutating pole next to it in a clockwise direction when facing the commutator end of the motor.

Question on Maximum Demand

WITH reference to an article appearing in *Coal Age*, July 26, page 144, on the subject of maximum demand, which I read with much interest, I found, on looking up some of the catalogs of manufacturers selling demand meters, that there seems to be some confusion on the subject. Referring to the type R.A. demand meter description in the Westinghouse catalog I find the statement: "If the reset wheel is set for one-hour intervals, three offset marks give indications from which the 15- or 30-minute demands during the one-hour interval may be obtained." If this is true, then it would appear that the shorter the time interval the lower would be the maximum demand.

This statement does not agree with the article referred to above and it seems to me that there should be some further explanation. PENNA. READER.

Let us assume three maximum demand meters operating on the same circuit and measuring the 15-minute, 30-minute and one-hour maximum demand of a constant load. According to our definition the maximum demand is the average demand established over a given time interval. From this we see that the maximum demand on each meter must be the same. This is shown in the figure. The 15-minute demand meter would indicate 75 kw. maximum demand four times in the hour, the 30-minute demand meter would indicate 75 kw. twice in the hour and the one-hour demand meter would indicate 75 kw. once in one hour.

Note that the one-hour demand meter would be only half through registering in one-half hour and would therefore indicate 37.5 kw. Taking this halfway point and multiplying it by 2 gives the correct maximum demand and multiplying the quarter-hour registration on the one-hour demand meter by 4 gives the correct maximum demand. This is true only when the load is constant, which is a rare case.

From the chart referred to it is not correct to assume that the 30-minute offset gives the true maximum

EXPLANATION OF MAXIMUM DEMAND

It is apparent that the average demand for either the 15-minute, 30-minute or one-hour period must be the same and are all equal to 75 kw.

demand. Only when the load is constant is it possible to multiply this point by 2 to obtain the correct one-hour maximum demand.

Safety in Gas Welding and Cutting

ADDITIONAL suggestions for safety in gas welding and cutting were brought out as follows in a paper on the subject prepared by C. F. Worfolk, for the National Safety Council meeting recently held at Detroit. The first section of the paper appeared in the July 19 issue of *Coal Age*.

A properly trained welder will protect the other fellow from the "hot" metal. The green hand does not know enough to do so. He costs the employer a lot of money. Just because the first-aid department handles the burn case it probably is charged against the general cost of doing business and not against the person responsible. Employers know that they will need welders from time to time. There are many places where welders can learn the trade properly. It would seem good policy for the employers to encourage their men to take up trades of this nature when such excellent facilities are available as there are in most big cities. Schools like the technical public schools, the Y. M. C. A. schools and the institution that I represent, the Michigan State Automobile School, offer thorough courses under expert instructors.

Next to burns come injuries to the eyes. Most of them are absolutely preventable. Employers should compel their torch men and attendants to wear suitable goggles. It sounds easy and it is easy if the employer insists upon it. The torch flame looks harmless, but from it, as you know, constantly emanate rays which are destructive to the delicate mechanism of the human eye. A suitable goggle intercepts these rays. It also intercepts particles of rust and scale exploded from the surface of rapidly heated metal.

I remember asking a garage proprietor not long ago why he was willing to risk his eyesight by using a torch and not wearing goggles. He politely invited me to get out and mind my own business. Not many employers or boss welders are as inconsiderate and careless as he was and yet you will find plenty of welders at work with absolutely no protection for their eyes.

All sorts of helmets, goggles, body-protecting devices, asbestos shoes and so forth are today available to the welder. Make him use them. Make it easy for the welder to carry on his trade in comparative safety. When he gets hurt it costs money.

Important points summarized in conclusion are:

Insist on frequent and adequate inspection of all apparatus.

Insist that all hot articles be suitably marked.

Force the workmen to wear proper goggles and protecting devices.

Properly ventilate the welding shop to carry away any escaping gases, thus minimizing the danger of a shop explosion.

If tanks are used keep them out of direct sunlight and in a cool place, away from high temperatures.

Insist that none of your money goes to pay wages to a welder unless he is properly trained. If you refuse to employ the untrained green man he will manage to get proper training to fit himself for the job.

Properly instruct every employee who in any way comes in contact with the welding shop in regard to the hazards found in that shop.

Problems of Operating Men

Edited by
James T. Beard

Approving Use of Miner's Electric Cap Lamp by Firebosses

Fireboss' Duties Not Limited to Testing for Gas—Examination for Other Dangers Requires Better Light Than Afforded by Safety Lamp

HAVING read with interest the letters of the various correspondents appearing in *Coal Age*, it is my privilege to say that I entirely disagree with the stand taken in the letters of O. G. Sharrer, in the issue of Nov. 30, p. 879, and William Dickinson in the issue of March 29, p. 530. The former states as follows: "Any official whose duties require him to test for gas in the mine should carry no other lamp than an approved testing lamp."

It is true the electric cap lamp has no value for making a test for gas; but it is of great value in examining the condition of the roof and timbering. Mine officials have more duties than simply making tests for gas. They must examine the state of the roadways and the roof at the working faces, as well as make tests for gas.

It appears to me that it would be an easy matter to make a cap to cover the headlight when making tests. Any fireboss could make such a cap for himself out of a piece of old leather or rubber and cover the headlight on the electric lamp without losing any time.

ELECTRIC CAP LAMP AN AID NOT A HINDRANCE

Surely no correspondent has given this matter any careful consideration, who can make the statement that the carrying of an electric cap lamp would delay a fireboss in his examination, or in any way prove a menace to safety. How much of a fireboss' time is actually spent in making tests for gas? Is it not a fact that a good deal more of his time is taken up in examining the roof and timbering?

Again, no one who has ever performed that work would suggest that a fireboss can travel as fast by the light of an ordinary flame safety lamp, as he can by the light of an electric cap lamp. In my opinion, any time that would be lost by a fireboss in shielding the glare of his electric cap lamp when making a test would be more than offset by enabling him to examine the roof and coal more quickly and by giving him better light for traveling from place to place on his round.

Speaking of the limited time of the fireboss, Mr. Dickinson says, "Many firebosses will take chances under such conditions and not make any effort to screen their electric lamps, which thus become a menace to safety." Let me remark that any fireboss who will take chances is not fit to be employed in that capacity. By not screening his electric lamp, the fireboss becomes the "menace to safety" and not the electric lamp.

When a fireboss has to make his examination at the

speed described by Mr. Dickinson, no doubt many times he will lose his light. My belief is, therefore that it is a great benefit to a fireboss to have an electric light so that he will not be in the dark when he loses his flame light from any cause. Then, instead of stumbling about and bumping his head and body, he can walk out with a good light and reach a point where he can relight his flame lamp with safety.

Again, in the extraction of pillars where a fireboss must examine high falls and travel in the broken, an electric lamp should be a boon to him. Any one who has performed these duties by the light of a safety lamp, knows the difficulty and the danger of the situation.

I recall many experiences of twenty-five years ago, when firebossing in a mine where nothing but naked lights were used. It was imperative that the fireboss reach the top of all caves or get as near the top as was possible. Many a time did I bump my head and cut my hands and knees in getting out of a tight corner, after losing my light. Flame safety lamps, in those days, were not equipped with self-contained relighters and an electric cap lamp would have been considered a blessing by every fireboss.

MAKE ELECTRIC CAP LAMP COMPULSORY

Allow me to suggest that, instead of mine officials who make tests for gas being debarred from carrying electric cap lamps, they should be compelled to carry them. Also, I would say that the flame safety lamp should be so regulated with a reduced flame that it can only be used for testing purposes and not as a working lamp. This would make the lamp much safer for testing purposes.

In his letter Mr. Sharrer says:

"How often do we observe, assistant foremen and firebosses; yes and foremen and superintendents also, for that matter, traveling about the mine and carrying a lamp, having one side of the glass covered with soot. We must naturally conclude that if the glass is dirty, the gauze is also dirty, and the lamp for that reason unsafe. Yet there are hundreds of lamps used every day in that condition."

In that respect, let me say, if those officials each carried an electric cap lamp for a working lamp, and their safety lamps were so regulated that only a reduced flame could be obtained, their lamps could not get in the condition he describes. The same writer also thinks it would be an indication of old age and incapacity for the work, not to be able, by the light of his safety lamp, to see a crack existing in the roof. I doubt if our friend has ever looked at a crack in the roof by the light of a safety lamp, and then observed the same crack by the light of an electric cap lamp, or he would not offer such an argument.

Let the person be young or old, he will see the crack much better by the light of the electric lamp than by the glimmer of a safety. The same is true in regard to reading the vernier on a transit.

L'INCONNU.

Victoria, B. C.

Give the Fireboss the Best Possible Light

Electric cap lamp a Godsend to the fireboss—Need of a device other than the safety lamp for detecting gas—Advantage of a relighter in the safety lamp.

FOR the last thirteen years. I have worked as a safety inspector and assistant foreman. Naturally, the safety lamp was the most important part of my equipment in that work. In connection with my duties, let me say, I have spent many profitable moments recently, in reading the letters in *Coal Age*, under the heading "Problems of Operating Men."

Any one whose duties have been the examination of a mine, cannot fail to appreciate the stand taken by James Roberts of Frontier, Wyo., whose letter appeared in the issue for May 31, p. 902. Like Mr. Roberts, I have found the electric cap lamp a great advantage in my work. I regard this lamp as a Godsend to the fireboss whose greatest need will often be a good light.

More than once have I traveled to the face of a breast and there been caught in the dark and obliged to return to the gangway without a light, before being able to relight my safety lamp. Today, there is no need for a fireboss to stumble about in the dark when he has lost his light. The electric cap lamp enables him to retrace his steps in safety.

NEED OF SIMPLE DEVICE FOR DETECTING GAS

Just here, I wish to endorse the suggestion of James Hynd who, writing on the Wakesiah explosion, *Coal Age*, June 7, p. 940, asks, "Why does not the present inventive age produce a universal means of detecting gas that will eliminate the present hazard?"

As Mr. Hynd says, "We are still using the modified devices of one hundred years ago for this purpose." He refers, no doubt, to our use of the flame safety lamp, as there has not as yet been produced a testing lamp, or other device devoid of flame that will indicate the presence of explosive gas.

While recognizing the need of some device other than the safety lamp for detecting the presence of gas in the mine, I want to say that I have found the Koehler safety lamp a most efficient means for making the test for gas. My lamp is of aluminum, has a double gauze and is equipped with a flint relighter. The lamp admits the air below the glass, which greatly improves the light.

ADVANTAGE OF RELIGHTER IN SAFETY LAMP

No fireboss will deny the advantage of having a relighter in his lamp. He is bound to get in the dark some time and this device avoids the necessity of his going back to the gangway to relight his lamp. All he needs to do is to retreat a short distance and give the flint a few turns to restore the light in his lamp.

An instance illustrating this point occurred a short time since when, with two other firebosses, I entered a gangway where gas had been fired and the men had gone out leaving a mule behind. It being the duty of the firebosses to extinguish the fire, we were doing so when the gas fired again putting out all our lights.

The two firebosses had Davy lamps and but for the relighter in my Koehler lamp we would have had to travel a long distance in the dark. As it was, however, I withdrew a short distance and with a turn of the flint relighted my lamp, after which we extinguished the fire and rescued the mule.

In my opinion, when a fireboss is equipped with an approved safety lamp, such as the Koehler, and an electric cap lamp he is able to accomplish his rounds in less time and with less fatigue, than where he must work with his safety alone. Moreover, his examination of the mine will be more efficient, because of the bright light, which will reveal a dangerous condition of the roof that might pass unobserved in the use of a safety lamp.

While a good mechanic can work with inferior tools, he can do far better work with good tools at his command. The same is true in firebossing. A competent fireboss may even lose his life for want of a good light. Therefore, let me say in closing: Give the fireboss all the light possible. WILLIAM E. TRUSCOTT.

Minersville, Pa.

Obeying the Spirit of the Law and Not the Letter Only

Danger in creating too many and too stringent laws—Enforce faithfully existing laws—Instances cited where the company fulfilled the letter but not the spirit of the law.

IN TWO recent letters, C. W. Atkins has referred to the inadequacy of mining laws, in a way that should arouse attention and call for remedial action. What Mr. Atkins has said applies particularly to his own state, Pennsylvania. My remarks must not be taken as applying especially to that state more than to other coal-producing states. The situation is quite a general one. What I want to say fits many of our mining states, if not all of them.

There is little doubt but that our mining laws can and some day will be improved. In the meantime, however, by systematic, unceasing and earnest application of the laws we have, we can get a great deal closer to the goal we aim to reach than we are at present. The goal of our endeavors is to reduce mine accidents to a minimum.

ENFORCE PRESENT LAWS TO MAKE MINES SAFER

Certainly, it is not right to ask our legislators to make new laws for us so long as we fail to give a thorough trial to those now on the statute books. If at any time it may seem advisable to reinforce existing laws or replace them by others, we must be cautious lest we create a situation where too many laws or laws of too stringent a character would hamper our coal industry without making it any safer.

By willingly conforming to the spirit as well as the word of our laws as they stand to-day, operators have it in their power to make their mines so much safer that the cry for more laws will cease to be heard. Some operators deceive themselves into believing they have done all that is expected of them when they have placed a few warning signs about their mines and posted a set of rules and regulations on the bulletin board at the mine entrance. To a large number these signs mean little so long as the operator does not make it his regular and daily business to see that they are obeyed by every man in the mine.

Suppose, for example, that an old heading, partly caved and in places not more than two feet wide, is used to take several high-tension cables into the mine. At either end notice is posted forbidding men to go in or out that way. But of what use are those notices when it is known to the foreman and his assistants that a

number of men are using the heading twice daily, because it shortens the distance home and nothing is said to stop them?

A case of this kind was recently brought to the attention of a certain mine manager who, after investigating, refused to interfere on the ground that men were scarce and if they were not allowed to use the short cut in going to and from work, they would probably find work in another nearby mine which is close to their homes.

Considering the circumstances, how much better would it have been to repair the old heading and make it safe to be used as a traveling road and a cable way at the same time. Instead, however, the manager decided that posting the notice at either end of the place, the company's responsibility under the law ceased, which was true considering the word and not the spirit of the law.

In another instance two men were killed, in a single month by being thrown off the loaded cars they were riding out of the mine. Here, again, notices had been posted warning all men against riding the cars. In the opinion of the superintendent and his foreman,

this absolved them of all blame, although both freely admitted that they knew the men generally rode on the cars both going in and coming out of the mine. Yet no effort was made to stop the practice.

In this case as before, the company complied with the letter of the law, but not a single thought was given to its spirit. I could cite from memory a score of similar examples where the operators were deceiving themselves as to the extent of their duties to their fellow men either through fear of losing their miners or from a reluctance to spend money for the sake of safety alone.

There are operators, both large and small, who obey the spirit as well as the letter of the law and sometimes go much further in an effort to make their mines as safe as is reasonably possible. Too often, however, the argument is advanced that, unless the law is obeyed to the same degree by all, those obeying it fully and ungrudgingly will find themselves at a disadvantage, in respect to operating costs, as compared with those who adopt only such safety measures and practices as they cannot possibly avoid.

F. C. CORNET.

New York City.

Inquiries Of General Interest

Working Three Feet of Coal with Slate and Shale Partings

Combined Thickness of Three Seams and
Partings Ranges from 12 to 15 Ft.—
Thickness of Coal Approximates 7 or 7½ Ft.

A FEW days ago, the president of a recently organized coal company, asked my opinion as to what would be the best method to develop a tract of coal land consisting of one hundred acres and underlaid by three seams of bituminous coal of a fairly good quality, two of the seams being of the nature of splint coal. At my request, he gave the following as the approximate cross-section of the three seams and the intervening partings of slate and shale. Reading from top to bottom, the section is:

Roof,	Hard sandstone
Top seam,	Hard splint coal, 42 in.
Parting,	Hard sandy shale, 48-72 in.
Middle seam,	Hard splint coal, 30-36 in.
Parting,	Medium hard slate, 18-24 in.
Bottom seam,	Rather soft clean coal, 12 in.
Footwall,	Hard sandy shale.

It was stated that the intention of the company was to work these seams by some method that would give a high percentage of production, per man, per day, and mine the coal in as large size as possible, consistent with the requirements in the several seams. It was expected to shoot all the coal off the solid, the desire being to avoid the necessity of installing mining machines, for a considerable time to come.

After carefully considering the proposition and assuming a practically level formation, I suggested open-

ing up the property on the plan of a double-entry system, provided there was no gas generated in quantities that would make advisable driving the main entries three or four abreast, this being a small tract.

My general plan was to drive double or triple rooms, say from 60 to 90 ft. in width. The main and cross entries, together with these rooms, were to be opened in the middle seam where the coal has a thickness of 2½ to 3 ft. The two or three tracks in each double or triple room would reduce the distance the coal had to be handled at the face to not more than 15 ft. The roads were to be brushed for a width of 10 ft., by lifting the parting and bottom seam of coal down to the footwall, which would provide good floor and roof on the roads.

These double or triple rooms were to be separated by pillars of solid coal, 50 ft. in thickness, that would permit each pillar to be split with another room 20 ft. wide when retreating and bringing back the 15-ft. pillars on either side. This plan appealed to me as affording a long range of working face that would greatly facilitate the mining of the coal, particularly in respect to blasting. The holes could then be drilled to better advantage than in a narrow place. A favorable feature of the plan is the promise of a larger percentage of lump coal and a minimum cost of explosives in blasting.

When the rooms in the middle seam, which is only 2½ to 3 ft. in thickness, have advanced sufficiently to cause a little weighting and settlement of the roof, my plan would be to break through the parting forming the roof and having a thickness of from 4 to 6 ft., dropping this material and storing it between the roads and, at the same time, taking down the top coal. A line of posts would have to be set on each side of the tracks. The main roof being a very hard massive sandstone suggests that it will require very little timbering.

Another suggestion made at the same time was that it might be found that the proposition could be worked out successfully on a system of longwall advancing, in panels 300 ft. in width. The large amount of material in the partings would furnish good building for the packwalls. I would like to see this proposition dis-

cussed by the readers of *Coal Age*, giving us the benefit of their experience under similar conditions.

Glen White, W. Va.

PRESTO.

We are pleased to submit the above proposition and proposed plan of working to the practical readers of *Coal Age* for their criticism and suggestions and hope for a hearty response.

Examination Questions Answered

Miscellaneous Questions

(Answered By Request)

QUESTION—*The length of a main-and-tail-rope haulage is 7,000 ft. (no grade); the weight of the main rope is 0.8 lb. per ft., and the weight of the tail rope 0.6 lb. per foot; the full cars weighed 6,000 lb. and the empty cars 1,800 lb., each; the train consists of 15 cars. What are the tensions on the main and tail ropes? If the average speed is 10 miles per hour, what is the horsepower due to the maximum tension of the rope?*

Review of reply made July 12, where a decimal point was unfortunately misplaced.

ANSWER—In the general arrangement of a main-and-tail-rope haulage, the main rope hauls the loaded trip from the inby parting to the shaft or slope bottom, or the tippie, as the case may be, at the same time dragging the tail rope which is attached to the rear end of the trip. The weight of this loaded trip is $15(6,000 \div 2,000) = 45$ tons; and that of the empty trip $15(1,800 \div 2,000) = 13.5$ tons. The average weight of the two ropes being 0.7 lb. per ft., the entire weight of rope, extending in and out of the mine (14,000 ft.), is $0.7(14,000 \div 2,000) = 4.9$, say 5 tons. Then, when hauling the loaded trip out of the mine, the entire moving load is $45 + 5 = 50$ tons. Assuming an average track resistance of, say 20 lb. per ton, including the drag of the rope, the average tension on the main rope is $20 \times 50 = 1,000$ lb.

On the other hand, when hauling the empty trip into the mine, the average weight of the entire moving load is $13.5 + 5 = 18.5$ tons and, for the same track resistance, the average tension on the tail rope is $20 \times 18.5 = 370$ lb.

At a speed of 10 miles per hour ($5,280 \times 10 \div 60 = 880$ ft. per min.), the horsepower due to the maximum tension on the main rope is $(1,000 \times 880) \div 33,000 = 26\frac{2}{3}$, say 27 hp., which is the power due to the maximum tension on the rope and takes no account of the efficiency of the engine. The resistance of rope and track depends on many factors not given and is liable to be more than 20 lb. per ton, the power required being increased proportionately.

QUESTION—*The fan produces 76,300 cu.ft. of air per minute, in an airway 7x10 ft. in section; (a) what is the velocity of the air current, in feet per minute? (b) What is the horsepower if the water gage is 1 in.?*

ANSWER—(a) The sectional area of the airway is $7 \times 10 = 70$ sq.ft. and the average velocity of the air current at that point is, therefore, $76,300 \div 70 = 1,090$ ft. per min.

(b) A water gage of 1 in. corresponds to a pressure

of 5.2 lb. per sq.ft., which makes the total pressure producing circulation in this airway, $70 \times 5.2 = 364$ lb. This total pressure moving at a velocity of 1,090 ft. per min., gives $1,090 \times 364 = 396,760$ ft.-lb. per min. The horsepower on the air is, therefore, $396,760 \div 33,000 = 12.02$, say 12 hp.

QUESTION—*What instructions should a mine foreman give to a miner in regard to the following: (a) The precautions he should take on first entering his working place? (b) What he should do to insure his safety while at work? (c) What he should do if his working place becomes dangerous? (d) In case of a miner firing his own shots, what precautions should he take for his own and other persons' safety? (e) What precautions should he take while traveling into and out of the mine?*

ANSWER—(a) The foreman should instruct the miner to examine carefully his place before beginning to work and reset any props that may have been dislodged by shots fired the night before. He must also be told to take down any loose slate or roof and examine carefully for loose coal that may be ready to fall. He must be told to look for the mark of the fireboss showing that the place has been examined that morning and found to be safe. In addition, he must at once set any timbers required to make his roof safe before proceeding to load coal or do other work.

(b) While at work, the miner must be instructed to keep a careful watch for any change that may take place in the roof and to sprag his coal as it is mined. When working with safety lamps, the miners must be instructed to observe the flame of their lamps at frequent short intervals to detect any increase in the gas in their places.

(c) The miner must be instructed to withdraw from his place, at once, on observing any dangerous condition and report the same to the mine foreman or one of his assistants. He should be told to fence off his room or place a suitable danger signal at the entrance and at the open crosscut or breakthrough leading to an adjoining place, and to warn the men working in adjoining places, before he leaves his own place.

(d) Each miner must be instructed to make sure, before firing a shot, that he has complied with all rules and requirements in respect to blasting, including the proper mining of the shot, the charging and tamping of the hole and the manner of firing. He must also give the necessary warning to men working in adjoining places and receive their response, giving him the right to fire his shot. He must sound the alarm in such a manner that any person approaching the place will be duly warned of his danger. After firing the shot and allowing sufficient time for the air current to sweep away the smoke and gases produced, the miner must examine the condition of the roof and timbers before again starting to work.

(e) The foreman should instruct all miners to enter and leave the mine by the travelingways used for that purpose. Every miner must hang his check in its proper place on the board provided for that purpose at the entrance of the mine, before he leaves for home. On returning to work the following morning, the miner must take his check from the board, which is the guarantee that he can proceed to work in his place with safety. Not finding his check on the board, the miner knows that he is forbidden to enter his place until the same has been examined and made safe for work.

Coal Situation Fraught with New Seriousness Because of President Harding's Death

BY PAUL WOOTON
Washington Correspondent of *Coal Age*

The President cannot die without affecting all industries and most individuals. The death of Mr. Harding comes at the worst possible time in so far as it affects the coal situation. It is certain to have a direct bearing on labor relations, which are now in such an acute stage.

While those who are in a position best to appraise the situation are convinced that there will be no strike, they must admit that the situation is one in which a crisis might develop at any time. Government intervention is more likely now than ever before in peace time, due to the fact that the public is not inclined, after the experiences of the last few years, to endure suspense as to its fuel supply.

Enough has been learned in the last few years of government intervention to make it clear that it is a diplomatic rather than an executive undertaking. To undertake to mediate in such a situation as exists today in the anthracite region means the employment of diplomacy such as is implied by the better sense of the word—the use of sympathy and understanding. Such a task can be undertaken only by a person in whom both sides have confidence.

Whatever may be said about Mr. Harding's greatness as an executive, no single individual in the land will dispute that he was a man of friendship—a man with an intense desire to do the right thing. He commanded the respect of capital and labor alike because they knew he was big-hearted and would do his best to be fair. Furthermore, the public would have been satisfied with his mediation. People generally do not have an opportunity to go into the details of issues. They would have been willing to abide by his conclusions. The man so amply fitted to undertake mediation has been removed suddenly.

It is true that the country is to be spared the aimless drifting which marked the administration's policy just before and during the strike of 1919. At that time there was great uncertainty as to the extent of President Wilson's incapacity. No one was sure whether or not the pronouncements coming from the White House were those of the President or of someone else. Later it was established that some of these pronouncements, at least, did not come from the President himself.

In the present situation the uncertainty is of a different character. There naturally will be delay before the new helmsman will feel confident to take the ship of state into the main channel. The situation is complicated by lack of knowledge as to what the new President may do. The outstanding achievement of his career is his handling of a labor matter. His action at Boston in connection with the strike of policemen brought him into national prominence and obtained for him the praise and support of those who believe a firm stand must be made against the exactions of labor unions. That act, however, antagonized labor.

It is certain the United Mine Workers would hesitate a long time before they would agree to accept President Coolidge as final arbiter of questions which to them seem vital. Unquestionably labor unions are not at all sure but that one of the principal opponents of their policies has been elevated to the Presidency. They must recognize that since Mr. Coolidge first came to national notice because of his stand against unionism it would be only natural if he were to be of the opinion that the public approves of such a policy. His experience in Boston may have convinced him that unionism must be curbed and that nothing can be gained by temporizing with it. In such a case he might conclude that the anthracite situation offers a splendid opportunity to put his views into effect.

On the other hand, many think Mr. Coolidge will take this opportunity to demonstrate that he is not opposed to labor unions when properly conducted. He may admit the right of the United Mine Workers to demand all that they have and to strike if they do not get what they ask. At best, however, it is admitted on all sides that the prospect

of agreement is less auspicious today than it was yesterday.

Many doubt that the check-off is the real objective of the United Mine Workers. The rank and file of that organization is so much more interested in wage than in any of the collateral issues, that it is not probable that the necessary support will be forthcoming to insist upon the check-off. The check-off means a great deal to those who are responsible for the financing of the International union but it means much less to the member of a local. The heads of labor unions are like political leaders or the heads of European states in that they can go only so far in persuading their people to accept solutions which are distasteful to them.

Signs are multiplying that the anthracite workers are ready to insist on the increase. Apparently the more conservative leaders, like the heads of the International union, will have great difficulty in avoiding a suspension unless they can promise a wage increase. During the last strike it was asserted at first that the anthracite workers were being held out to win for the bituminous workers, and that if they were left to themselves they would return to work. Exactly the reverse proved to be the case. It was nearly a month after the Cleveland agreement before work was resumed, and even then the terms of settlement were all but rejected when the ratification convention met in Wilkes-Barre. Steam-roller tactics had to be employed to get ratification through, and even then it carried by a small margin.

New factors have entered since then to bolster up the determination of anthracite workers. They elected Capellini. They not only elected him but they did it by a large majority. For a time after his election Capellini seemed to have joined hands with the conservative leaders, but now that he has been accepted as a member of the negotiating committee he has come out with a statement that he will not surrender any demand and that he will press each one of them. With the death of the President and with unmistakable signs of increased determination on the part of the mine workers the prevalent opinion in Washington is that the situation has taken on new seriousness.

Coal Commission Resolution Expresses Deep Loss in Passing of President

The only business transacted by the U. S. Coal Commission at its meeting last Friday was the adoption of the following significant resolution:

"The United States Coal Commission places upon its records the unanimous regrets of its members at the sudden death of Warren G. Harding, President of the United States. This is not the usual and perfunctory expression of regret at the passing away of the nation's Chief Executive. It has a personal and intimate side connected with it, which should be known by the American people.

"Every member wholeheartedly pays tribute to the patriotic and honest purpose which President Harding had in the appointment of this Commission. It is constituted of men of all grades of political thought and was manifestly so constituted by the President in the hope that out of these political and economic views the facts might be found and conservative recommendations given with reference to the coal industry. It is due, also, to his memory to say that having once made up his mind as to the membership of the Commission, from that time forward neither by word, sign nor gesture did he ever intimate to the Commission any personal or political desire with reference to the investigation, finding of facts, or recommendations of the Commission. He left it free and untrammelled, and his memory must not be smirched by any false suggestion that he had

in view any political ends to serve either by the appointment or by the report of this Commission.

"From the personal standpoint it regrets the departure of a warm-hearted personal friend. It pays him the tribute of saying that he was a worthy President of the United States; that from the standpoint of his views, he honestly and fearlessly sought to administer the laws of this country and to direct its destinies along lines which he believed would be for the best interest of the American people.

"He has been a great example that might well be imitated in the political and economic life of America. He held his views, but without bitterness or malice, and granted the right of others to differ with him. He argued; he never vilified. He had malice toward none and charity for all. After life's fitful fever, the Commission confidently believes that his soul is at rest with his God."

The early part of the week was a very active one for the Commission, as a result of the appearance of a Special Committee of Bituminous Operators. Apparently, the Commission is much pleased at having received so much constructive material. The Commission obviously is glad to have the bituminous operators meet in advance the recommendation contained in the Commission's anthracite report. It is understood in association circles that the action favorable to publicity was unanimous. It is said to bind practically every worth-while coal man in the business. Some observers believe that this voluntary action is intended to obviate the necessity for legislation.

Coal-Mine Fatalities in June Gain Slightly In Number and Ratio to Output

Accidents at coal mines during June, 1923, caused the death of 172 men, according to reports received from state mine inspectors by the U. S. Bureau of Mines. The fatality rate for the month, based upon a production of 54,155,000 tons, therefore was 3.18 per million tons. For the corresponding month last year the rate was 4.91, based on 110 fatalities and an output of 22,393,000 tons. The small amount of coal mined in June, 1922, was due to the coal strike at that time. An average of 4.28 deaths per mil-

lion tons is shown by the record for June during the past ten years. In May, 1923, the fatality rate was 3.11 per million tons produced.

The fatalities in June, 1923, have brought the total deaths for the first half of the current year to 1,221, indicating a fatality rate of 3.76 per million tons, as against 868 fatalities in the same period last year, representing a rate of 4.14. Thus the fatality rate for the present year represents a reduction of more than 9 per cent.

The year's record to date for all fatalities from all causes shows a reduction in the fatality rates per million tons for haulage accidents and for falls of roof and coal, a slight increase for explosions of gas and dust, and no material change in the rate for explosives and electricity.

Wentz Acquires New River Collieries

Purchase of the mines of the New River Collieries Co., located at Sun and Eccles, W. Va., by the Stonega Coal & Coke Co., of Big Stone Gap, Va., gives the latter company an additional output of approximately 1,000,000 tons of high-grade low-volatile smokeless coals. The mines taken over by the new owners are Sun Nos. 1 and 2, located at Sun, and Eccles mines Nos. 3, 5 and 6, located at Eccles, W. Va. The Sun and Eccles No. 6 mines operate the Sewell seam, while the other openings operate the Beckley seam. During 1921 these mines produced about 831,169 tons of coal.

The Stonega company mines have a possible production of about 5,000,000 tons of steam and gas coals and in 1921 produced between 2,500,000 and 3,000,000 tons. Its properties consist of the Arno mine, at Arno, Va.; Dunbar mine, at Roaring Fork; Exeter mine, at Exeter; Imboden mine, at Imboden; Keokee mine, at Keokee; Osaka mine, at Osaka; Roda mine, at Roda, and the Stonega mine, at Stonega.

Colonel D. B. Wentz, of Philadelphia, is president of the Stonega company; Otia Mauser, vice-president, and R. E. Taggart, general manager, both located at Big Stone Gap. J. K. McGowan is president of the New River Collieries Co.

The newly acquired mines are served by the Chesapeake & Ohio and Virginian Rys. with terminals at Hampton Roads.

Bituminous Coal Stocks Gain 3,000,000 Tons in June— Industrials Have 46 Days' Supply on July 1

On July 1, 1923, commercial consumers had in storage approximately 45,000,000 net tons of soft coal, according to a report just issued jointly by the Bureau of the Census, Geological Survey, and the Federal Fuel Distributor. This was an increase over the revised figures of stocks on June 1, 1923, of 3,000,000 tons. Except in the month of February stocks have steadily risen since September 1, 1922, and there is now in storage twice the quantity that was on hand on that date. The supply on July 1, 1923, was larger than on any date since the spring of 1922, when exceptionally heavy supplies had been accumulated in anticipation of the strike on April 1, 1922. Stocks on July 1 exceeded those on August 1, 1921, by 4,000,000 tons, and were nearly 5,000,000 tons larger than on April 1, 1919. Measured in terms of tons, stocks increased 7 per cent during June. Measured in terms of days' supply, the increase was 23 per cent. The larger increase in days' supply was due to the fact that the rate of consumption decreased perceptibly in June. At the rate of consumption in June the stocks on July 1 were sufficient to last 37 days on the average.

Stocks on the Lake docks at Duluth-Superior and Ashland-Washburn on July 1, 1923, were about 2,850,000 net tons. Records for the Lake Michigan docks are not available. A group of producers who store coal at mines or intermediate points had 688,000 tons in storage on July 1.

Retail dealers in anthracite received more of that coal than they delivered in June, and their total stocks on July 1 were 13 per cent larger than on June 1. Incomplete reports on the quantity of anthracite on the Duluth-Superior

total stocks on hand for all dates for which statistics are available, since October 1, 1916.

The total quantity of soft coal in the hands of commercial consumers on July 1, 1923, was between 43,000,000 and 47,000,000 net tons—probably 45,000,000 tons. This esti-

FIG. 2—DAYS' SUPPLY HELD BY DIFFERENT CLASSES OF CONSUMERS ON JULY 1, 1923, AND AUGUST 1, 1921

At the rate soft coal was burned during June, 1923, the total stocks on July 1 were sufficient to last 37 days, an increase of 7 days over the supply on June 1. The stocks on August 1, 1921, were sufficient to last 39 days at the low rate of consumption then prevailing. An important factor in the increase in days' supply on July 1 was an appreciable decline in the rate of consumption in June.

FIG. 1—TOTAL COMMERCIAL STOCKS OF BITUMINOUS COAL, OCT. 1, 1916 TO JULY 1, 1923

Figures represent million net tons and include coal in the hands of railroads, industrial consumers, public utilities, and retail dealers. Coal for steamship fuel, lake docks, in transit, and in the bins of householders is not included. The figures for 1923 are subject to revision.

and Ashland-Washburn docks indicate that the total on hand July 1 was in the neighborhood of 250,000 net tons. No data are available for the Lake Michigan docks.

The accompanying diagram (Fig. 1) shows the estimated

mate does not take into consideration coal in the cellars of householders, concerning which no statistics are available, nor steamship fuel, nor coal on the Lake docks, which item is classed as coal in transit. The progress in accumulation of reserves has been such that the supply on July 1, 1923, compares favorably with that during preceding summers.

Consumption, on the contrary, decreased in June. The reports furnished by consumers, supplemented by other available records, indicate that the total consumption, including exports, was approximately 41,000,000 net tons, or 9,500,000 tons per 7-day week.

Figure II, which is based upon the data in the table below, offers a comparison of the days' supply held by the seven principle classes of consumers on July 1, 1923, with that on August 1, 1921, the date which most nearly corresponds with that now under observation, for which records are available. In using that date for comparative purposes it should be carefully noted that in actual tonnage stocks were less then than now, but owing to the low rate of consumption in the summer of 1921, due to the severe industrial depression, the days' supply was larger. The average stocks on July 1 were sufficient to last 37 days at the rate of consumption in June, whereas those on August 1, 1921, were sufficient to last 39 days at the rate of consumption from August 1 to November 1 of that year. At the rate of consumption from March 1 to May 31, 1923, the supply on June 1 would have lasted 30 days.

General industrial establishments, excluding steel and by-

DAYS' SUPPLY OF BITUMINOUS COAL IN HANDS OF CONSUMERS (i)

(Figures represent number of days' supply would last at current rate of consumption at time of stock-taking)

Consumer	Jan. 1, 1919	Apr. 1, 1919	June 1, 1920	Apr. 1, 1921	Aug. 1, 1921	Sept. 1, 1922	Nov. 1, 1922	Jan. 1, 1923	Feb. 1, 1923	Mar. 1, 1923	June 1, 1923	July 1, 1923

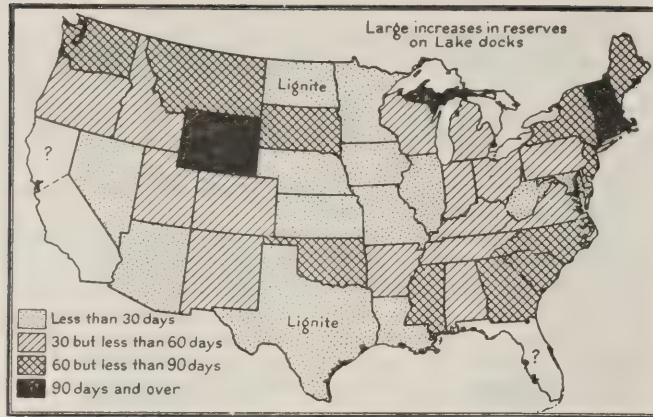

FIG. 3—DAYS' SUPPLY OF SOFT COAL ON HAND AT INDUSTRIAL PLANTS ON JULY 1, 1923

At the average rate of consumption that prevailed during June, 1923, reserve stocks at industrial plants other than steel and by-product coke would last on the average 46 days. The map shows how the supply varied from State to State. Changes in business activity which affect coal consumption are quickly reflected in the days' supply. Based on reports from 2,107 plants.

product coke plants, form the largest group of consumers and the one that shows best the geographical distribution of stocks. Changes in activity in this group are quickly reflected in the coal market, and changes in the coal market soon become apparent in the reserve stocks of industrials.

Over the country as a whole the stocks held by general industrials were sufficient to last 46 days on the average. This was an increase of 7 days over the supply on June 1, but was 10 days less than that on August 1, 1921. In comparison with dates on which stocks held by industrials were large, July 1, 1923, was 19 days behind January 1, 1919, 18 days behind January 1, 1922, 21 days behind November 1, 1921, and 5 days behind January 1, 1922. On the other hand, stocks on July 1 were 14 days ahead of September 1, 1922, and 22 days ahead of June 1, 1920, on which dates the supply was at the lowest points on record.

Practically all the States on the Atlantic seaboard, except those in which coal is produced, the Northern Peninsula of Michigan, and scattered states in the South and Northwest, had supplies sufficient for more than 60 days. Maryland, West Virginia, and Illinois as usual had small reserves, owing to the presence of mines within their boundaries. All other States east of the Mississippi had stocks sufficient for 30 but less than 60 days' consumption. Of the States west of the Mississippi, 10 had less than a 30-days' supply, 6 had less than a 60-days' supply, and 5 had more than a 60-days' supply.

Electric-utility plants had stocks on hand on July 1 sufficient for 48 days, against 45 days' supply on June 1.

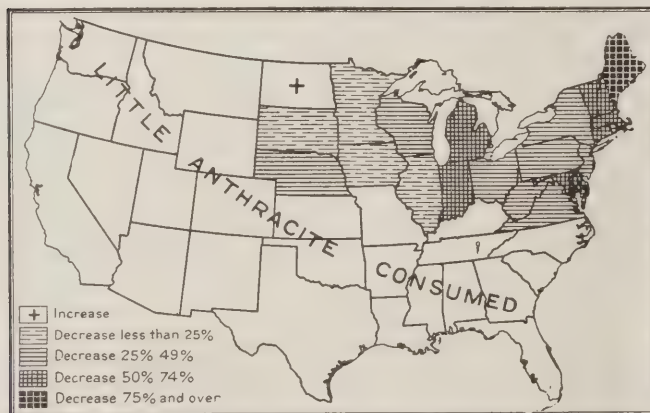

FIG. 4—HOW RETAILERS' STOCKS OF ANTHRACITE ON JULY 1, 1923, COMPARED WITH THOSE ON AUGUST 1, 1921

Stocks of anthracite in retail yards were 13 per cent larger on July 1 than on June 1, 1923. The supply was sufficient to last on the average 25 days at the rate of delivery in June. The map shows how stocks on July 1 1923, compared with those on August 1, 1921. In only one of the anthracite-consuming States was the supply greater than it was 2 years ago.

The stocks at coal-gas plants increased from a 75-days' supply on June 1 to 89 days' on July 1, 1923. Incomplete returns from byproduct coke and steel plants indicate that the reserve coal tonnage on hand at such plants on July 1, 1923, was about 5 per cent larger than on June 1. Operations at such plants were curtailed somewhat during June and the days' supply on July 1 was 27, against 25 on June 1, an increase of 8 per cent. The stocks held by these important groups of consumers are now twice those on hand September 1, 1922, but in spite of this progress in replacing stocks that were so nearly exhausted during the miners' strike last summer, reserves on July 1 were below those on other dates when stocks were large.

Estimates of railroad-fuel stocks place the total in stockpiles, cars, and chutes, on July 1, at 10,550,000 tons, a supply sufficient for 28 days, an increase over June 1 of 33 per cent.

Deliveries of soft coal by retail dealers decreased in June, the average rate being 22 per cent less than that during the three months preceding. On July 1, 1923, retailers had a supply sufficient to last 39 days, as against 27 days' supply on June 1.

All available information indicates that during June there was a comparatively small increase in the quantity of coal in transit which probably did not exceed 5,000,000 tons.

Information available indicates that the total soft coal on all Lake docks must have been at least 4,000,000 tons on July 1. On August 1, 1921, a month later, the total was 8,189,000 tons. The quantity of unbilled coal in cars standing at the mines increased from 421,000 tons on June 1, to 550,000 tons on July 1. The tonnage at junction points and terminals underwent practically no change in June, and totaled 35,000 tons on July 1.

Owing to the duplication of reports from one large producer who stores coal at the mines, the figures of mine storage recently published have been too high. The total held on July 1, by the producers that reported was 688,000 tons, against a revised figure of 779,000 tons on June 1, a decrease of 12 per cent.

Surplus stocks of by-product coke were accumulated in June, and the total on hand on July 1 was 308,000 tons, an increase of 52.5 per cent over the supply on June 1. Despite this increase, however, stocks of by-product coke were less than half those on March 1, 1922, when the reserve was heaviest.

The stocks of anthracite in retail coal yards on July 1, 1923, though 13 per cent larger than on June 1, were much lower than during the spring and summer of preceding years. It has not been possible for the Government to make a complete count, but a selected list of 418 dealers from whom reports have been received since 1919, shows total stocks of 787,426 tons on July 1, against 694,922 tons on June 1, 1923. These plants had 49 per cent less anthracite on hand on July 1 than on August 1, 1921, and 17 per cent less than on January 1, 1919. How much anthracite all dealers had is not known, but it is possible that the relation between stocks held by this group on different dates, might approximately represent all dealers.

Kanawha the Belgium of Coal Industry Operators Tell Coal Commission

Charging that the Kanawha coal fields of West Virginia have been made the battle ground of union activities, the Kanawha Coal Operators' Association in a brief filed with the United States Coal Commission on Aug. 6 declares that the public cannot be assured of an adequate supply of coal at a low price until some means is found for preventing nationwide strikes in the coal and transportation industries.

Stimulated unrest in the Kanawha district, charged to the machinations of the United Mine Workers, the brief states, is directly responsible for some of the acute suffering among consumers of coal during the national strike. It is contended that while the Kanawha fields were providing fuel for those sections of the country affected by the strike, the United Mine Workers centered their activities on that zone in an effort to decrease even that production.

"From the beginning the Kanawha district of West

Virginia has been the Belgium of the coal industry," the brief states. "It has repeatedly been a battle-ground in struggles which properly involved only the Central Competitive Field. Every time there was a strike in Ohio or any of the other unionized states, organizers were sent to West Virginia to create dissatisfaction and cause strikes, in order that coal mines in the Kanawha district should not supply the markets of the unionized districts and thereby render less acute the shortage of coal to the public which the union leaders hoped to create."

After pointing out certain of the evils, the Association makes several recommendations whereby it claims these evils can be eliminated. Some of these are that no further extension of the labor monopoly of the United Mine Workers of America should be permitted; the right of non-union men to work without discrimination and without fear of physical violence should and must be preserved; the United Mine Workers of America should be made legally responsible for the fulfillment of the contracts into which they enter; the Sherman Anti-Trust Law and the other laws governing monopolies and contracts and combinations in restraint of trade should be enforced against attempted monopolies of labor as well as against attempted monopolies of capital; some means must be found for preventing nation-wide strikes in the coal industry and in transportation as well; measures must be taken to restore the impaired credit of the railroads and thereby make it possible for them to obtain funds for needed improvements and extensions, and some method of insuring the prompt returns of coal-carrying equipment to the coal-originating roads must be devised.

Examiner Kephart Recommends Revision of Docks and Illinois Coal Rates

The Northwest coal rate case about which so much interest was centered in the past six months was reported on by C. I. Kephart, an examiner of the Interstate Commerce Commission on Aug. 3. He recommends modification of the Holmes and Hallowell scale from Lake Superior docks to points in Minnesota, North Dakota and South Dakota reducing the scale on rates up to 350 miles. The reductions range from 10c. (present rate 85c. to proposed rate of 75c. for distances of 35 miles or less) to a reduction of 1c. from \$3.10 to \$3.09 for distances of 300 to 325 miles. It is further recommended that rates on bituminous coal from Lake Superior docks to Marshalltown, Lacey, and Oscaloosa, Iowa, be considered unreasonable to the extent that they exceed \$3.10, \$3.35 and \$3.35 and to other related points in the same territory on the same basis. This represents reductions of 18c. and 17c. below rates.

The rates on bituminous coal and anthracite from Lake Superior docks to Sioux City, Iowa, are held to be unreasonable to the extent that they exceed \$3.35 and \$3.53 per ton, respectively. Present rates are \$3.59 on bituminous coal and \$3.89 on anthracite and the reductions recommended are 24c. and 36c. respectively. Rates on coal from all the Illinois mines to Sioux City are held to be unreasonable, unduly prejudicial to Sioux City and preferential of Minnesota, Nebraska, and other Iowa points to the extent that they exceed \$3.45 from Northern Illinois and Fulton-Peoria, \$3.83 from Springfield, \$4.08 from Belleville and \$4.20 from Southern Illinois. Reductions per ton range from 22c. to 35c.

The rates on soft coal from Lake Michigan docks and the various Illinois districts to South Dakota points west of the Aberdeen-Mitchell-Yankton line of the Milwaukee are held to be unreasonable to the extent that they exceed the Aberdeen-Redfield-Mitchell-Yankton rates by amounts ranging from 38c. at Chamberlin to \$2.00 at Rapid City; also to the extent that the rate at Winner exceeds \$5.20 from Michigan docks, Northern Illinois, and Fulton-Peoria, and that amount plus existing differentials from Southern Illinois groups.

The examiner finds that rates from Southern Illinois and Lake Michigan docks to Wisconsin points are unduly prejudicial to the dock shippers and preferential of shippers in Southern Illinois "to the extent that the difference between the rates from the two sources of supply to the same point

depart from the difference that results from the application of the scale set out before and in the matter stated from Herrin as a representative Southern Illinois shipping point." The scale referred to recommends rates from Herrin as a representative point ranging upwards from \$1.40 on lump coal for distances of 100 to 125 miles to \$4.04 for distances of 675 to 700 miles.

The existing relationship between Lake Michigan docks under the Wisconsin rate structure should not be disrupted on this record according to the examiner.

Uncertain Political Situation Reacts On German Coal Importation

BY H. O. HERZOG

BERLIN, July 13: Importation of coal into Germany is becoming more and more affected by impending political developments. Despite a marked improvement in business and the shortage of domestic production due to labor unrest, coal dealers maintain a strong reserve with regard to new import contracts. This is partly due to the difficulties of financing, increased by the restraint the government has put on the money market against exchanging German paper money into foreign money, restricting purchases to such as can be paid from export proceeds. The main factor, however, is that the Ruhr occupation has visibly entered into its last stage and the end is within sight although the issue is still entirely in the dark. Whether it will be unconditional surrender or an equitable settlement, the outcome must be that mining in the Ruhr will be resumed in the near future.

Whether the end of passive resistance in the Ruhr will immediately relieve the coal situation of the German interior is uncertain, but if the terms of surrender are such that it will not, it will be a severe blow to German industry. In any event the coal boom on the import market has, in the common opinion come to an end. Import contracts will hardly be permitted to exceed the demand of the immediate future. Strenuous efforts are being made by Germany's immediate neighbors, Poland and Czechoslovakia to increase their share of coal exports to Germany. Poland is striving to increase her surplus, employing such drastic measures to this end as fining mines for shortage of production. Czechoslovakia has reduced freight rates to promote the movement of coal. Any increase of imports from these two sources would chiefly be at the expense of the British market.

Union Gets Herrin Mine Aug. 20

Acquisition by officials of District 12, United Mine Workers, of the Lester strip mine at Herrin, Ill., the cause and scene of the bloody battle between organized and unorganized labor a year ago, has given rise to much conjecture.

What is the miners' union going to do with the mine now that it has bought it? Frank Farrington, president of the Illinois Mine Workers' organization, frankly says he does not know. He intimates that they may sell it or lease it. A report that the purchase was not in complete accord with the sympathies of the executive board is denied by Farrington, who says that there has never been a question about the wisdom of buying the mine.

Why did the union buy the mine? President Farrington says the purchase was made because the organization thought it would be advantageous to buy it, for reasons which he does not care to explain. From anthracite sources it has been learned that the mine workers' organization was in danger of damage suits totalling more than \$1,000,000, which would and could be collected without difficulty if the Lester interests cared to bring the suits. If the organization owned and controlled the mine there would be no suits.

The property was bought from the Southern Illinois Coal Co. for \$726,000. The entire capital stock of the mine was bought outright and it is now running full blast, with a daily output of between 1,200 and 1,500 tons. The miners' organization will get possession on Aug. 20, and indications are that the mine will run as usual, with the profits going into the treasury of the United Mine Workers.

Production and the Market

Weekly Review

In the absence of other than nominal car shortage, the soft coal market continues in its mid-summer slump. Production of bituminous coal is being maintained a little short of 11,000,000 tons per week of which a million tons is being stocked by consumers or exported. Distress coal is not uncommon and the level of spot prices is steadily but slowly dropping, having fallen 20c. in the last eight weeks.

Buyers are in position to pick and choose and are exercising judgment in the coal they are buying. The Geological Survey estimates that 3,000,000 tons of soft coal were added to the consumers' stockpiles in June, bringing the total in the country on July 1 to 45,000,000 tons, equivalent to 37 days' supply at the June rate of consumption.

Coal Age Index of spot prices dropped one point last week to 195 on Aug. 6, which corresponds to an average price of \$2.36 at the mines. The heaviest decline was in Pocahontas coal which recorded an average drop of 30c., the result mainly of material declines in both mine-run and prepared coals on the Chicago market. In the West, Mt. Olive and Standard quotations declined and Hocking dropped in the East. Pittsburgh, Cambria, Somerset, Kanawha, eastern Ohio, and eastern Kentucky prices gained slightly.

ANTHRACITE CONSUMERS WANT COAL

So far there is no evidence of excitement in the trade over the prospect of a suspension of anthracite mining on Sept. 1. Consumers are no more insistent now than in June that their winter supply be delivered. Receipts of domestic sizes of anthracite by retail dealers have overtaken their deliveries and dealers' stocks are increasing. The demand for substitutes is picking up and coke producers report the receipt of many inquiries and some orders. Byproduct coke plants are reported to be accumulating stocks of coke. Bituminous

coal is finding some market as a substitute for anthracite.

The outlook for steam coal demand is improving as the textile industries in New England show signs of revival and the steel industry begins to talk about going back on heavy schedule as soon as the hot weather is over. Buying of steam coal picked up last week in Ohio and Pittsburgh but demand is so quiet and so carefully limited to low-priced, high-grade coals that mines are being closed for lack of profitable outlets for their product. In the Middle West the number of

LAKE COAL DUMPED
(Net Tons)

	Week Ended July 30	Season to July 30
Cargo	1,071,044	13,928,694
Fuel	56,773	704,390
Total	1,127,817	14,633,084

Compiled from Weekly Report of Geological Survey.

inquiries is increasing. Dealers have begun to take on small lots of domestic coal.

The exceptional rate of production of anthracite of 2,000,000 net tons per week is being maintained without a break. Independent prices are holding up to the high level of July and there is every indication that by the end of August a new high record for production

Estimates of Production

(Net Tons)

BITUMINOUS

	1922	1923
July 14 (6)	4,123,000	10,925,000

(a) Subject to revision. (b) Revised from last report.

will be established for five consecutive summer months.

The Lake demand is unabated and dumpings continue at the rate of 1,000,000 tons a week or better. Dumpings at Hampton Roads for all accounts during the week of Aug. 2, were 438,733 net tons compared with 392,249 tons the previous week. Having been for the past four months below the rate for the previous two years, tidewater movement through this port is now expected to exceed the records of either 1921 or 1922 for August and September.

Midwest Feels an Upturn

The market as viewed from Chicago during the past week had no high lights. A gradual but extremely slow upturn was noticeable. Inquiries are getting thicker and small purchases by dealers are putting a little bottom into a heretofore bottomless domestic market. Steam buyers, many of them with stocks on hand, are demanding nothing but there is just enough call to absorb the small volume of high grade screenings produced in Illinois and Indiana. The

number of Central Illinois operations has been a little larger during the past two weeks but some of the operators who reopened early in July are having hard sledding to place anything with their best lump ranging from \$2.50 to \$2.75 and with screenings at \$1.35@1.40.

Little business in eastern or southern soft coals is done around Chicago just now, except in smokeless. High grade West Virginia smokeless mine run has been in some demand because the price dropped to \$2.50@3 and dealers have been stocking all they could get. Lump and egg did not tumble as far because very little of it is being made, but the old \$6 price is not so well maintained now. Some distress coal has been offered in Chicago as low as \$5.25.

Trade Picks Up in St. Louis

A little activity in domestic coal is the only change in St. Louis. This is principally for good coals at a moderate price. The dealers are pretty well loaded up. It is estimated there must be about 15,000 tons of anthracite stored in the retail yards locally and movement in this is easy. Very little coke and no smokeless is selling. Mt. Olive domestic trade

* Net tons, f.o.b. mines. † Advances over previous week shown in heavy type, declines in italics.

This diagram shows the relative, not the actual, prices on fourteen coals, representative of nearly 90 per cent of the bituminous output of the United States weighted first with respect to the proportions each of slack, prepared and run-of-mine normally shipped, and second, with respect to the tonnage of each normally produced. The average thus obtained was compared with the average for the twelve months ended June, 1914, as 100, after the manner adopted in the report on "Prices of Coal and Coke, 1913, 1918," published by the Geological Survey and the War Industries Board.

is flat and Standard is unusually slow. Wagonload steam is off and carload light, with no steam from the country. Country domestic call is picking up on cheaper coals. No heavy tonnage is involved, but scattering inquiries come in.

Kentucky Suffers Little

Operations in Western Kentucky are not showing much improvement. The field is operating about one-third time. Out of about 176 of the better mines, only about 100 are operating. Car supply is full. Prices continue relatively low, but as good as could be expected considering competition, general conditions, and the season. Mine run is quoted as low as \$1.35 a ton. Production of coal by the stripping process has been increasing in Western Kentucky, and is causing the pit mine operators to do a lot of knocking.

There has been a somewhat improved demand on the Louisville market for steam coal over the past few days, and some nice orders have been placed by large consumers of screenings, including industries and utilities, while inquiry is somewhat better all along the line. This has resulted in advances on Eastern Kentucky screenings, of from 15 to 25 cents a ton, but other sizes are showing no improvement. A few of the coal men are feeling more optimistic and are endeavoring to bull the market by quoting over the market price but selling under it. However, on

prepared sizes \$3.50 appears to be just about the top for fine 6-in. block from the gas coal districts of Eastern Kentucky, and very little coal is moving at that price.

It seems that the principal advance is in screenings, and this is more largely due to reduced production, as a result of many mines being down, and lack of prepared coal orders. Movement to the Lakes has been good.

Northwest Stocks Anthracite

Receipts of coal at Duluth fell off during the week. Only fifty cargoes reached the Head-of-the-Lakes docks. Five of these were anthracite. Last week sixty cargoes arrived of which ten were hard coal. This falling off is attributed to the fact that many docks are unwilling to take a chance of being caught with a large amount of unsalable bituminous on hand. Only twenty-two cargoes are reported on the way from lower lake ports of which but two are hard coal. The delay of the I. C. C. in handing down a rate decision in the Southern Illinois coal matter is causing much apprehension.

The buying situation remains the same. Public utilities are taking a little coal and railroads are helping out some but the general market is dead. Dealers and other consumers are buying from hand to mouth.

Hard coal demand far exceeds the supply. Prices on hard coal are firm at last week's levels. Egg, \$12.50; stove, \$12.80; nut, \$12.85; pea, \$11; buckwheat, \$8.50.

Prices vary a little in bituminous. Youghiogheny and Hocking are the same as last quoted: Lump, \$6.50, run of pile, \$5 to \$5.25 and screenings \$4. The screening market is weak, however, and lower levels are being quoted by some. Splint has strengthened slightly thus: Lump, \$7.50; run of pile, \$6.50; screenings, \$5.25. Kentucky: Miller Creek lump, \$9.50; screenings, \$5.75. Elkhorn lump, \$8.50; run of pile, \$7.25; screenings, \$5.25. Pocahontas is in demand at \$10 for lump, \$7.25 for mine run and \$6.25 for screenings. Smithing is at \$8.

The coal market at Milwaukee is in a more satisfactory condition than it has been for some time, because of fear of a strike in the anthracite field. There is an increasing number of orders for anthracite and for Pocahontas and the domestic grades of bituminous coal. Steam coal is being taken a little more freely, but in small lots. There seems to be no disposition on the part of large consumers to stock up. Prices continue unchanged. The movement by lake to this port has slackened to some extent.

Western Trade Is Spotted

In the Southwest market centering in Kansas City there are signs of the clouds breaking but everybody realizes the coal trade will have to wait at least until the end of the month for trade to regain normalcy. No bills are still on tracks but they are fewer. No changes in bituminous prices have been made but Arkansas semi-anthracite advanced 50c. Aug. 1 to \$6.50 for lump.

In Utah trading is still lifeless except for a little business in the largest cities where dealers have been stocking. Other yard men feel no fear of the car shortage the trade foresees. Industrial coal demand is modest but sugar companies will begin buying for storage soon. Demand for slack at the low prices of \$1.25@1.50 is light.

Demand Slightly Better in Ohio

A slightly better demand for all grades, particularly domestic, developed in the Columbus market. Retail dealers in the larger cities are the heaviest buyers, as rural dealers are unable to move much stock owing to the farming season. Householders who heretofore have hesitated before putting in their winter supply of coal are now showing a disposition to fill their bins believing that prices have reached the bottom. Steam business is showing some briskness, with buyers picking up bargain coal. One of the best features of the market is the activity in school coal. The market for run-of-mine and slack at Cincinnati seemed to have improved slightly during the week. Rejections have fallen off to a considerable degree. This has resulted in a slackening of the amount of distress coal that has to be faced. Accumulations at the various railroad yards have

been reduced. There has been a falling off in the orders for domestic bituminous coals as compared with a month ago. On the other hand the lake business seems to have grown a bit better. River business during the week was good. West Virginia 2-in. lump was quoted at \$2.75, as compared with \$2.50@2.75, and Southeastern Kentucky 2-in. lump at \$2.50@2.75, as compared with \$2.40@2.75. Inquiries in the Cleveland market for steam coals slid off a trifle, operators and jobbers say, but that there was more activity in the retail trade. The holding off on the part of steam coal buyers is based upon general trade conditions and the fact that the supply of steam coal in the middle west will be ample for some time.

The principal development in West Virginia coals has been a slight increase in demand, attributed solely to the present status of the anthracite wage negotiations. Production of smokeless coals is large.

Steam coal has been gradually stiffening in the Pittsburgh district, as well as in the Bessemer and the Connells-ville districts. There is no material change in the volume of demand, and buyers continue to be as cautious as heretofore. The closing of some of the smaller mines, especially those that had to sell their coal in the spot market, caused the betterment, enabling the larger producers, whose output has been increasing to maintain a better front. Numerous inquiries are being received by the Central Pennsylvania operators, together with contract offers for the balance of the year. However, operators are not willing to tie up at present prices, most of them being willing to take chances on the open market. The Buffalo market remains quiet. Industrial business is dull and consumers are not adding to their stocks of coal.

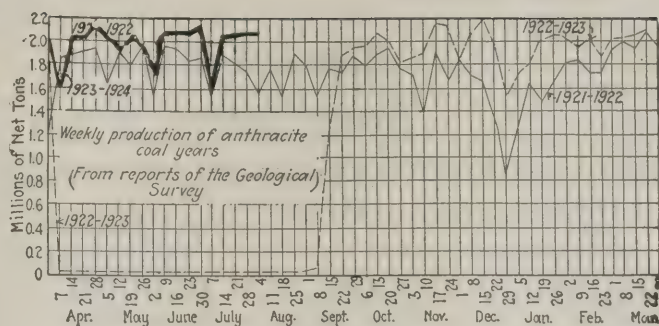

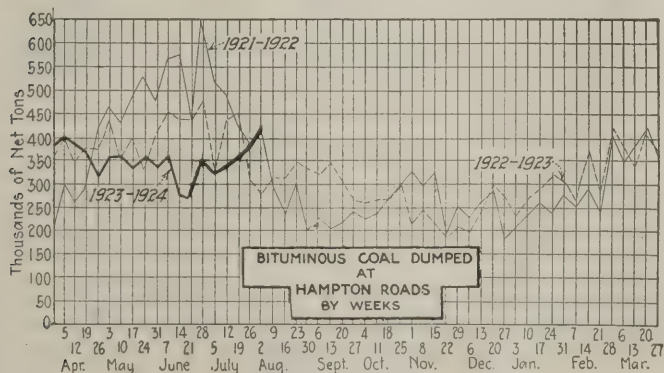

Steam Trade in New England Quiet

In New England the steam trade is practically at a standstill. Except for small purchases there is no buying and shippers are patiently waiting for the long desired turn. The industries here are mostly on short time and consumption for July and August will be far behind expectation. Receipts of the period from January 1st have been greater than for any year since 1918 and when light business and the inroads of oil are considered it is clear there will be only dull business for the next sixty days.

All-rail inquiry is extremely light. Most of the mines producing medium to light grade coals are shut down for much of the time and even those operators who considered themselves amply supplied with contract business through the summer are offering coal for August delivery. Prices are unchanged; the various interests set them at as low a figure as they could justify as early as June 1st and under present conditions there is small inducement to make sales at less than cost.

At the Hampton Roads piers there is a minimum of tonnage on cars. The smokeless agencies are adhering closely to their policy of not mining in advance of sale, and while prices are quoted with reasonable firmness at \$5.25@5.50 for Navy standard grades, it is realized that this range is nominal and that little coal is actually changing hands.

Among retail dealers and in the trade generally there is little interest in any movement to use bituminous as a substitute for anthracite. Consumers in this territory are so constituted that they will not as a rule show any willingness to take bituminous more than a day or two ahead of actual necessity. It would therefore need to be a very serious

emergency before even choice low volatiles would be used in households, as was abundantly shown during last winter.

New York Tidewater Market Dull

Consumers of soft coal in the New York market are making no apparent effort to add to their stocks. The New York harbor is well cleared of distress coal and there is very little offered now. Inquiry for coke is on the increase. The Philadelphia market is quiet, although it is believed the situation in the anthracite regions has induced some of the smaller users of soft coal to take in an extra car or two. The large consumer however, still clings to the belief that he will be able to get all the coal needed when his time to buy comes along. Baltimore complains of lack of business, and no improvement was noticed at Birmingham. Business at the latter place is practically at a standstill. Contract mines are in better shape than those not having such obligations and are working more regularly. The domestic trade is quiet.

Several new inquiries for export coal were reported in the New York market, some involving gas coal to France and others New River product to Norway. The export situation is the most important at Baltimore. One-third of the vessels leaving Baltimore during July were consigned to Canadian ports. These vessels took one-third of the coal shipped from that port during the same period. During the past three months Canada has taken from Baltimore 91,603 tons of cargo and bunker coal.

A fair tonnage of coal is going from the Ohio mines to the Head-of-the-Lakes, while there is some congestion at some of the lower ports. The lake trade at Buffalo is active but not up to that of 1921, loadings in July amounting to 516,500 net tons, as compared with 665,101 tons in the corresponding month of 1921.

Increased Demand for Anthracite

The demand for anthracite domestic coals gradually increased, while retail dealers are calling on producers for larger shipments. Although there is a feeling there will not be a suspension consumers continue to be anxious about getting their winter coal into their cellars. Quotations for independent coals are strong and while some of the smaller operators are reported as asking around \$13.50 for egg, stove and chestnut, the general range seems to be around \$13. The steam coals at New York and Philadelphia are in better shape. The Baltimore dealers are being urged for deliveries by consumers.

"Production of anthracite continues at a high rate, in excess of 2,000,000 tons per week," says the Geological Survey. "The estimated total output during the week ended July 28 was 2,080,000 net tons."

Production of coke during the week ended July 28, says the Geological Survey, is estimated at about 361,000 net tons, as against 360,000 tons the previous week. The cumulative output of beehive coke during the present year amounts to about 11,543,000 net tons.

Foreign Market And Export News

British Coal Output Falling

Coal production in Great Britain continues to decline. The output for the week ended July 21 is reported as 4,600,000 tons, says a cable to *Coal Age*, a decline of 442,000 tons from the previous week, and of 1,197,000 tons since May 19 when it was 5,797,000 tons. Part of the decrease is attributed to the Scotch holidays.

The Welsh coal market is in an undecided state; demands have improved but are not heavy; shipments have declined and recent good weather has led to holiday making and consequent reduction of output. The French State Railways have placed contracts for 30,000 tons, and other orders are from the Norwegian whaling fleet, and the Italian and Australian Governments. It is impossible to meet the demand for anthracite.

The Newcastle market is erratic and accumulated coal is being offered at a discount. Present prices are not being accepted for forward contracts. A number of contracts have been made for August and later delivery.

French Coal Demand Strong

Demand is strong for all grades of French coal. Output is slowly increasing. While the collieries of the Nord and Pas de-Calais have very little available supply on hand, their full production being almost insufficient to take care of contracts already placed. Demand for industrial coals is heavy enough to meet the output.

Retail dealers have difficulty in securing additional supplies. Comparatively little Belgium coal is coming forward. Imports from Great Britain continue satisfactory.

Hampton Roads Situation Improves

Business at Hampton Roads last week was fair, though prices showed a tendency to weaken on the spot. Coastwise trade was comparatively dull, but bunkers and exports held firm.

General coal movement over the piers showed a decided increase, following a lull during June and July. Shippers watched the tendency of the foreign business to increase and viewed the entire situation with optimism in

spite of rumored impending difficulties in the fields.

Shippers expected coastwise movement to begin taking on its usual fall activity, with big business in prospect for the next few months.

French May Imports and Exports

French imports of coke and briquets and exports of coal, coke and patent fuel in May and for the first five months of 1923, according to French Customs returns, follow, in metric tons:

News Items From Field and Trade

ALABAMA

At a recent meeting of the board of directors of the **New Castle Coal Co.**, Birmingham, **Harold McDermott** was elected to a vice-presidency. He will continue to serve as secretary-treasurer, a position which he has held for a number of years.

Moss & McCormick, Birmingham coal operators, were the successful bidders in the leasing by the federal government of 1,840 acres of coal lands in Fayette County, the first lease given by the government in Alabama. Under the terms of the agreement the purchase price of the lease was \$85,000, one-fifth of which was paid in cash, the balance to be paid in thirty days. The lessees guarantee the government a royalty on a minimum yearly output of 20,000 tons at 10c per ton. These lands carry the Black Creek seam of coal, an excellent steam product as well as domestic fuel. There was only one other bidder, the Galloway Coal Co. It is understood that the owners of the lease expect to begin extensive development in the near future.

Arrangements are being made by the **Tennessee Coal, Iron & Railroad Co.** to construct an aerial railway connecting its ore mines with its works and those of its subsidiaries at Fairfield. This railway will result in great savings in freight charges and also expedite the movement of raw material. The work, it is estimated, will cost from \$3,000,000 to \$4,000,000.

COLORADO

J. R. Lemist, pioneer assistant sales manager in the wholesale department of the Colorado Fuel & Iron Co., on account of health and at his own request has been transferred to the Los Angeles office of the company, which has just been reopened. Mr. Lemist will have charge of the sales on coal, coke and steel in that territory. **Douglas Millard**, who also has been an assistant sales manager, now has charge of the wholesale department of sales at headquarters in Denver.

State Coal Mine Inspector **James Dalrymple's** June report shows the tonnage for the state's June production to be 756,557, making the total for the first six months of the year 5,027,151, an increase of 707,843 tons over the same period last year. The coal mining industry employed 11,387 men in June, something less than the average of 13,018 for the year. Fifteen counties report larger production, Las Animas leading with 249,001 tons more than last year, and five counties report smaller production.

The **Big Four Coal & Coke Co.** is making several improvements in its state mine, near Erie. The tippie is being remodeled and the shaft enlarged.

Dr. E. T. Devine, U. S. Coal Commissioner, will spend the greater part of August traveling among the Rocky Mountain and Pacific Coast fields representing the U. S. Coal Commission. The only definite dates so far settled are Aug. 3-4 in the Trinidad, (Colo.) field and Aug. 11-12 in Carbon County (Utah) field. Dr. Devine will attend the annual inter-company first-aid contest and picnic of the employees of the Colorado Fuel & Iron Co. and will address the employees there. From Utah he will proceed to Rock Springs and thence to the Washington coal fields. On his way East late in August he expects to visit the Roundup field in Montana.

ILLINOIS

The Hamilton-Lester Coal Co. of Marion, has instituted suit in Williamson County, for \$17,675 for damages to its mine during the riots of last June. Charles F. Hamilton, president of the company, filed the suit. This is not the same Lester Coal Co. mine at which the riot occurred, when 22 non-union workers were killed, but is a smaller property located nearby.

Charles M. Moderwell, president of C. M. Moderwell & Co., of Chicago, a well-known coal wholesale concern, has been appointed to the Chicago Board of Educa-

tion and was elected chairman by the board at its organization meeting May 23. The board has been in bad odor in Chicago under the régime of Mayor William Hale Thompson so that the new Mayor, William E. Dever, accepted the enforced resignations of the majority of the members and replaced them. Mr. Moderwell is confronted with a big job for the public good.

The mine of the **Paradise Coal & Coke Co.**, at Paradise, has resumed operations after several weeks shut down for repairs.

The **Tamaroa-Little Muddy mine** at Tamaroa has resumed work after a suspension caused by a cave in around the top of the shaft due to excessive rains several weeks ago.

Announcement is made by the **Pure Carbon Co.**, Wellsville, N. Y., of the appointment of a Chicago representative, **John Nangle**, 184 West Washington Street, where he will give personal engineering service on all brush problems and requirements in this territory.

James Robertson, superintendent of the Du Quoin mine-rescue station, is to be one of the judges for the national first-aid contest to be held at Salt Lake City, Utah, the latter part of August. The judges for this contest are appointed by the federal department of mines and only men with the highest ability and experience are chosen.

The mine of the **Missouri-Illinois Coal Co.** at **Rentchler Station**, near Belleville, has been closed by State Mine Inspector **James R. Richards** and County Mine Inspector **W. A. Wilson**. The mine was closed because of the absence of a means of escape for men up the air shaft of the mine. Sometime ago the steps in the air shaft of the mine were removed for repairs and for some reason were never replaced.

Many mines in the **Standard field** are shut down and those which are still working are only operating from one to three days per week. Following is list of mines in the Belleville district which are not working at present. Belleville, 5; Collinsville, 2; Freeburg, 2; O'Fallon, 2; Marissa, New Athens, Lenzburg, Lebanon and Breese, one each.

INDIANA

The **Metzner Bros. Coal Co.**, Fort Wayne, has filed a preliminary certificate of dissolution.

Elmer Pope of Linton, has been appointed receiver of the **Kathleen Coal Co.**, which operates a mine in Greene County. Suit for receiver was filed in Superior Court in Vigo County.

Alfred Kauffmann, vice president of the Link-Belt Co. and general manager of its Indianapolis plants, was elected a director of the **Fletcher Savings & Trust Co.**, recently.

The **Big Bend Coal Co.** has been incorporated to mine and deal in coal at Brazil. It has a capital of \$150,000 preferred and 750 shares common, no par. The directors are **Louis Clements**, **Rowland Rowland** and **John Magenhardt**.

John Stevely and **Sam Wilton**, deputy mine inspectors, announced recently that their investigation had shown that **J. E. Fudgett**, engineer, was not responsible for the accident at the **Vernilion Co.'s** mine, near New Goshen, July 20, in which thirteen men were injured, one fatally, when the cage fell 125 ft. to the bottom of the shaft. The inspectors found that six set-screws in the balancing plate in one of the cylinders were loose and prevented proper compression so that when the engineer threw the lever to check the descending cage it failed to hold.

The **Crawford & McCrimmon** foundry and machine shops, Brazil, operated by a receiver for several months, are in the hands of Brazil stockholders and a reorganization will be effected, putting the factory on a better financial footing. A receivership, which was the result of a petition of **Edward Shirkie**, of Terre Haute, a stockholder, was dismissed in the Vigo Superior Court with the settlement of all claims against the company. The company manufactured mine engines, mine pumps and mine fans extensively.

Asserting that he was dragged from his home in Jasonville in the spring of 1921 by a group of miners because he engaged in work forbidden by the Jasonville local, that he was threatened with death and hanging and driven from his home with the threat of death if he returned, **James Gatherum** filed suit in federal court July 24, asking damages of \$50,000 and an injunction against interference with his work and home life. The suit is brought against **Merritt Myers** and thirty-two members of Local No. 24 of the United Mine Workers.

KANSAS

The second step toward putting an end to "Progressive Miner" radical activities in the Kansas district was taken June 27 by the district board of District 14, United Mine Workers, when it gave the names of U. M. W. A. members active in the "Progressive" meeting at Franklin, May 29, to their respective locals for action. The board suspended all members who attended the Franklin meeting shortly after it was held. This action was upheld by the international board at its recent meeting at Indianapolis. The locals will be required to try the men whose names were submitted to them. If the suspensions by the district board are upheld, the only recourse of the suspended miners will be to the international executive board to obtain reinstatement.

KENTUCKY

The **Rainbow Coal Co.**, Louisville, capital \$25,000, has been incorporated by **Charles D. Salyers**, **F. S. Salyers**, and **Donnelly B. Salyers**. The liability limit is placed at \$100,000.

The **Glidden-Decker Coal Co.**, of Barbourville, has increased its capital stock from \$10,000 to \$50,000.

The **Hampton Coal & Phosphate Co.** has been incorporated in Livingston, by **George Hamburg**, **R. L. Crawford** and **E. M. Nelson**.

The **Louisville Times** in a recent editorial highly complimented the work of **Willard Rouse Jillson**, director of the Kentucky Geological Survey, and recommended that the department, which has been starved for money to carry on its work, be given funds with which to carry out its work.

Mayor **Houston Quinn**, Louisville, has named **Louisville delegates to the American Mining Congress** and national exposition of mines and mining equipment, Milwaukee, Wis. Sept. 24 to 29. The men named include **F. M. Sackett**, **R. C. Tway**, **H. H. McBratney**, **Kenneth U. Meguire**, **C. D. Glass**, **M. G. Sackett**, **C. E. Reed**, **M. S. Barker**, **H. T. Carmichael** and **W. L. Caldwell**.

A report to be submitted by the U. S. Engineers of this section shows that a material increase in river traffic was noted on the **Kentucky River** during 1922. Much of this increase has been due to efforts of the **Inland Waterways Co.**, Louisville, which operates mines on the Kentucky river, and a fleet of boats, bringing coal and oil down to the Ohio River, for transportation in larger tows to both upper and lower river points.

William Scroggins has been released from custody at Hartford in connection with the shooting of **Opal Wells**, son of a prominent coal operator. **Charles Scroggins**, uncle of **William Scroggins**, a coal miner and garage mechanic, has been held under bond of \$1,000 for the Grand Jury. Evidence showed that the shooting was in self-defense, Wells having drawn a gun and started the shooting.

The **St. Bernard Mining Co.**, of Madisonville, is starting to spend some money on its retail yards. The Nashville (Tenn.) yard has been improved, while the Paducah, Ky., yard is being enlarged, and will have a coal unloading trestle. At Louisville Manager **W. B. Gathright** has started work on a trestle at the Logan Street yard, and will also install one at the Kentucky Street yard, which will be enlarged. Under the trestles the yards will be concreted, and equipped with retaining walls, and loading to trucks will be handled by portable conveyors.

MASSACHUSETTS

Fuel Commissioner Eugene C. Hultman of Massachusetts warns consumers that in order to protect themselves against the consequences of a strike in the anthracite mines they should begin to put some bituminous coal into their bins. In spite of the brisk buying by consumers, Mr. Hultman says, the stocks on hand in the dealers' yards have increased nearly 100 per cent since April 1. At that time there were on hand 181,887 net tons. During April, May and June 1,523,790 tons was received. In

the same three months the dealers delivered 1,344,634 tons, leaving a balance on hand July 1 of 361,049 tons. "At the present rate of receipts," Mr. Hultman points out, "we should receive a total of about 1,000,000 tons of domestic anthracite in July and August. It is therefore evident that Massachusetts cannot physically receive more than one-half of its year's requirements of anthracite before Sept. 1."

Mayor Curley of Boston has sent Frank P. Rock, superintendent of the supply department, to Pennsylvania, to make arrangements to buy 25,000 to 50,000 tons of anthracite for Boston. In his order to Mr. Rock, the Mayor said: "The best interests of the people of Boston require that precautionary measures be taken in the event that the city, for the protection of the public, is again required to engage in the purchase, sales, and distribution of coal." In that the substitution of oil for coal has reduced the needs of city departments, only about 5,000 tons of anthracite will be required for municipal buildings, and about 100,000 tons of bituminous, against the former total of about 160,000 tons purchased annually. Mr. Rock's errand, however, is to provide for Boston householders.

MICHIGAN

The Cooper Coal Co., a newly organized corporation with a capital stock of \$500,000, announces it will drill in several townships near Saginaw and will work at least three mines soon. Otto L. Dittmar is president.

MINNESOTA

At the National Smoke Prevention Association convention in Minneapolis recently, B. J. Mullaney, former Commissioner of Public Works of Chicago, said that of the nation's fuel bill of three billion dollars a year, 95 per cent is wasted in unburned gases, smoke and sediment. He suggests that the substitution of gas fuel burned in its raw state will save 65 per cent, and the electrification of the railroads will save the remainder. Lignite also was given favorable mention as a smokeless fuel by W. A. Pittsford, chairman of the public service committee.

MISSOURI

The Mound Valley Coal, Gas and Oil Co. has been incorporated at Beldon, and will prospect for coal and other minerals. Its capital stock is \$100,000 and its incorporators are Arthur Hesse, W. Marseillon and A. A. Neimeyer.

Fred Wreidt, who recently opened a coal shaft on an 80-acre farm southwest of Bevier, has disposed of his holdings to a Bevier coal company which is leasing more acreage. The company will run a railroad spur to its new holding and will equip it electrically.

The Riverside Coal & Iron Co. has been incorporated with a capital of \$250,000. The company is headed by Edward F. Goltz, Democratic national committeeman, who has recently acquired control of the government fleet of barges on the Mississippi River. The purposes of the corporation are to manufacture and sell iron, steel, coke, etc.

Robert Carr and associates have leased the Reese coal mine near Rich Hill. The plant has been cleaned up and has been put back in operation. When the mine was closed down some time ago 50 miners were employed there. Reese goes to Illinois to become manager of the McComb mine property near Danville.

MONTANA

The largest coal lands lease in Montana in recent years has just been made by the government to Lyman L. Miller of Lead, S. D. The lease covers a 1,600-acre tract in Carbon County near Joliet containing the Bridger seam.

NEBRASKA

Another vein of coal has been discovered in the southwestern part of the state, near Auburn. Many veins have been found in that locality and one southeast of Pawnee City has been mined for several years with profit.

NEW YORK

A certificate of incorporation has been filed in the office of the Secretary of State at Albany by the **Hickory Grove Coal Mining Corporation, Rochester.** The directors

are William O. Boswell, 91 Berkley Street, Rochester; Jacob M. Floesch, 3 Argyle Street, Rochester; and Lawrence H. Fitch, 550 Park Ave., Rochester.

Bids will be received until 2 P.M., Aug. 13, by The United Shipping Board, New York City, for furnishing bunker coal for the vessels of the United States Lines at the Port of New York, for eight months from Aug. 25 and alternately for one year. Coal to be furnished must be Pool 1, Pennsylvania or West Virginia, or coal from the mines now in the U. S. Navy acceptable list. The bidder must be prepared to furnish not more than 15,000 tons per month and must give price f.a.s. New York harbor.

C. E. Tuttle, president of the Tuttle Coal Corporation of New York City, resigned as a director of the Pittsburgh & West Virginia Ry. at a meeting of the Board of Directors held on Aug. 2 and was elected president of the **Pittsburgh Terminal Coal Co.** A. W. Calloway, formerly president of the Pittsburgh Terminal Coal Co., was elected chairman of the board. W. C. Atwater, of New York, was elected to succeed Mr. Tuttle on the Board of Directors of the railway company.

W. A. Marshall & Co., of New York City, have taken over the output of the Fort Grand mine of the Fort Grand Coal Co., at Lowesville, W. Va., and will market that coal. The mine has an output of about twenty cars per day.

NORTH DAKOTA

Major Stanley Washburn, of Lakewood, N. J., president of the North Dakota Lignite Coal Operators' Association and vice-president of the Washburn Lignite Coal Co., in a recent address to bankers at Bismarck, declared that North Dakota this year will mine and sell 2,000,000 tons of lignite coal and in 1933 the state should be mining for its own use and for export between 10,000,000 and 15,000,000 tons of coal. He said that with the backing of the bankers the development of the lignite mines could be carried forward with amazing swiftness.

OHIO

The Black Diamond Coal Mining Co., Cincinnati, has been incorporated with a capital of \$100,000 to mine and sell coal, coke and minerals. Incorporators are W. B. Cramer, L. N. Birk, Calvin Cramer, N. C. Kelly and Arthur W. Gordon.

Suit has been filed at St. Clairsville, county seat of Belmont County, by the **Central National Bank Savings & Trust Co., of Cleveland,** against the **Belmont Collieries Co.,** for the foreclosure of a mortgage covering \$355,000 in bonds, the plaintiff being the trustee.

The International union of the United Mine Workers has revoked the charter of the local union at the Big Run mine, south of Bellaire. The revocation was made at the request of President Lee Hall, of Ohio, according to an announcement at the headquarters of sub-district 5, following refusal of the members to return to work at the Big Run mine. Several weeks ago the miners at Big Run engaged in a strike, which was declared by sub-district officials to be illegal and without the sanction of the union. After a protracted conference, however, an agreement was reached and the miners resumed work, but went out again when \$1 was checked off their pay as a penalty for the illegal strike. The membership of 381 miners in the union is affected by the revocation of the charter.

Buying of coal for public utilities, institutions and governmental departments will soon be in full swing in Columbus and Ohio. Bids have been asked for 3,500 tons of coal by the County Commissioners, of which 1,000 tons are for the court house, 2,000 tons for the county infirmary and 500 tons for the Memorial Hall. This will be either mine-run or lump. State Purchasing Agent J. P. Brennan will soon ask for bids for between 150,000 and 200,000 tons of coal for the various state institutions under the charge of the Department of Public Welfare. Only Ohio-mined coal will be purchased and specifications provide for either mine-run or nut, pea and slack. Steps will be taken to obtain a large part of the supply immediately upon the award of the contracts, as storage space for 100,000 tons is available. The Columbus City Council has authorized the purchase of approximately 22,650 tons of coal for the municipal light plant, water works department and garbage reduction plant. The supply is to last for the remainder of the current year.

OKLAHOMA

Test holes near Porter show a 20-in. bed at a depth that will permit stripping.

The Crowe Coal Co., of Henryetta, has closed its mine, known as Whitehead No. 2, one of the oldest mines in the Henryetta district and one of the best producers. No explanation is given for the shutdown, except that there is no demand for the total output, and that production must be curtailed.

The Calvert Coal Co., of Rockdale, has sold its lignite mines and 300 acres of land underlaid with lignite, situated two miles east of Rockdale, to the **Sparks Coal Co.,** of Rockdale. The consideration involved in the transaction is withheld. The property is developed to the extent that two shafts are now being worked, and the output is about 200 tons a day. The Sparks Coal Co. now owns some land at Hicks, eight miles south of Rockdale, on which it has been working one shaft. The Sparks company announces that it will at once undertake to develop the Calvert property.

PENNSYLVANIA

The Bethlehem Steel Corporation has under consideration the erection of two more batteries of coke ovens at Johnstown. These will be of the type required to fit in with those recently erected.

Harry Montz, formerly connected with the general manager's office of the Lehigh Valley Coal Co., recently was appointed mining engineer for the company with office in Wilkes-Barre.

Notices of the charge of \$1 a month dues, abolition of the button system and the bonding of local officers in District 1, United Mine Workers, have been mailed out from the district headquarters by District Auditor John Gallagher of Wilkes-Barre. The action on these matters was taken at the tri-district convention in Wilkes-Barre.

The Glen Alden Coal Co. is rapidly preparing its newly acquired shop and foundry for occupancy by its general repair and construction departments. The new shop is located in West Pittston and formerly was owned by the Exeter Machine Works.

The Philadelphia & Reading Ry. Co. is offering a prize of \$25 for the best suggestion for fuel conservation submitted by an employee. The offer is made in connection with a contest being conducted by the International Fuel Association for the best plan of railroad fuel conservation, for which \$100 is being offered. The latter contest is open to railroad employees on any railroad and will close Aug. 31.

The City Council of Harrisburg is discussing a small tax on all coal landed along the improved section of the river front. The reclaimed anthracite from the Susquehanna River is brought by boat to the city and the councilmen hold that it is wrong to allow the dredgers the unrestricted use of the river front.

Emil Johnson, Ed Gustafson and Gus Carlson, employed by the Rinn-Sutter Coal Co. at Plumville, near Punxsutawney, were drowned in a narrow manway several hundred feet under the ground on July 30. A terrific downpour of rain sent Plum Creek over its banks and poured thousands of gallons of water into the shaft. The bodies were recovered the next day.

A state charter has been issued to the **Keystone Fuel Co., Inc.,** of Scranton, with a capital stock of \$50,000. S. M. Hawks, Carbondale, is treasurer and one of the incorporators, the others being F. W. Moser, Scranton and James H. Rolles, Olyphant. A charter also was issued to the **Portage-Sonman Coal Co.,** Portage, capital, \$10,000; incorporators, M. M. Griffith, Portage, treasurer; Paul Nelson and H. D. Nelson, Portage.

The Pennsylvania Department of Mines, according to a report made by Secretary J. J. Walsh to the State executive board, is effecting a material saving in administration through changes in allowances to mine inspectors for expenses. Under the plan of concentrating state offices in the Capitol, the department's leased office space in a building at Harrisburg has been given up at a saving of approximately \$5,000 a year. The cutting down of expense allowances will save the State \$17,500 in two years.

One man was killed and three others wounded in a hold-up on a Laurel Line train near Moosic July 30, when the payroll of the West End Coal Co., of Moosic, amounting to \$70,126, was stolen. The dead man was Edward Murphy, of Scranton,

while those injured included Arch Hen-shall, Scranton, paymaster for the West End Coal Co.; P. J. Durkin, of Scranton, motorman, and Philip Scribner, Thomas Thomas, assistant paymaster of the Coal Co. and Thomas J. Welby and Joseph W. Berwick, coal company guards, escaped injury.

Charles S. Goldsborough, of New York, has been elected president of the **Pennsylvania Coal Co. and the Hillside Coal & Iron Co.** to succeed Captain W. A. May, who died recently. A. K. Morris will continue as vice president with William P. Jennings and Joseph P. Jennings continuing as superintendents. Mr. Goldsborough for the past ten years has been assistant to F. E. Underwood, president of the Erie R.R. Prior to that he was general superintendent of the New York and Susquehanna R.R. and also was superintendent of the Tioga division of the Erie R.R.

It is unofficially reported that **no new state mine inspector will be appointed for the Eighth, or Pittston, district** to succeed Robert Johnson, who resigned recently. The collieries of the district have been divided between Inspector McDodge, of Rendham, and Inspector Curtis, of Forty Fort, and it is intimated that this arrangement may be made a permanent one. When Chief Walsh took charge of the Department of Mines some months ago it was reported that retrenchments would be brought about by the consolidation of districts. If this new arrangement continues permanently it will be the first time in 30 years that Pittston has been without a resident mine inspector. At one time two inspectors were stationed there.

Insisting that men in its employ shall check their time on the way in and out of the mines led to a **strike at two collieries**—the Nottingham and Washington of the Lehigh and Wilkes-Barre Coal Co. recently. The checking system, is ordinarily known as "pulling your peg." By it the company officials are able to tell exactly how many men are underground and also can identify them. The men oppose it as an attempt to restrict their liberty. They say the last wage agreement said nothing of the check system.

T. R. Johns, general manager of the Bethlehem Mines Corporation, the coal mining subsidiary of the Bethlehem Steel Co., at Johnstown, has made the following appointments in his organization effective Aug. 1: **Samuel Steinbach**, division superintendent of the Johnstown division, becomes assistant general manager of coal mines for all divisions. **Frank Horton** from superintendent of the Johnstown mines to division superintendent of the Johnstown division, which, in addition to the Johnstown mines, includes the Wehrum and Slickville operations. **Duncan May**, mine superintendent of the Rosedale mine, appointed superintendent of all Johnstown mines. **Edwin Roberts**, superintendent of Nos. 73 and 74 mines, will succeed Mr. May as superintendent of No. 72 mine. **Robert Owen Robertson**, foreman of No. 71 mine, will succeed Edwin Roberts as superintendent of Nos. 73 and 74 mines. **George Alberter** has been promoted from foreman at No. 71 to the position of foreman of No. 71 mine. **William A. Thomas**, fireboss at No. 71 mine, has been appointed assistant foreman of No. 71 mine.

TEXAS

The **Western Securities Co.**, of which J. G. Puterbaugh, McAlester, Okla., is president, will develop a 1,330-acre deposit of lignite near Rockdale, which is reported to be from 8 to 15 ft. in thickness.

Dallas retail coal dealers have united in a campaign to urge early buying of fuel for next winter's consumption, it is announced by Harry Pennington, Sr., of Dallas. Mr. Pennington explains that the Dallas coal men have launched this campaign in co-operation with the policies of the various government bureaus "as a matter of insurance, a help to transportation facilities, and an aid in stabilizing the working time of the coal miners."

Resumption of operations on the properties of the Western Securities Co. near Rockdale, Tex. is indicated in the construction of a railroad switch track from the main line of the **International-Great Northern** to the mine properties. These lignite mines were formerly owned by Federal Fuel Co. and sold to the Standard Coal Co. and then acquired by the Western Securities Co., of which J. G. Puterbaugh, of McAlester, Okla., president of the McAlester Fuel Co. and also president of the Oklahoma Coal Operators' Association, is Southwestern representative. The properties embrace a large area of valuable lignite land and two mine shafts. The lignite under

some of the land is sufficiently near the surface for stripping operations to be carried on with profit.

UTAH

The **Western Coal & Iron Co.'s** affairs have been placed in the hands of the Tracy Loan & Trust Co. as receivers.

VIRGINIA

The case of the **Norfolk & Western Ry. against the Pan Handle Coal Co.** for collection of demurrage charges alleged to have accumulated during the last four years has been **partly settled out of court**. Certain portions of the charges were agreed on, the remainder being allowed to pass through the processes of litigation. Fourteen other cases are dependent on the outcome of this suit.

WEST VIRGINIA

The **Boone County Coal Corporation**, of Sharples, has contracted with the Roberts & Schaefer Co. for a steel tippie complete with loading booms to be installed at its mine at Monclo.

Fire late in July was responsible for the complete destruction of the repair shops of the E. E. White Coal Co. at Stotesbury, in the Winding Gulf field, the loss amounting to about \$100,000. Almost before the ashes of the old buildings were cool the company had begun the construction of a new and more modern structure to replace the one destroyed by fire.

The **Deep Run Coal Co.**, of Cumberland, Md., is opening a new mine in the Elk Garden district of West Virginia, involving the expenditure of approximately \$300,000 under the direction of Benjamin Robinson, Sr., of Frostburg, consulting engineer of the company. The company is operating in a territory embracing about 2,500 acres, including some very rich coal land. Three mines are already in operation and this concern expects to have the fourth ready for production soon, as the main heading is nearly completed and construction work is far advanced on a new tippie. An 11-ft. incline also is almost ready for use. At the beginning of operations the new mine will have an output of about 500 cars a day, which will be increased as the mine is further developed. One hundred and twenty-five men are at work, but the number will be increased after the new mine begins to operate. The company has a production of about 300 tons a day at its other mines. All the plants of the company are operated on an open-shop basis. The president of the company is C. H. Lantz, of Piedmont, W. Va.; W. R. Nethken, of Cumberland, Md., is the vice-president.

The **Dwyer Coal Co.**, which has been engaged in the production of coal near Coalburg in the Kanawha field for a number of years, is opening a new mine near Chapmansville, where the company recently acquired about 1,000 acres of coal land so located as to make it possible to mine from a rise and thus insure excellent drainage and also to make it possible to handle the coal at a minimum of expense. With a view to securing the largest production possible, the company is building a modern colliery and also attractive quarters for its employees. John G. Dwyer will have charge of the mines.

Arguments were begun in the Circuit Court of Logan County before Judge Robert W. Bland on Thursday, Aug. 2, on a plea for a change of venue for **Harold W. Houston**, chief counsel for District 17, United Mine Workers, charged with complicity in the armed march on Logan and Mingo counties in 1921. Several months ago Houston was indicted by a grand jury in Logan County as an accessory to the murder of John Gore, George Munsky and John Cafalgo, deputy sheriffs, killed in a skirmish on Blair Mountain. Counsel for the United Mine Workers also are asking for a change of venue for Edgar Coombs, alleged to have been a participant in the armed march and who, according to the testimony of the Rev. J. E. Wilburn in the Blizzard case, fired the shot which killed Gore. Although changes of venue were granted in connection with others indicted in Logan County without any resistance on the part of the state, it has been asserted by Prosecuting Attorney John Chafin of Logan County that the state will oppose any change in venue in the case of other defendants, owing to the fact that in every instance where there has been a change of venue an effort has been made through propaganda and otherwise to influence the opinion of potential jurors in the various counties to which the various "armed march" cases have been transferred.

WYOMING

The Secretary of the Interior has directed the U. S. Land Office at Douglas, Wyoming, to offer for lease a tract of public coal land in Wyoming containing 1,720 acres. The land is in the Wadman district of the Wind River coal field in Natrona County. The lease will be at a government royalty of 8 cents per ton for coal mined, a minimum investment in mining operations of \$100,000 during the first three years of the lease, and a minimum production of 15,000 tons of coal a year beginning with the fourth year of the lease.

WASHINGTON, D. C.

The **National Coal Association Policy Committee**, to serve during the present year, as appointed by President Brydon, is as follows: Walter Barnum, treasurer, Pacific Coast Company, New York; C. E. Bockus, president, Clinchfield Coal Corporation, New York; J. G. Bradley, president, Elk River Coal & Lumber Co., Dundon, W. Va.; J. C. Brydon, president, Quema-honing Creek Coal Co., Baltimore; B. M. Clark, president, Rochester & Pittsburgh Coal & Iron Co., Indiana, Pa.; Ira Clemens, president, Clemens Coal Co., Pittsburg, Kan.; T. B. Davis, president, Island Creek Coal Co., New York; E. L. Douglass, vice-president, First Creek Mining Co., Cincinnati; T. F. Farrell, second vice-president, Pocahontas Fuel Co., New York; George H. Francis, secretary, Keystone Coal & Coke Co., Greensburg, Pa.; Michael Gallagher, general manager, M. A. Hanna Co., Cleveland; R. H. Gross, president, New River Co., Boston (acting for Mr. Bradley during the latter's absence in Europe); T. W. Guthrie, president, Hillman Coal & Coke Co., Pittsburgh; George B. Harrington, president, Chicago, Wilmington & Franklin Coal Co., Chicago; Moroni Heiner, vice-president, U. S. Fuel Co., Salt Lake City, Utah; John S. Jones, president, Sunday Creek Coal Co., Columbus, Ohio; C. H. Krause, vice-president, Willis Coal & Mining Co., St. Louis; F. W. Lukins, president, Farmers Fuel Co., Kansas City, Mo.; A. M. Ogle, president, Vandalia Coal Co., Terre Haute, Ind.; J. B. Pauley, vice-president, J. K. Dering Coal Co., Chicago; P. H. Penna, secretary, Indiana Bituminous Coal Operators' Association, Terre Haute; P. J. Quealy, president, Gunn-Quealy Coal Co., Kemmerer, Wyo.; H. N. Taylor, president, U. S. Distributing Corporation, New York; D. B. Wentz, president, Stonega Coke & Coal Co., Philadelphia; F. W. Wilshire, vice-president, Consolidation Coal Co., New York, and S. L. Yerkes, vice-president, Grider Coal Sales Agency, Birmingham, Ala.

Obituary

Charles C. Beury, one of the leading operators of the New River coal field, well known throughout southern West Virginia, a pioneer in the smokeless regions, whose early training was received in the anthracite fields of Pennsylvania, died at Lewisburg, W. Va., Tuesday, July 31, after a lingering illness. He was held in such affectionate regard by both those in and out of coal circles that his death, expected though it had been, was a distinct shock. Charles C. Beury had been an operator in the New River field for more than 40 years. In association with his brother, the late Joseph Beury, he had an active part in developing the smokeless fields of southern West Virginia. He was president of the Beechwood Coal & Coke Co. and was also heavily interested in the Turkey Knob Coal Co., the Branch Coal & Coke Co., the Coal Run Coal Co., and also was a stockholder in the Flat Top Coal Co. operating in the Pocahontas field and in other companies in that field. Mr. Beury had been president of the New River Coal Operators' Association in 1918 and 1919 and at the time of his death was a member of the executive committee as well as being treasurer of the association. He is survived by his widow, Bessie A., daughter of former Governor George W. Atkinson of Charleston, and three daughters, Nancy Ellen, Christine and Catherine; one son, Charles C., Jr.

Association Activities

Elijah Coles, recently elected president of the **Texas Retail Coal Dealers' Association** at the annual convention in Galveston, on his return to Houston announced that

he will soon launch a state-wide campaign to increase the membership of the association, and hopes to have every retail coal dealer in the state become a member. Allotment of the proper kind of cars for moving coal and better routing of cars also will be sought by the association, he said. Mr. Coles expressed the view that retail coal prices are not going up appreciably during the coming winter, nevertheless he urged all householders to lay in their supply of winter coal now.

Reduction in freight rates on coal from some fields, proposed reduction from others and the competition of southern West Virginia coal led to a meeting of the directors of the Northern West Virginia Coal Operators' Association, and representatives of the Monongahela Coal Association, Upper Potomac Operators' Association and the Northern Panhandle Coal Association at Deer Park late in July for the purpose of considering ways and means to meet the competition and disadvantage brought about thereby. It is feared that as a result of the revision in rates much steam coal from West Virginia may be eliminated from the markets of Ohio, Indiana, Illinois and Michigan. The directors at the meeting had the advice and counsel of E. J. McVann, of Washington, D. C., on traffic matters. No announcement was made as to what action it was proposed to take.

Publications Received

Geology and Mineral Resources of the Morris Quadrangle. by Harold E. Culver, Department of Registration and Education Division of the State Geological Survey, Urbana, Ill. Extract from Bulletin 43. Pp. 114; 7x10 in.; illustrated; 3 plates.

Godfrey Conveyors. The Godfrey Conveyor Co., Elkhart, Ind. Pp. 20; 8x11 in.; illus. Describes the unloading of coal from bottom dump cars into a chute underneath the railroad track, from where it is conveyed by gravity into a bucket, which in turn is elevated and carried to a storage pile, bin or conveyance.

Taylor's Spiral-Riveted Pressure Pipe. American Spiral Pipe Works, Chicago, Ill. Catalog No. 22. Pp. 75; 8x10 in.; illus. The fore part of this catalog is devoted to a description and letters from companies who have had this pipe in service for lengthy periods, and the latter part gives prices and tables showing flow of water through pipes. The forged joint permits the pipe, regardless of size or length of lay, to follow the contour of the ground.

Traffic News

The recent Virginian decision of the I. C. C. had no influence on the Montana Railroad Commission late in July when it ordered the C. M. & St. P. Ry. to build a 1,500-ft. spur from Roundup yards to the new mine of the Gilbert-Crawford Coal Co. The mine expects to begin at 50 tons a day and attain 500 tons eventually. The road objected on the ground that enough coal was being produced in Montana, that the coal company did not know the exact nature or extent of its deposit and that the spur would have no public value. The coal company asserted that there is a wide market for its output and that the spur would be public. The state commission felt the railroad was refusing rail connection to the mine because "it is a public fact that" the railroad's relations with the competing Roundup Coal Mining Co. "are very intimate."

Alabama railroads will appear before the Public Service Commission, Aug. 23, at a hearing of a proposed new schedule of rates on coal and coke moving between points in the state. The schedule prepared by the commission carries a material reduction in most instances over the tariffs now in effect.

The number of loaded coal cars handled by the Norfolk & Western in June—114,031—was the highest for any month of 1923, yet they were 12 per cent below the tonnage handled by the same road during June, 1922, owing to the fact that there was a large production of non-union coal during the early part of the 1922 strike and before the strike of shopmen put railway equipment out of commission.

Fewer freight cars were in need of repair on July 15 than at any time since December, 1920, according to the Car Service Division of the American Railway Association. The number in need of repair on July 15 was 183,621, or 8.3 per cent of the number on line. This was a decrease of 1,790 compared with the number in need of repair on July 1, this year, at which time there were 190,411, or 8.4 per cent. Class 1 railroads of the United States had in need of repair on July 15, 11,855 locomotives, or 18.6 per cent of the total number on line. This was an increase of 405 over the total number on July 1, at which time there were 11,450, or 18 per cent. The railroads on July 15 had 2,437 locomotives in good repair and stored away to meet increased traffic demands later in the year. This was an increase of 256 over the number in storage on July 1. During the first fifteen days in July 18,290 locomotives were repaired and turned out of the shops.

Coming Meetings

The American Institute of Mining and Metallurgical Engineers will hold its annual meeting in Canada. The meeting will start Aug. 20 at Toronto and end Aug. 30 at Montreal. Secretary, F. F. Sharpless, 29 West 39th Street, New York City.

Rocky Mountain Coal Mining Institute will hold its summer meeting Aug. 27 to 29 at Salt Lake City, Utah, in conjunction with the International Safety and First-Aid Meet. Secretary, Benedict Shubart, Denver.

New York State Coal Merchants' Association will hold its annual convention on Sept. 10-12 at Sacandaga Park, N. Y. Executive secretary, G. W. F. Woodside, 250 Arkay Building, Albany, N. Y.

Oklahoma Coal Operators' Association will hold its annual meeting Sept. 13 at McAlester, Okla. Secretary, A. C. Casey, McAlester, Okla.

The American Mining Congress will hold its twenty-sixth annual convention in conjunction with the National Exposition of Mines and Mining Equipment, Sept. 24-29, at the Milwaukee Auditorium, Milwaukee. Secretary, J. F. Callbreath, Washington.

National Safety Council will hold its twelfth annual safety convention at the Buffalo Statler Hotel Buffalo, N. Y., Oct. 1-5. Secretary, W. H. Cameron, 168 No. Michigan Ave., Chicago, Ill.

The West Virginia-Kentucky Association of Mine, Mechanical and Electrical Engineers will hold its annual meeting Oct. 19-20 at Huntington, W. Va. Secretary-treasurer, Herbert Smith, Robson-Prichard Bldg., Huntington, W. Va.

Coal Mining Institute of America will hold its annual meeting Dec. 19, 20 and 21 at Pittsburgh, Pa. Secretary, H. D. Mason, Jr., Chamber of Commerce Building, Pittsburgh, Pa.

COAL AGE

The Only National Paper Devoted to Coal Mining and Coal Marketing

C. E. LESHER, *Editor*

Volume 24

NEW YORK, AUGUST 16, 1923

Number 7

Do Something! Do What?

MASSACHUSETTS legislators are going to settle the moot anthracite question by the simple method of boycotting that fuel. "You can't play in my back yard," say the members of the Joint Special Coal Investigating Committee of Massachusetts, "unless you miners and operators quit scrapping." The Committee says it will recommend that all New England abandon the use of hard coal and turn permanently to substitutes, greatly favoring the smokeless coal of West Virginia.

New England can, if it must, get along without anthracite, but it will not. The convenience and comfort of anthracite have made the householders in that chilly clime habit-bound to its use. Welcome as the news may be and heartening as well, to the smokeless producers that the committee is going to add some millions of tons annually to their markets, they are too familiar with the situation to send the coal up there before it is ordered.

Anthracite has, as the Committee states, become expensive, but so have shoes and cotton goods, "almost to the point of luxury." If it is so simple to induce the New Englander to adopt soft for hard coal, why indulge in the luxury longer? Let the committee poll its constituency to find how willing they may be to forego the luxury fuel. If it is so easy to convert the habits of the people, why should there be "further suffering for many and possibly death" if the hard-coal miners strike in September?

The committee is hitting the nail on the head when it says that "the patience of the anthracite consuming public is strained to the breaking point. It will brook no stoppage in its fuel supply." But what is the public going to do about it? Tell the President to take over the industry? and if he does, will Boston citizens volunteer a trip to Scranton and dig coal, as they volunteered and did public service at home when their police force struck?

This committee says it takes no sides in the present controversy, believing that both sides should adopt a more conciliatory attitude. The check-off is a clean-cut issue, either the operators grant it, or they don't; either the union drops its demand or strikes for it. There is no half way measure, no compromise settlement here. Wherein enters the "conciliatory spirit"?

Why don't these Massachusetts gentlemen look into the matter that is at issue between the anthracite miners and operators—the check-off—and decide which side to back? But casual investigation will show them that strikes alone cause the shortages of hard coal they decry and that the United Mine Workers are demanding that the operators force the collection of funds to line its war chest so it may strike longer and harder. Then if the Massachusetts' consumers conclude that enough is enough, that the union has attained a satisfactory growth, let them cease pointless generalities and get

down to the brass tacks of seeing it through. Let them say to the world, "We will get along this winter with what hard coal we have and the abundance of soft coal we can get, in order that another year we will not need fear a strike and shortage; that we may, those who prefer the luxury, have an uninterrupted supply."

What sort of sports have we in Massachusetts, who would pass the buck to Washington, call a special session of Congress, ask the President to do something? Do what? This is no quarrel between the capital and the labor of the anthracite fields, no dispute regarding the rights of abused workers. As is pointed out by the anthracite operators, it is a quarrel among the men. A militant union is demanding that the operators collect dues and assessments from all the workers, because it cannot, or is too lazy to collect them. No one for a moment supposes that Congress could if it would impose such a situation on the industry. If New England and other hard-coal consumers want peace in this industry, let them make their voices heard in defence of good Americanism.

Preparing the Public's Mind

IN THIS day when we depend on a few headlines in the morning paper to keep us abreast of the times, the news that gets attention is that which stirs. You may call it "inflammatory" if you will, but if it is to get across to the American people it must have some "pep." Steady pounding away on everyday truths plainly told will in the end harvest a crop of understanding, but for the action of today and this week and even this month or year, there must be headline value to the story. Deprecate it as you may, that is the condition of a sensation-satiated popular mind.

The Coal Commission has called attention to the fact that "some of the material from both the operators and the United Mine Workers presented to it is calculated even if not intended to inflame the public mind for or against one of the parties," and considers these charges and counter charges "most unfortunate at this period of [the anthracite] negotiations." The American people are not so callous that a year after the event the mention of Herrin does not make them "see red." If the recital of that and other outrages that characterized the strike of 1922 serves to remind America that a majority of the coal-mine labor is dominated by a force that permits such practices, the operators will doubtless be willing to plead guilty to the charge of thus inflaming the public mind. What is to be gained by shutting eyes to the unpleasant, unlawful features of such industrial strife? Can it be that forgetfulness will purge them from the ranks and encourage the officers of the union to prevent their recurrence?

In its anthracite report of July 9, the Coal Commission had itself some headline news. It was not the finding that the operators realized so much profit or the mine workers certain annual earnings, not that the

commission had urged coal be held henceforth as a public utility. Rather it was that in the event of an emergency in hard-coal supply, whatever the cause, the President of the United States be authorized to take over the mines, operate them, fix profits and prices for the operator and wages and working conditions for the miner. Again it may be said with a slight change that the American people are not so callous that a year after the event the mention of the 1922 hard-coal strike does not make them "see red." They rose to the occasion and applauded the headlines that followed the publication of the report, "Coal Commission Recommends President Take Over Coal Mines." There was some "pep" in that news.

If the situation is so serious that nothing short of the arbitrary hand of the government may serve to give the people necessary fuel, then indeed we are in desperate straits. It must not be assumed that the Coal Commission came lightly to a decision so unusual, so drastic. The evidence before them must have been compelling and the necessity great to have provoked such an indictment of the ability of this great industry to function continuously.

Even the most casual observer must know of the similar threat by President Roosevelt in 1902. Then the mine workers were on strike and the operators steadfastly refused the peaceful mediation of the President. He was forced to threaten the use of Federal troops and the imposition of his power before he could compel the operators to concede arbitration of their differences with the workers.

Even the most casual observer of the situation today, and in 1922, must know that the positions are now reversed. The operators learned a lesson in 1902, the union has its lesson yet to learn. It is the union now that is militant, domineering, arbitrary and recalcitrant. If the President this year finds it necessary to exert emergency power over the anthracite industry it will be because the United Mine Workers will concede nothing of their power. Perhaps this is why Mr. Gompers objects so strenuously to the Commission's proposal. It will not be because of any position so far assumed by the operators. To argue otherwise is to impugn their good faith in reiterated offers to arbitrate any and all differences.

With sublime patience and forbearance the Coal Commission last month counseled "that each side forget past differences and grievances" and hoped "that a constructive view will be taken, not controversial in its character, so as to assure a continuous output from the anthracite mines." This sound advice from a commission not set up to determine the merits of this immediate controversy has not prevented a deadlock in the hard-coal negotiations. The matter is fast drifting into a position where President Coolidge is being expected to "inquire into the reasons for failure to agree," as recommended in the supplemental report on labor relations in the anthracite industry, just released by the Coal Commission. The Commission's recommendation has prepared the public to expect him to act.

PAUL WOOTON, Washington correspondent of *Coal Age*, whose stories on the coal situation as it is viewed in the Nation's Capital are conceded to be the most timely and interesting coming out of that center, is now in Europe. On his return *Coal Age* will have a series of timely stories of his impressions of the coal situation abroad.

Preparing for the Fall Rush

THOUGH there is yet uncertainty about the supply of anthracite after Sept. 1, and every possible pound is being mined and shipped, there is no doubt but that the country is preparing itself with ample reserves of soft coal in anticipation of a heavy fall demand with transportation facilities curtailed. There will be no suspension of mining in the soft coal regions after Sept. 1, induced by labor trouble. Since April 1, the country has been running a race in the storage of coal. If the consumer wins, the suspensions of bituminous coal mining will result from lack of market, otherwise the cause will be car shortage.

Whatever be the outcome, there can be no regret over not having tried. Since the beginning of the coal year consumers have added to their stocks some 10,000,000 tons of soft coal and are even yet putting it away at bargain prices. With the total now somewhere near 50,000,000 tons, the safety line may be said to have been passed. Apparently nothing but a prolonged shutdown in the anthracite region can produce a demand for soft coal but what the railroads can take care of without serious car shortage in the coal fields.

Business interests discounted the slump in July. The spring rate of industrial activity was too much for the hot period. There is already evidence of an August pickup and having continued so far with a demand for soft coal approaching 11,000,000 tons per week, there is reason to anticipate that it will hold to this level until other freight crowds it off the rails in the fall rush. As to the course of the market after that the trade is uncertain.

The Vagaries of Compensation

WORKMEN'S COMPENSATION is provided in every coal mining state except only Arkansas and Missouri. If payments for compensation do not actually add to the cost of coal, the amounts so paid, which range from 3c. to 10c. per ton, are at least clearly recognized and definitely known to the operators. The operators and workers have accepted as just the principle that the one group should be charged with major responsibility for injuries suffered by the other group. The only question that now arises, other than the determination of the proper rate, concerns the matter of preventing its serious abuse. It is not an uncommon experience for an operator to find in his employ a worker who is receiving payment for complete disability for an accident at some other property.

A study of workmen's compensation laws has recently been made by the National Industrial Conference Board, an abstract of which is published elsewhere in this issue of *Coal Age*. The striking facts brought out by this report concern the extremely variable results of the operation of these laws in the different states. As pointed out in the Board's summary, the compensation is first of all a medical question, because a doctor's examination is the first step in establishing compensation.

It might be added to what the Board says that local decisions come down so fast as to confound the observer. Every case seems to present peculiar aspects and the compensation boards in each state are busy establishing precedents and interpreting former decisions. The employer hardly knows where he stands and is quite naturally on his guard to hold the awards to a rightful minimum.

Navajo No. 5, Gallup American Coal Co.

Auxiliary Shaft Both Hoists and Lowers Coal at Two-Seam Navajo No. 5 Mine in New Mexico*

Cars from Upper Seam Lowered in Auxiliary Shaft to Lower Bed, from Which Coal Is Hoisted up Main Shaft by Skips—Chain Car Feeder Handles Loads at the Main Bottom

By H. B. COOLEY†

General Superintendent, Allen & Garcia Co., Chicago, Ill.

IN MOST respects the screening and preparation equipment at Navajo No. 5 mine of the Gallup American Coal Co., near Gallup, N. M., is similar to that of other bituminous coal tipples. Among the unique, or at least unusual, features to be mentioned are what might be called the dual screening arrangement. Navajo No. 5 is operated primarily to insure a supply of coal for metal mines, mills and smelters in Arizona and New Mexico. Coal for their needs requires only a bar screen for its sizing.

However, there is a market for good domestic coal, and this trade, being naturally more exacting, makes shaker-screen preparations necessary. For this reason the tippie is provided with what is practically a dual

screening arrangement—that is, bar-screen sizing, making 1-in. lump and slack, and shaker-screen sizing making lump, egg, nut and slack.

A second somewhat unusual feature is the use of rubber-covered belt conveyors for picking tables and loading booms. It is not claimed that this is the first adaptation of belt conveyors to this service, but the more common type of picking table and loading boom is the apron conveyor. The conveyors used throughout the job are belts, the expression “carry it on rubber” being strictly true in this installation. Six-ply rubber belting with $\frac{3}{8}$ -in. rubber cover is carried on pressed-steel idlers, their spirally grooved roller bearings being lubricated with grease in a manner insuring a positive feed at all times. The first cost of such an installation is less than that of an apron conveyor, and the number of wearing parts is reduced to a minimum. No figures

*This is the second part of Mr. Cooley's article on the Navajo No. 5 mine. The third part, covering power plant, water supply, safety work and company buildings will appear soon. The first part appeared in *Coal Age*, Aug. 2, 1923.

FIG. 1

Rubber Belts for Loading Booms

These loading booms serve also as picking tables and are 5 ft. wide. They travel at a speed of 80 ft. per minute. The front boom is loading egg and the rear one lump coal. A saving in first cost is effected by the use of the rubber belt. The belt idlers run on roller bearings. All the conveyors on the Navajo tippie embody rubber belts in their construction.

are yet obtainable on the length of time the belts will last, but it is safe to say they will serve for many years. Fig. 1 shows the belts carrying coal.

The third unusual feature is the arrangement for loading four grades of coal on three tracks. Though 2x1-in. stove coal is being made, the slack is carried to either one of two 150-ton storage bins located on the switch below the tippie and loaded out on the same track as is used for the loading of "stove," or nut, coal. These bins also serve as auxiliary storage pockets for boiler coal during "shutdown" periods. This stock is supplemented by the coal in a 200-ton coal bunker located in the boiler room.

The provision for utilizing burnable refuse for the picking tables is noteworthy. Bone coal occasionally is found in the Gallup seams. The heat value of this bone is around 10,500 B.t.u. and when crushed it can be readily burned on properly designed chain-grate stokers. This material is removed from the picking tables by hand and carried to a storage bin by an 18-in. belt conveyor.

To avoid installing an independent elevator for the hoisting of this bone coal to the crusher the main hoisting skips are utilized for this purpose. At convenient intervals this material is fed into the skips and dumped through a bypass gate to the crusher, whence it passes on to the boiler house over the same belt conveyors that carry the other fuel supply. This inferior coal, of course, is handled only after hoisting hours or at times during the day when the hoist otherwise would be idle.

RETARDING CONVEYOR FEEDS BOX-CAR LOADER

In this territory most of the lump coal is loaded in box cars. For this operation a drag-conveyor box-car loader with an extension end is provided. This machine is fed by a short retarding conveyor running at right angles to the track, this belt in turn being fed from the discharge end of the lump loading boom.

This short retarding conveyor is what might be called by some operators a "needless refinement." But the Gallup American Coal Co. considers any machine a valuable asset which helps to put the company's lump coal on the market clean and free from undersize. It is not unusual at other plants to see perfectly sized lump coal from a shaker screen badly shattered in passing from the screen to its resting place in a box car.

The usual facilities are provided for the furnishing of local, or wagon, coal, provision also having been made for crushing for industrial use any part of the mine output which, being destined to that use, needs to be reduced in size. The accompanying flow sheet (Fig. 2) and the general design plans (Figs. 3, 4 and 5) illustrate the preparation plant and general arrangement. Fig. 8 shows the headframe.

The entire structure is substantially built and fireproof throughout. Steel sash are freely used and a large skylight affords overhead illumination for the picking shed. The interior

walks and floors are of reinforced concrete and all outside walks and stairways are of "subway grating." This material is light and substantial and does not become coated with snow and ice during the winter months. It is rather expensive for large areas, but its use entirely eliminates fire hazard and all maintenance cost except for an occasional painting.

AUXILIARY TIPPIE HAS SOLID-CAR SELF DUMPER

The auxiliary tippie is arranged for cage hoisting. These cages are somewhat unusual in that they are designed to handle cars without end gates, this type of car generally being used with a rotary-dump installation, such as that at the bottom of the main-hoist shaft. The action of this cage can be understood by referring to Figs. 7 and 9. The tipping guides and mechanism are arranged to revolve the car through 135 deg., in which position the car is completely emptied.

A flygate, placed directly at the dumping point and operated either manually or by compressed air, enables the man who directs the dumping to divert the coal to

a set of bar screens and the rock to a 50-ton storage bin. This rock bin is adjacent to the shaft and directly over a larry track leading to the rock dump. By referring to Fig. 6 it will be noticed that there are three coal-loading tracks under the tippie.

It never was intended that this auxiliary tippie would be a continuous operating plant for coal preparation; therefore the bar-

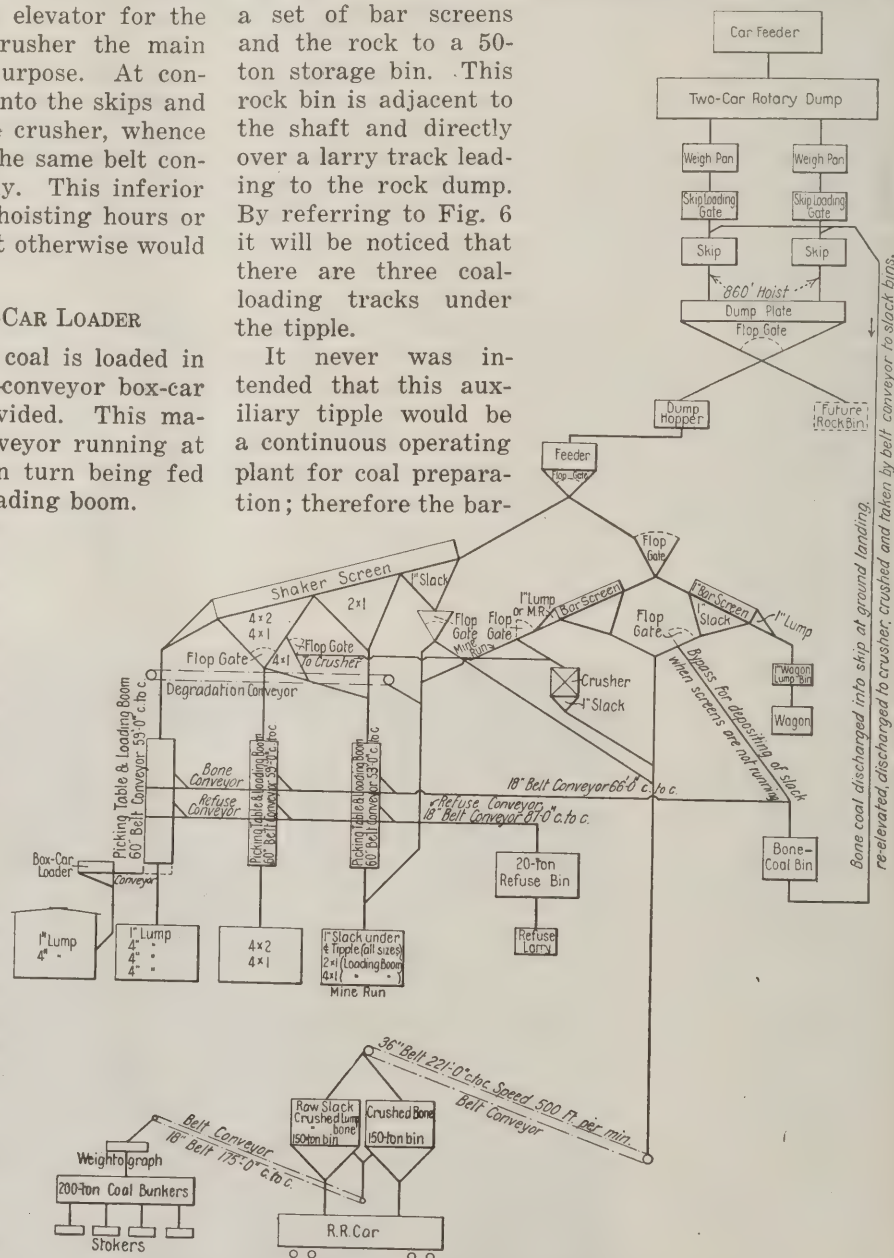

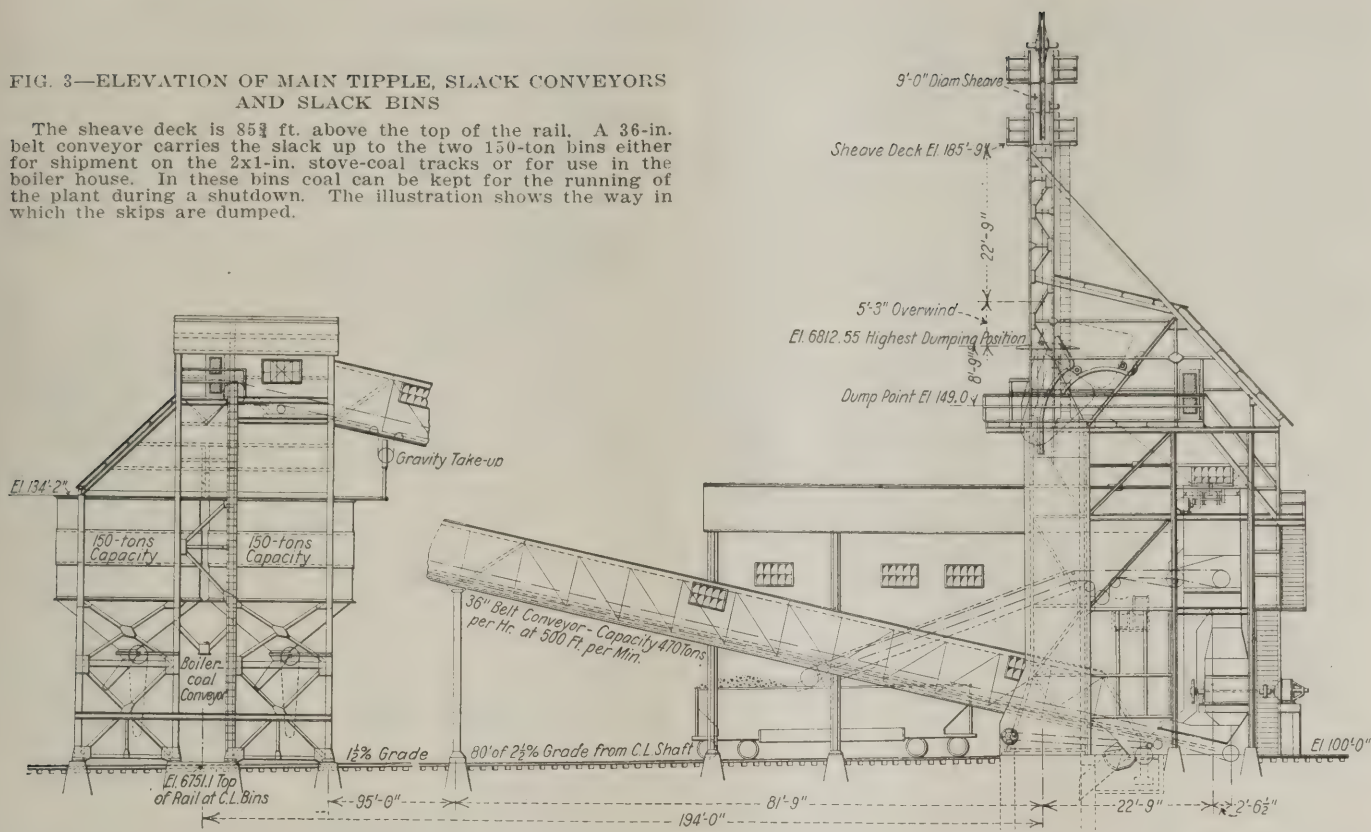

FIG. 2—FLOW SHEET FROM MINE TO RAILROAD CAR

Coal can go either (1) to the double-deck, double-leaf, pendulum-hung shaker screen with perforations and gate arrangements to supply 4x2-in. or 4x1-in., 2x1-in. coal and 1-in. slack or (2) to a 1-in. bar screen which when veiled gives mine run.

FIG. 3—ELEVATION OF MAIN TIPPLE, SLACK CONVEYORS
AND SLACK BINS

The sheave deck is 85½ ft. above the top of the rail. A 36-in. belt conveyor carries the slack up to the two 150-ton bins either for shipment on the 2x1-in. stove-coal tracks or for use in the boiler house. In these bins coal can be kept for the running of the plant during a shutdown. The illustration shows the way in which the skips are dumped.

screen sizing was considered ample. The main requirements of this headframe were that it carry the cage, sheaves and rock bin. Screening was not proposed. In laying out a design for these requirements, however, it developed that by slight modifications in the design of the engine brace this part of the structure could be used to carry a barscreen installation with practically no increase in cost except for the bar screen itself.

This headframe is arranged with the sheave wheels placed side by side, an arrangement ordinarily not as economical from the standpoint of design as where the sheaves are placed one over the other and the hoist located at the end instead of at the side of the shaft. That plan was impossible in this case for a reason that is not common in most coal fields.

The workable seams of coal are reached by these

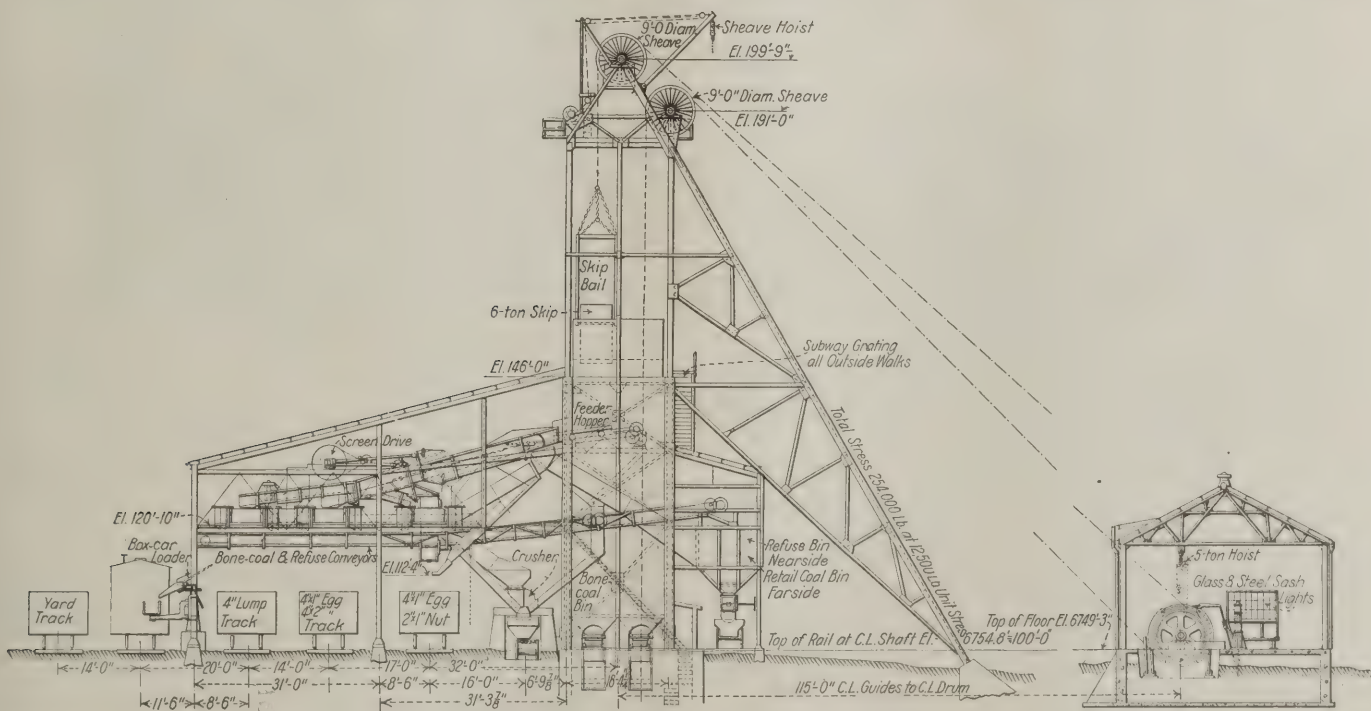

FIG. 4—ELEVATION OF MAIN TIPPLE AND HOIST HOUSE SHOWING SKIP AND TRACKS

The hoist rope is 1½ in. 6x19 plowsteel rope. The maximum load is 35,180 lb., and the breaking strength is 188,000 lb. The frictional strain is 1,330 lb. and the acceleration strain 2,830 lb. The bone coal is fed from the bone-coal bin into the skip and

raised to such a level that it can be dumped. A flap gate admits this coal to the crusher, where it falls on a conveyor and is taken to the boilers for feed. The boiler furnace is designed to burn efficiently coal containing 45 per cent ash.

shafts but the development of the upper seam would not be warranted if a separate plant were required for its operation. It is planned at Navajo No. 5 to mine the upper seam in conjunction with the lower, caging the cars at the auxiliary shaft and dropping them to the lower seam. From this point the coal is handled with that from the lower seam through the main shaft and the main preparation plant.

This plan of operation requires the installation at the auxiliary shaft of a hoist capable of being adjusted for hoisting from different levels. For this a double-drum hoist with one drum loose is installed. This explains why the hoist is not placed at the end of the shaft.

The hoist has two 7-ft. diameter straight cylindrical drums, each drum being equipped with parallel-motion post brakes. The loose drum is engaged to the shaft by means of a friction clutch operated by a hydraulic thrust cylinder with control levers placed on the platform of the operative. The hoist is of the second-motion type and driven by a 500-hp. 2,300-volt induction motor through a single set of herringbone gears.

CAGES CAN BE HOISTED UP SHAFT UNBALANCED

Though the normal operation of the hoist is in balance, the motor has sufficient torque capacity for hoisting the load unbalanced. The motor is controlled by air brake reversing and secondary switches which provide current-limit acceleration and overload protection.

The hoist equipment is provided with safety devices to prevent overspeed at any point, over-travel and abuse of the hoisting equipment when hoisting either coal, rock or men. Fig. 10 shows the duty cycle on which the rating of the motor is based for both balanced and

unbalanced hoisting. Fig. 9 shows the general arrangement, and Fig. 11 shows the hoist and its control platform. Most of the loading equipment for skip-hoisting mines has been designed for handling ore, where breakage,

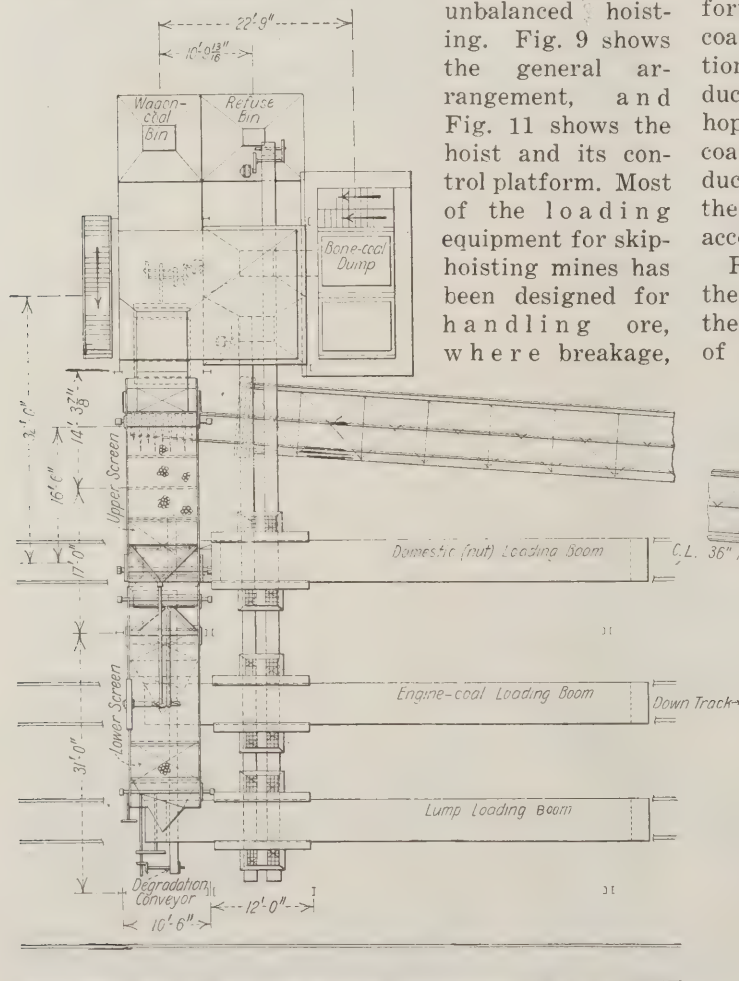

FIG. 6—SIDE ELEVATION OF MATERIAL HOIST

The tippLe of the material hoist has only a bar screen and makes lump, egg and slack. The rope is 1 1/2-in. plow steel, its maximum hoisting load is 25,800 lb., its breaking strength is 144,000 lb., its frictional strain 750 lb. and acceleration strain 1,050 lb.

fortunately, need not be considered. Degradation of coal being something to be avoided, a coal-loading station should be so arranged that breakage will be reduced to a minimum. With this in view, no storage hopper is provided, and the path along which the coal flows between the loaded car and the skips is reduced to a minimum. The arrangement as shown on the accompanying illustration, Fig. 13, is intended to accomplish this purpose.

Referring to that picture and the flow-sheet, Fig. 2, the mechanical arrangement and method of handling the coal can be understood. It is as follows: Trips of varying length are brought to the shaft bottom by

FIG. 5—PLAN OF MAIN TIPPLe, SLACK BINS AND HOIST HOUSE

A yard track, not shown, passes parallel to the box-car track at 14-ft. centers. It will be noted that the domestic coal or nut-loading track passes under the slack storage tanks, provision for loading being made at that point. A coal conveyor goes from the center line of the bin structure to the boiler room. The distance from the center bin of the guides in the shaft to the center line between the drums is 115 ft. It may be noted that the engine-coal and lump-coal tracks are covered by a single span of the tippLe structure giving the loaders plenty of room for passing between cars, the tracks being set at 14-ft. centers. The domestic-coal and engine-coal tracks are at 17-ft. centers, the posts of the tippLe intervening.

haulage locomotives and are there coupled to such loads as are standing on the load storage track. The movement of the trip from this point is controlled by a motor-driven chain "car-feeder" which engages a lug on the bottom of the car. The entire trip is moved ahead two car lengths at a time, the power being furnished by a 35-hp. motor. Deceleration and stopping are controlled by a powerful foot-operated brake acting on the head shaft of the feeder drive.

The chain and lugs on this feeder are unusually rugged and are designed to handle a trip of 40 cars, moving them through a distance of 21 ft. with a cycle as follows: Acceleration, 4 seconds; running-time, 14 seconds at a speed of 75 ft. per minute; deceleration, 2 seconds; rest period for dumping of cars, $8\frac{1}{2}$ seconds. The skip is arranged for carrying the coal from three cars, hence the hoist cycle is $3\frac{1}{2}$ times as long as the dump cycle, or 43 seconds.

The use of this power-driven feeder has many advantages over a gravity operation, the most important being that the car motion is under positive control at all times and that the cars can be positively "spotted" in correct position for dumping.

A two-car, pneumatically operated, rotary dump is used for emptying the solid-end cars. It is essentially a rotating cage with the center of rotation coinciding

FIG. 8—MAIN HOIST WITH CONVEYOR TO SLACK BINS

It will be noted that three sides of the concrete shaft curbing are carried to the dumping point, thus insuring protection to the steelwork from the shaft gases and eliminating the vibration of the hoist.

power house through a 2½-in. line which was carried down the shaft during the sinking operation and incased in the concrete shaft lining.

The coal from each car in the rotary dump is emptied

FIG. 7—SOLID-END CAR IN OVERTURNING CAGE

As the main tippie has a rotary dump the cars are made for that method of discharge. No rotary dump is provided at the material shaft and cages are used instead of skips. It has been found necessary in such cases to provide a cage that will dump the car through 135 deg., assuming, of course, that decaging with its loss of time and expense of labor is to be avoided.

with the center of the car hitching. The cars are dumped without uncoupling, there being sufficient play in the three-link hitching to permit of 135-deg. rotation. The crew at the bottom now consists of but two men, one of them the weighman. At present the trip rider goes around to the back of the shaft and cuts off the number of cars wanted for each empty trip. The actual time required for dumping two cars is less than seven seconds, and approximately 6 ft. of air at 90 lb. pressure is required for each dump. Compressed air for this purpose is furnished by the compressors in the

FIG. 9—OVERTURNING CAGE IN DUMPING POSITION

It was found necessary to provide a spill gate which follows the cage and projects under it so that all spill is caught and delivered onto the chute. It also was found that coal frequently spilled from the cage platform and the latest design of this spill gate embodies a pantograph extension which catches all spill from the cage platform as well. The spill gate is operated by a lever on the tipple which is engaged by angle guides on the bale of the cage.

FIG. 10—DUTY CYCLE OF AUXILIARY-SHAFT HOIST

Arranged for both balanced and unbalanced hoisting. The total lift is 821 ft., the load in the car 6,000 lb.; the weight of the car, 2,680 lb.; the weight of the cage, 12,500 lb.; the size of rope, 1 3/8 in.; the WR² of the motor, 9,280 lb. ft.²; the motor speed, 440 r.p.m., and the rope speed, 1,100 ft. per minute.

into two independent weigh hoppers placed side by side. After the first two cars are weighed two more cars are dumped and the difference in weight is taken as the weight of the second cars. This operation is again repeated and the contents of the weigh pan then passes to the skip. The weigh beams on the scale are of the triple-beam type, and the poise on each beam is used to "balance the scale" after each weighing. A weightograph is connected to the end of the scale beam, and the weighman is thus given the individual car weights without any process of subtraction or possible chance of error.

Between the weigh pan and the skips are two short chutes arranged with undercut "safety gates" to prevent the coal from being spilled into the sump. These gates are opened by the descending skip and closed by gravity as the skip is hoisted. The relative position

of the bottom-loading apparatus is shown in the perspective view, Fig. 13.

The skips used are of the overturning type and have a normal capacity of six tons. They weigh 13,300 lb. each, making a ratio of weight of coal to dead weight lifted of 1 to 1.1.

An interesting comparison of weight ratios might be mentioned: In a cage-hoisting mine recently investigated the coal hoisted per trip was 4,500 lb., the car weighed 1,800 lb. and the cage (all steel) weighed 10,500 lb., making a ratio of weight of coal lifted to dead weight lifted of 1 to 2.7. Consequently the skip has a marked advantage in this respect.

FIG. 12—DUTY CYCLE OF HOIST AT MAIN SHAFT

The same maximum rope speed of 1,100 ft. per minute, or 12 1/2 miles per hour, is provided as in the auxiliary hoisting shaft. The total lift is 860 ft.; the load in the skip is 15,000 lb.; the weight of the skip is 13,300 lb.; the diameter of the rope is 1 3/8 in., the WR² of the drum is 700,000 lb. ft.² and that of the motor, which has a speed of 66 r.p.m., is 300,000 lb. ft.²

It must be admitted, of course, that the total load lifted is larger, as three times as much coal is raised per hoist, and the hoist must be of heavier construction, although the power consumption of course, is notably less for the skip-hoisting operation.

The hoist for handling these skips is of first-motion

FIG. 11

Auxiliary Shaft Hoist

This hoist has two 7-ft. straight cylindrical drums, one of which is a loose drum. In consequence of this latter provision coal, men and material can be hoisted from more than one level. The loose drum is engaged to the shaft by means of a friction clutch operated by a hydraulic thrust cylinder with control levers placed on the operative's platform. The floor around the hoist is all on the drum-pit level, a convenient arrangement for access to the brake engines and control mechanism.

FIG. 13—DETAILS OF EQUIPMENT IN BOTTOM OF SHAFT

(1) Two-car rotary car dump which discharges cars without uncoupling. (2) Trip feeder which moves the trip two car lengths for each operation. (3) Two weigh hoppers, each of which holds and weighs a skip load or three cars. (4) Two skip-loading hoppers which prevent spillage into the sump and (5) Two skips of the overturning type.

type, the motor being coupled directly to the drum shaft. The drum is of cylindro-conical shape with a small diameter of 7 ft. and a large diameter of 10 ft. 6 in. with groove arrangement for affording maximum hoisting efficiency.

The drum is equipped with a parallel-motion post brake 9-ft. in diameter with 11-in. face set by gravity and released by a hydraulic thrust cylinder actuated by oil under pressure. The drum also is equipped with two rope-adjusting drums placed outside the spiders, but in such a position that the ropes lead on from the

rope spouts on the main drum. These take-up drums provide a means whereby the ropes may be adjusted and extra rope stored so that the section of the rope close to the skip shackles where the greatest rope wear occurs can be cut off from time to time, thereby increasing the life of the rope materially.

The drum and armature shaft is supported on three bearings with a flanged coupling between the motor armature and the hoist drum outside of the hoist-drum

FIG. 14—LAYOUT OF MINE BOTTOM

The main-line locomotives enter by the main entries north and south delivering cars on load track A. After dumping they pass by gravity in continuous trip to empty track C. It is purposed to have a locomotive specially stationed at the bottom to deliver empty cars from track C to the main-line locomotives at the point where they have released their loaded trips.

bearing. Proper thrust bearings are provided to prevent lateral movement of the drum.

The hoist drum is driven by a 1,100-hp. direct-current motor, operated in conjunction with a flywheel motor-generator set and slip regulator and controlled by a modification of the Ward-Leonard system. This arrangement is provided so that the power input to the

FIG. 15

Main Hoist

A cylindro-conical drum is provided. The motor is direct-connected to the drum shaft. Devices are installed to prevent overspeeding, over-travel, and starting in the wrong direction. Automatic acceleration and automatic retardation are provided. Should the operator fail to slow down his hoist at the proper time the hoist attends to that duty automatically. The drum has two rope-adjusting drums placed outside the spiders. These take-up drums provide for the adjustment of the ropes and for extra rope whenever the ends receive their periodical cutting off.

hoist can be regulated to prevent excessive peaks being imposed upon the power source. With proper regulation this input can, when hoisting in accordance with the calculated cycle, be maintained within 5 per cent on either side of the mean. Fig. 12 shows the duty curves as calculated for this hoist and on which the size of electrical equipment has been based.

The hoist operation is fully protected by devices to prevent overspeed, over-travel, starting up in the wrong direction, and to provide automatic acceleration and also automatic retardation in case the operator fails to slow down the hoist by manually operating his controller at the proper time. Fig. 15 shows the hoist arrangement, and Fig. 16 shows the flywheel set and control apparatus.

Referring to the plan of the workings adjacent to the shafts, Fig. 14, it will be noted that the main haulageways are north and south, and the main shaft is located some 500 ft. to the right of these main entries. Coal is thus brought from either side of the mine without interference with haulage from the other side. The grades were such that much rock work was necessary in making room for empty cars and this work was reduced to a minimum by making a single run-

around for motors going in for empty cars.

Slopes have been driven from the main haulageway to the roadways in the old mines, and the coal from the old workings is gradually being diverted to the shaft operation. Grades up to 8 per cent are met in getting coal from these old workings but all are in favor of the loads. Rope hoists with electric drives have been in use for many years, whereas the advent of haulage motors is recent. Three 6-ton combination storage-battery and trolley motors are now being tested for gathering, and two 10-ton haulage motors are in service for the longer hauls. The new workings have grades up to 3 per cent but most of them are in favor of the loads.

The use of mining machines for undercutting this coal was abandoned several years ago after a thorough trial. The coal cut readily, but the difficulty was that the cutter frequently stuck, due to the squeezing of the coal. The entire seam appears to be in a strain, and when the cutter bar enters there is sufficient expansion to wedge the chain. The coal is defined locally as "explosive" because of this action, for when the face is attacked with a pick the coal immediately breaks down, making it comparatively easy to mine it by hand.

FIG. 16

Motor - Generator Flywheel Set

The flywheel, which is protected and disguised by the steel cover, is 10 ft. in diameter and 22½ tons in weight. It runs at 700 r.p.m. and by reason of its great weight and high speed has sufficient energy to equalize the power input to the hoisting equipment.

FIG. 17—SOLID-END MINE CAR

Side boards and ends are of 1½-in. and bottom of 3-in. oak. The main carrying member is a 8x8-in. Z-bar. The car has solid ends and all parts are thoroughly connected to the body irons.

The miners drill and load their own holes, but all shotfiring is done after the men leave the mine. Solid-end mine cars are used, the general design being shown in Fig. 17. Attention is called to the thorough manner in which the wood parts are held together. The entire car is really a steel skeleton with wood lining—in fact all the body irons could be assembled without using any of the wood parts for connecting them. Lincoln trucks are used with self-aligning roller bearings. The capacity of the car level full is 72 cu.ft.; the car bodies weigh 1,790 lb. and the trucks 890 lb.

Important Position of Coal In Super-Power Plan

Demand for Power Increasing — Significance and Effects of Recent Advancement—Elimination of Waste—Coal Fields Main Source of Power

BY EDGAR J. GEALY

Electrical Engineer; Associate Editor, *Coal Age*

VIEWING the steady march of progress one need not be a far-reaching expert or dreamy visionary to believe that recently proposed super-power systems are already under way. Increasing demand for greater electrical energy has necessitated the installation of greater power plants, larger distributing systems and made necessary increased economy in the generation and transmission of power.

One of the most far-reaching conceptions of modern times is shown in the map prepared by Frank G. Baum, hydro-electric engineer, which depicts a super-power system projected to cover practically all of the United States and Canada. The plan would make available to the entire nation and Canada the combined resources of water power and coal, and at the same time provide the maximum amount of power at the lowest cost, distribute it to the largest number of people, and most effectively conserve our resources.

Such a system of development is both practical and highly desirable. A nation's standing in the scale of modern civilization may be fairly measured by the extent to which it is utilizing its natural sources of power. Increased use of mechanical and electrical power releases human energy for higher application.

Electrical development has now become a direct criterion of the progress of our nation. Fully one-half the world's natural power supply is converted into electrical form before it is finally utilized. This is because electricity frequently is the cheapest and most convenient form in which to transmit and utilize power.

Recent developments have made it possible to deliver

power over distances of 400 or even 600 miles with high efficiency. Transmission lines are successfully operating on 220,000 volts. Transmission voltage like this has many advantages that are highly desirable for long-distance transmission of power. Doubling the voltage of a transmission line makes possible the transmission of four times as much power with about the same efficiency and voltage drop. It also involves the expenditure of far less capital than that required for two parallel power lines that could carry only half the amount of energy at 110,000 volts.

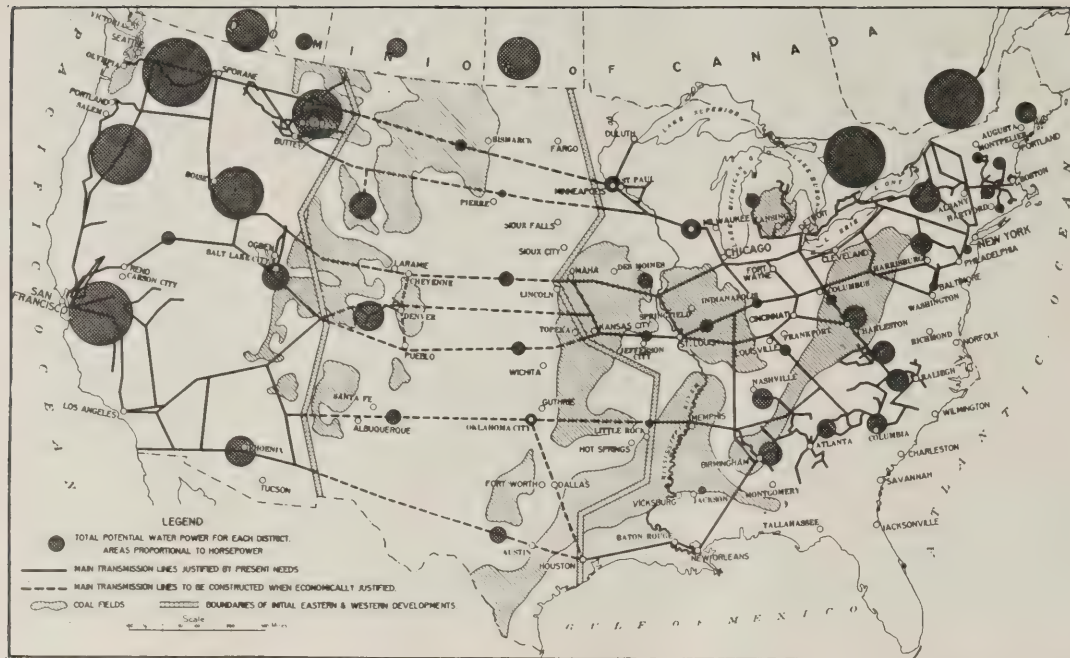

A saving of 158,000,000 tons of coal annually is possible by utilization of the power now going to waste in the Niagara and St. Lawrence rivers, it is asserted by William S. Murray, chairman of the Super-Power Survey Commission of the U. S. Geological Survey.

What does the super-power system mean to the coal industry? For years it has been the dream of engineers that coal would be converted into energy at the point of production and transmitted to users in the form of electric power, and possibly some in the form of gas. Until recently it appeared that the saving in transmitting current instead of transporting coal over a hundred to two hundred miles was not sufficient to warrant the heavy initial investment required to set up power plants and transmission lines, nor was the extent of the territory served large enough to make the project practical. But with the extension of the power-carrying facilities to a 600-mile limit new possibilities are immediately opened up.

Under the present plan large amounts of coal are transported long distances, being handled and rehandled, lost and broken, entailing great expense and waste. On arriving at its place of consumption much of it is used in the generation of electrical energy; frequently it is burned in uneconomic boiler plants by old and inefficient methods, thus resulting in additional losses and waste. This uneconomic conversion of latent coal energy into electrical energy goes on and until some plan of unification is devised and effected will continue to go on wastefully. At most of these plants the loss is on such a relatively small unit quantity that no one seems to realize the gigantic aggregate waste.

Conservation of our national resources is imperative; waste in industry must be reduced to as low a value as possible. No doubt when today's resources of energy are depleted posterity will have solved its problems; progress will be made no matter how great the task. But, nevertheless, it behooves us—and no doubt it is the problem of our generation—to utilize our power resources to the greatest advantage and with the highest economies, because by so doing we not alone conserve our resources but release our present wasted energies for higher development and use.

The super-power plan system cannot fully develop without the assistance of our coal fields. It is asserted that the full development of all our water-power sites for the manufacture of energy would replace only about half that produced through the consumption of coal today. Few realize the compact latent energy in coal, as revealed in comparing the quantities of water and coal necessary to generate a given amount of electrical energy. At the hydro-electric plant it requires the fall of about 26,000 lb. of water per hour from a height of 100 ft. to produce a horse-power-hour of electrical energy; with coal it requires the burning of 1.5 lb. per hour to produce an equal quantity of electrical energy.

Suggested Super-Power System

The plan involves the development of unit districts which would later be interconnected and expanded to stretch across the continent. Water-power sites would generate large volumes of energy which would be combined with generating plants located at the mines.

In other words a 3-in. cube of coal—which could readily be held in the palm of one's hand—can be burned to accomplish as much work as a horse can do in an hour.

A difficulty which has long stood in the way of conversion of coal into electricity at the mines is the question of railroad freight. Power at the mine is of no value; it must be carried to the factory where it is to be used. At present this work of transporting power is done by the railroads by freight cars. This is an important source of revenue to the railroads. Yet, with our railroad equipment greatly overtaxed, enormous waste and loss of coal in transportation, high labor charges in handling coal, increased facilities for the economic conversion of coal into electrical energy and improved methods of electrical transmission it appears that the urgency of the problem demands serious con-

sideration. It has been pointed out that transmission lines could be built on the railroad right-of-way, where leases for transmission lines probably would make up in large part for the loss in revenue from coal. Electrification of the railroads would be rendered more simple, thus making increased economies possible. And the normal increase of other items of freight would make up for the decrease in coal shipments.

The extensive program of tying into one great system all the electric power systems of the country is timely, as it is becoming increasingly more necessary. As the river, railroad and highway systems are the transportation arteries of the country so should the power plants be linked together to be the muscles of power for the further development and progress of the farms, factories, and mines.

Pennsylvania State College Provides Extension Classes in Coal Mining

IN ORDER to provide men in and around the coal mines of Pennsylvania with facilities for studying mining the State Department of Public Instruction, the State Department of Mines and the School of Mines of the Pennsylvania State College undertake to assist groups of persons in the various communities of the coal-mining regions in obtaining that kind of instruction. Classes may be promoted by the persons who desire the instruction. How they should proceed to obtain it is outlined as follows:

When twenty or more men in a mining town wish to form a class for instruction in mining subjects they should request the school board of the school district in which they reside to conduct an evening class in mining for them, and notify the State Department of Public Instruction, Harrisburg, Pa., of their request.

If the school board, after due consideration, finds that an evening class in mining is desirable for the community, it will open such a class in one of the local schoolhouses or other convenient place. This class will be operated by the school district, and no tuition will be charged residents of the district.

If an evening class in mining is desirable, the school board may receive assistance in organizing such a class from the State Department of Public Instruction. Ar-

rangements are also possible whereby the school board and the State Department of Public Instruction will jointly bear the expense of the instruction. The state law provides that the State Department of Public Instruction may reimburse the school district to the extent of two-thirds of the salary of a teacher of an approved mining class.

The teacher training department of the Pennsylvania State College is prepared to train and to recommend to the State Department of Public Instruction for certification competent teachers for evening classes in mining subjects. After the teacher has been appointed, lesson material in printed form will be furnished at the cost of printing by the School of Mines of the Pennsylvania State College.

The teacher-training officers connected with the School of Mines of the Pennsylvania State College will visit, for the purpose of teacher training, classes which are organized in accordance with the above plan. Officers of the Pennsylvania Department of Public Instruction will inspect and supervise the said classes for the purpose of approval and reimbursement on the part of the state.

Classes usually will begin in October or November and continue throughout the winter. They will be held in the evenings once or twice a week or at such times as may be locally agreed upon. Instruction should extend for a period of not less than sixty hours per year.

Group Insurance: What It Is and Its Advantages To Employer and Employee

Save in Two States No Medical or Physical Examination
Is Necessary—Many Unable to Obtain Individual Insurance
Get It Through Group Plan—Tends to Increase Production

BY R. W. SPARKS

OVER 2,500 years ago Aesop told a tale of how four oxen in a field repeatedly protected themselves from the attack of a lion who frequented their pasture by standing with their four tails together so that no matter from what direction the lion attacked he was met by a pair of horns. One day the oxen fell to quarreling among themselves and their defense was immediately destroyed, whereupon the lion killed and ate them one at a time.

Today we are still learning that in the long run the best course is unity and co-operation. Efforts are being made every day to bring about a closer tie between employer and employee, for therein lies the basis of successful co-operation in industry.

The sun has rapidly been sinking on the day of shirt-sleeve intimacy. While there are still a small number of concerns in the country where the owner can walk through the plant without his coat and say "Morning, Joe," or "Howdy, Frank," to his men, they are gradually being displaced by big business. Big business has wiped out most of this spirit of fellowship and good feeling and replaced it with the idea on the part of the men that the "big chief" is some kind of an individual who wears strange clothes and has a black string hanging from his eyeglasses and that to "put anything over" on him and get away with it is legitimate.

INTEREST SHOWN WORKER IS RECIPROCATED

About ten years ago group insurance began to make itself heard as a means of stabilizing labor and improving the employee's general attitude toward his work. By promoting unity and co-operation it tends to increase production; in fact it has been one of the most effective of the efforts made in many plants to bring back the "good old-fashioned" spirit. While providing protection to the worker's home and family it at the same time gives tangible evidence that the employer is interested in the things closest to his workers.

Whether an employer purchase group insurance for business reasons, such as reducing labor turnover, or because he wishes to be a benefactor of society, the benefit will be felt in both directions. But the advantages of group insurance are not restricted to the shop, for when the family of the worker become acquainted with the plan they realize how closely they are concerned in its benefits and their interest soon results in active support. Internal dissension in the plant often is stirred up by radical minds, and to have the home on the employer's side is to have a powerful ally.

What Group Insurance Is.—Group insurance is a quantity-purchase proposition. By purchasing insurance protection for all or any division of his employees numbering fifty or more an employer is quoted group

rates that are considerably lower than the rates for individual policies of equal size.

One blanket policy is issued to the employer, and individual certificates are presented to the employees protected. The employee has the privilege of naming his own beneficiary and he also may change the beneficiary he has named if occasion requires it.

One of the attractive features of group life insurance is that except in the States of Georgia and Oklahoma no medical or physical examination is required. The only stipulation from the physical standpoint is that the employee be actively at work upon the day the insurance goes into effect. If for any reason an employee is not able to be at work upon the date the insurance becomes effective, he is entitled to his certificate upon his return to active service. Age limits are entirely ignored by this clause. The man who is too old to get insurance is taken in along with the younger members of a concern and receives his protection without question.

Insurance records show that approximately 20 per cent of all people applying for life insurance are rejected because of inability to pass the required physical examination. These figures are based on all applicants and as the so-called white-collar workers are more numerous in this list than men of industry, it is reasonable to assume that this percentage would be considerably higher among industrial workers. Thus people who could not get life insurance protection individually are enabled to get it through group insurance.

Over 40 per cent of the working people carry no insurance protection, and their widows, children and mothers are often left destitute, an object of the employer's, or of public charity. Experience shows that over 50 per cent of the group insurance claims paid go to relieve direct distress.

INDIVIDUAL SELECTION OF EMPLOYEES UNLAWFUL

Group Plans.—Individual selection of employees for different amounts of insurance under the group plan is prohibited by law. There must be a definite schedule. These schedules have gradually worked themselves into three different classes known as the flat amount, salary, and length of service schedule.

As its name indicates, the flat-amount basis places an equal amount of insurance upon all employees.

The salary schedule divides the employees into different classes according to their yearly earnings, and places a different amount upon each class. For example, all employees earning \$1,000 per year or less may receive a \$1,000 certificate, those whose yearly salaries are over \$1,000 but less than \$2,000 to receive a \$2,000 certificate, and those making over \$2,000 could receive a \$3,000 certificate.

The length-of-service form has proved very popular

because of its increasing rewards to employees remaining with the company for a long period of time. The length-of-service idea is carried out in the following manner: A certificate may be issued to an employee for the starting amount, say \$500, three months after he joins the working force. To this original certificate is added the sum of \$250 upon his first anniversary with the company; after he has been with the organization two years his insurance will be increased to \$1,000, and so on, giving him a \$250 increase every year until he is receiving the maximum amount set by the company.

Minimum and Maximum.—The above examples are not arbitrary. Interesting combinations have been worked out to fit unusual conditions. The minimum amount of insurance that can be placed upon any individual under the group plan is \$500. The maximum may rise to \$5,000. Any amounts within these limits can be established for the flat amounts. On the salary and length of service basis the amounts for the different classes or the size of the increase can be fixed according to the wishes of the purchaser.

Probationary Period.—It is customary to enforce a probationary or waiting period before new employees participate in the plan. This period usually runs from three to six months although in many cases local conditions indicate that a shorter or longer period might be desirable. The waiting period is particularly effective where the industry has been in the habit of supporting a large floating element. An employer is reasonably sure that the new worker is not of the migratory type if he has remained with him six months or a year, and the period can be established so that the insurance can go into effect after that time.

Permanent Disability.—In the back of the minds of nearly every workman there lurks a constant dread of the possibility of being entirely deprived of his earning capacity, but the worker protected by group insurance need waste no worry thinking "What will become of me and my family should something happen to me and I be no longer able to earn my living." For the group insurance certificates guarantee to pay the entire amount of the insurance in cash instalments to any worker who becomes totally and permanently disabled before reaching the age of sixty.

ON LEAVING COMPANY CAN RENEW INSURANCE

Continuance Privilege.—When an employee leaves a concern carrying group insurance, that employee's insurance is immediately and automatically cancelled, but he has the privilege of converting into any standard life insurance policy at regular market rates for his attained age without physical examination by applying to the insurance company within a certain prescribed time after he leaves his employer.

Cost.—Individual certificates are issued to employees protected by group insurance at a cost to the employer of approximately 40 per cent less than what an equal amount of insurance would cost the worker in the open market. Furthermore the worker could only receive insurance he purchased himself provided he could pass the physical examination required by insurance companies.

Group insurance can be carried by the insurance companies at a more moderate rate than individual policies because the blanket policy form cuts down administrative expense. As there is little administration by the insurance company there is even less clerical detail incurred by the purchaser of a group policy.

Employees leaving an organization usually are offset by new ones taken on and in this way the new applications and the cancellations offset each other.

Further simplification has resulted from the fact that practically all transactions are based on an average cost worked out when the contract is installed. This eliminates different amounts for various ages. Furthermore, the usual technicalities connected with the paying of insurance claims have been eliminated. No affidavits or proof beyond the employer's and the physician's statement are required.

The insurance company carrying the group insurance usually furnishes the policyholder with a card file index, and complete card record of the group. Many companies are using this outfit for their own personal records. Some have had no such records before.

LITTLE CLERICAL WORK REQUIRED OF COMPANY

Average cases have been worked out and it has been found that one clerk can handle all the clerical detail for a group of 100 in one to two hours, 250 in three to four hours, 500 in less than one day a month, 1,000 in a day, 5,000 in three or four days a month.

Group life insurance has no connection with workmen's compensation insurance. It affects it in no way, and its benefits are entirely in addition to it.

To show that there is nothing experimental about group life insurance a few facts may be given. The Metropolitan Life Insurance Co., only one of several big writers of this kind of insurance, has more than fifteen hundred companies insured under this plan. Nearly half a million workers enjoy group life insurance protection from this company alone.

The records of this company indicate that group insurance is popular with coal operators. Over five years ago it had not placed its group insurance with a single coal company. Since then about seventy coal concerns have been insured and the protection now covers more than 20,000 employees of coal mines. Not a single coal company has ever cancelled its contract with the Metropolitan Life Insurance Company because of dissatisfaction.

Factor in Public Opinion.—The attitude of the employees toward the company that employs them is a factor in guiding public opinion. Huge sums of money are spent every year by large employers of labor to create favorable public opinion. This effort often is counteracted, especially in the locality of the concern and its branches, by the impulsive propaganda of dissatisfied employees. The comment, conversation and spirit of the employee who is quick to rise to the defense of his company whenever he discovers an attack, direct or indirect, is something whose value is multiplied as many times as there are satisfied employees on the payroll.

Other Benefits.—The cost of production is made up of many elements. Material, wages and overhead costs are generally well known. In many efficient institutions the money expended in training an employee for his work has been carefully worked out and there is no doubt that it is a considerable figure. Every time an old employee leaves, the cost of training a new one to fulfill his place increases the production cost. When Herbert Hoover's committee which investigated waste in industry published its report in a book called "Waste in Industry" some time ago startling evidence was produced revealing the enormous amount of money lost as a result of poor workmanship and the production of damaged goods by poorly trained employees.

Further than this, there is a waste that is practically impossible to compute, due to employees not working as efficiently or conscientiously as they are capable. While this last can hardly be figured, we all appreciate the gigantic size that it reaches. Often it is due to a lack of understanding between workers and employers.

By bringing about a sympathetic understanding between the company and its employees, group insurance tends to increase production. By furnishing an attractive incentive for employees to remain where they are fairly treated, group insurance exerts a strong tendency toward stabilizing labor conditions, and thereby assist in reducing the cost of production.

The relative extent of labor turnover is determined more, perhaps, by the length of service of the employee than by any other single factor. Men who have been working harmoniously together over an extended length of time learn to understand each other and the principles of team-work and *esprit de corps* are thereby fostered.

With Track Shifter One Man Can Raise and Throw Over Railroad Track

MUCH has been written as to the efficiency with which distant-removal stripping is done in the iron regions, using the largest dump cars and heavy standard-gage track. The work furnishes an excellent illustration of what might be done in the stripping of anthracite. How to dump is as much a part of the "trick" of such stripping as how to load and to transport the overburden. In the Mesabi region not only the overburden must be dumped but the siliceous streaks of ore, known as "paint rock." This is placed in a separate pile, as it may become valuable. Prominent objects in the featureless scenery are the many low mounds of overburden and paint rock.

In the City of Duluth the Lake Superior Loader Co. is making a track lifter and shifter which enables one man to raise the track, ties and all, and move it over if desired, all in one operation. Its availability for distant-removal stripping in the anthracite region and elsewhere is evident. Of course the track when raised needs to be underpinned and consequently the track-shifter is equipped so that it will transport eight men and their tools. As will be noted from the illustration, the machine moves and operates under its own power. It will travel at a speed of 30 miles per hour on a level track and 20 miles an hour up an adverse grade of 4 per cent.

The machine, when shifting, is made to plant a heavily shod leg or "spud" on the track, the leg being inclined at an angle so that when the shifter is caused to climb

it, bringing the rail with it, it tends to fall toward the edge of the dump, dragging the track in the same direction. The climbing mechanism is a toothed wheel which engages a rack in the side of the shifter leg. The action is somewhat like that of a vaulter who uses a pole to aid him in his flight.

The track is seized by four rail clamps suspended from the shifting truck. These are stationed on either side of the shifter leg and between the wheels of the machine. The track is not broken at any of the joints but is lifted and shifted without any such provision. When one shift has been made, the shifter moves under its own power backward or forward two rail lengths and there repeats the operation. The claim is made that the number of men needed to make the shift is cut down one-half and the time consumed 75 per cent. Thus the work of the shovels is not impeded. It is said that the rail is not kinked nor the tie plates bent.

By planting the spud in the center line of the track and in a vertical position the track is not swung from line but is lifted vertically. Where the track is buried or frozen it is best to use the shifter to lift the track from its position for a few rail lengths. Then the shifter can be readjusted and run back over the same track length, shifting it into place as already described. The power is provided by a gasoline engine mounted in front of the truck. The lifting force is 25 tons and the machine is 10 ft. in length, 7 ft. wide and 8 ft. high. The length of the spud is 7 ft. The shifter weighs 4,900 lb.

Upkeep of Steam Shovels Engaged in Stripping and Loading

THE following records are from a book on "Upkeep Costs" compiled by the Erie Steam Shovel Co.:

Operating Company	Mine	Yardage	Material	Upkeep in hundredths of a cent per cubic yard.	Upkeep Cents per day
Commonwealth Fuel Co.	Douglas	156,000	Clay & Gravel	14	
Ocala Lime Co.	Ocala, Fla.	900,571	Coal		
		190,000	Rock		
		90,000	Earth	18	65
Kennedy Refractories Co.	Tiffin, Ohio	179,856	Rock		
		57,332	Earth	43	
		10,000	Coal		
		3,000	Iron Ore		
Gay & Hays	Greensburg, Pa.	18,486	Earth	5	27
		59,156	Shale		
		55,458	Coal		
Vielhauer Coal Co.	Dover, Ohio	300,000	Earth & Shale	5	29
Keystone Limestone Co.	Millville, W. Va.	200,403	Shallow Earth with rough rock bottom.	20	57
		139,000	Earth		
		138,000	Frosted Earth, Rock and Hardpan	60	25
Penn. Products Co.	Dillsburg, Pa.				

It should be noted that all these shovels are of small to medium size.

New Equipment

Automatic Sectionalizing Contactor for Trolley and Feeder Circuits in Mines

RELATIVELY new type of sectionalizing contactor giving automatic circuit-breaker protection, time delay and lockout features generally required in mining service has just been brought out.

It is designed for application between feeder or trolley sections and prevents an interchange of excessive amounts of current between the sections which it connects. It is fully automatic, opening on overloads and reclosing only when the potential difference between the sections is sufficiently small to limit the flow of current on reclosure to less than the overload setting of the relay.

The equipment, which is assembled on the slate panel in the box shown in Fig. 1 consists of the following apparatus: main contactor, overload relay, holding relay, snap switch, fuses, resistor and terminals. The contactor is of proved design and construction having arc chutes and magnetic blow-out coils, features highly desirable for this service. The overload and holding

FIG. 1—AUTOMATIC CONTACTOR ENCLOSED

This device gives automatic-circuit breaker protection, reset and time-delay features. Enclosed in a box it may be locked and will perform without any further control equipment or devices.

relays are similar except for the coils—and are simple and reliable in operation. The overload relay has a series overload coil, while the holding relay has a shunt operating coil. Both are automatically reset.

Referring to the wiring diagram, Fig. 3, which is a simplified arrangement of the factory diagram shown in Fig. 2, the arrow points show the direction in which the plungers move when sufficient current is applied to the coils.

On the occurrence of an overload exceeding the setting of the overload relay, this relay will operate, opening its lower and closing its upper contacts. The opening of the lower contacts de-energizes the operating coil of the main contactor, causing the contactor to open. At the same time the closing of the upper contacts energizes the coil of the holding relay, causing this, in turn, to open its contacts.

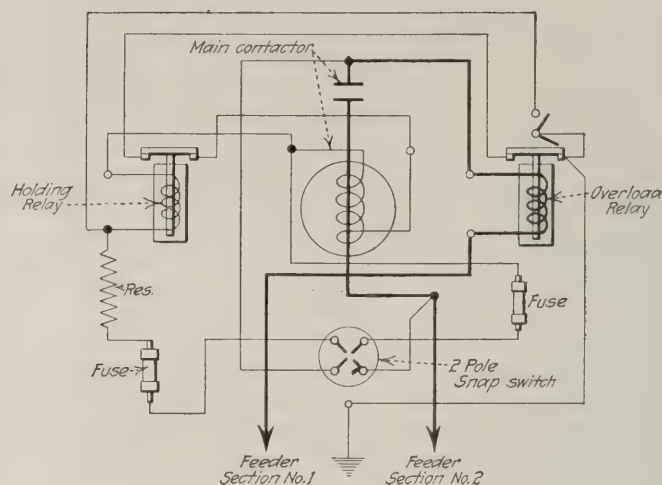

FIG. 2—FACTORY WIRING DIAGRAM

The wiring diagram shows the relative location of the equipment illustrated in Fig. 1, showing the interconnections between the control devices.

When the main contactor opens, the overload relay is de-energized and immediately resets. If the voltage difference between the two feeder sections—the voltage across the contactor—exceeds a given minimum, the holding relay will remain energized, as its coil—with resistance in series—is connected directly across the contactor, thus preventing the contactor from reclosing.

When the voltage difference drops below the minimum value, however, the holding relay is de-energized and causes the contactor to reclose. This feature prevents the reclosure of the contactor unless it is safe to do so: that is, if it does reclose, the current flow from section 1 to section 2 will not exceed the overload setting of the relay and cause the contactor to reopen immediately. In this way sections of feeders on which faults occur, may be cut off from other sections automatically, and later be automatically reconnected as soon as the fault is cleared and voltage properly re-established on the line.

These sectionalizing contactors which are manufactured by the Westinghouse Electric & Manufacturing Co., are made in various sizes up to 1,250 amp. for either 275 or 600-volt service. The relays have wide ranges of settings so as to trip the contactor at any desired load and re-establish service with any desired percentage of dead load floating on the line when the contactor is open. For special conditions the company has worked out many applications for this contactor with a few changes in the circuits or the adaptation of additional relays.

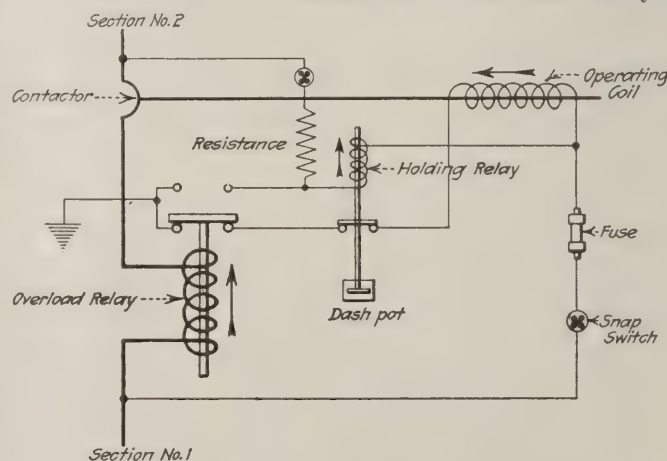

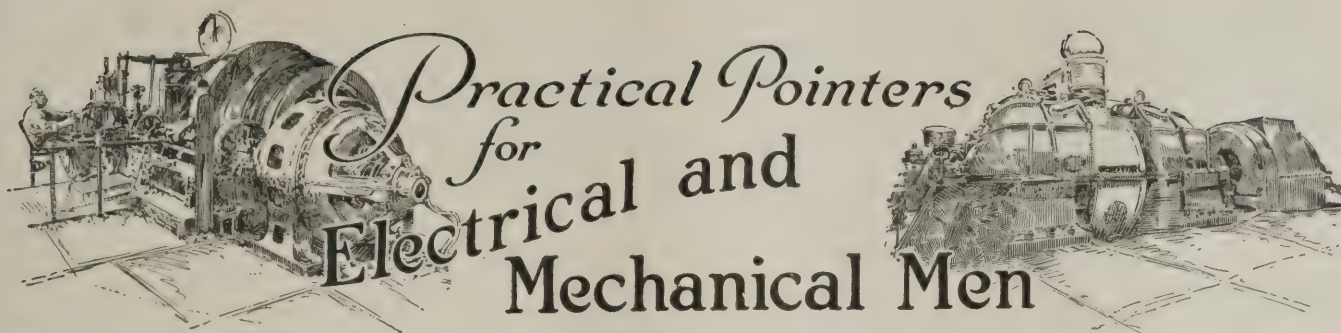

FIG. 3—SIMPLIFIED WIRING DIAGRAM

The operation of the contactor may be readily understood by making reference to the text. The raising of the plunger in the overload coil opens the circuit through the operating coil and opens the contactor. Then the holding relay functions to lock out the contactor until it is safe to re-establish service.

Putting Pinions on Mine Type Locomotive Armatures

MANY of the pinion failures on electric mine motors are caused by putting the pinions on incorrectly.

Driving a Pinion.—It is generally believed that if a pinion is shoved on the shaft and the nut tightened, it will run satisfactorily without loosening. Experience has shown that in order to obtain satisfactory operation, pinions should drive their gears through the "press fit" or "shrink fit" on the shaft and not through the key. The key acts merely as a safety device if the pinion should accidentally loosen. The desired fit for the pinion can be had by heating or by pressing.

Precautions.—The following points should be observed when putting pinions on railway motor shafts with taper fit:

(1) The shaft should be clean and free from burrs or swellings.

(2) The pinion bore should be clean and free from burrs.

(3) The fit of the pinion bore should be in contact with at least three-quarters of the surface of the taper fit on the shaft. This can be checked by rubbing Prussian blue, thin red lead and oil, or thin lamp black and oil on the pinion bore and fitting it on the shaft.

(4) After the above points have been taken care of, the pinions should be put on the shaft cold to make sure (a) That the keyway in the pinion is the proper size for the key mounted on the shaft; (b) That the pinion does not ride or bind on the top and sides of the key and will not ride the key when pressed further on.

The keyway on the pinion can be 0.002 in. larger, but not less than the key. There should be at least $\frac{1}{16}$ in. clearance between the top of the key and the bottom of the keyway in the pinion. The corners of the key should not cut into the fillet of the keyway. To prevent this the corners of the key should be rounded.

PRESSURES FOR PUTTING ON PINIONS

Pressing on Pinions.—Pinions can be pressed cold onto the shaft with a wheel press. The pressure required will be 12 to 25 tons for pinions up to 125 hp. and 40 to 80 tons for pinions transmitting 125 hp. or over. A 25-to 50-ton press can be used for pinions up to 125 hp. and a 100-ton press for pinions above 125 hp. Pinions with bores up to 3 in. that are pressed on cold should advance on the shaft approximately $\frac{1}{2}$ in.; those with 3- to 4-in. bore, $\frac{3}{4}$ in., and those with 4- to 5½-in. bore, $\frac{1}{2}$ in. This distance is measured from the point where the pinion is seated firmly on the shaft before pressing.

Heating Pinions for Motors Up to 125 hp.—Pinions up to three inch bore should be heated in boiling water for 30 minutes, and those with 3-in. or larger bore for

60 minutes. When the pinion has attained the temperature of the boiling water, namely 100 deg. C. (212 deg. F.), it should be taken out of the water and the bore quickly wiped clean. Without allowing the pinion time to cool, it should be tapped on the shaft with a 6- or 8-lb. sledgehammer, using a heavy piece of wood or copper between the pinion and the hammer. This sledging is not to get a driving fit but to make sure that the pinion is home and well seated. Three or four taps evenly distributed around the pinion end should be enough. The pinion nut with lock washer can then be screwed home tight with a wrench having a purchase or lever arm of 3 or 4 ft.

A suitable pinion heating arrangement is shown in Fig. 1, the water being heated by an electric heater. A gas flame or a steam coil, however, could be used instead. To prevent rusting and to insure a clean surface at the fit, washing soda should be added to the water in the proportion of $\frac{1}{4}$ lb. of soda to 5 gallons of water.

Heating Pinions for Motors Over 125 Hp.—The pinions should be heated with a gas flame applied in the bore of the pinion in such a manner as not to touch the teeth of the pinion, as this might affect the temper. The flame should be so regulated as to take 45 to 75 minutes to bring the pinion to a temperature of 125 to 150 deg. C. (257 to 302 deg. F.). The temperature can be measured by placing the bulb of a thermometer against the pinion between the teeth. The surface of the pinion where the bulb touches it must be made perfectly clean by rubbing with emery cloth. It also is important to protect the exposed part of the thermometer by covering it with asbestos cloth so that the flame cannot touch the thermometer.

When the pinion has reached the correct temperature

FIG. 1—ELECTRICALLY HEATED PINION HEATING TANK

An electrically heated tank can be used with the greatest success owing to the ease with which the heat may be controlled.

the bore should be wiped clean and the pinion put on the shaft in the same manner as suggested for pinions for motors up to 125 hp.

Heating Apparatus.—Any furnace in which the pinion is so located that the flame cannot touch the teeth can be used for heating pinions. The flame can be regulated and the pinions kept at a temperature of 100 deg. C. (212 deg. F.) for pinions up to 125 hp., or 125 deg. C. (257 deg. F.) for 125-hp. motors or larger, until the mechanic is ready to apply them.

Results.—Pinions put on after boiling in water will hold when cool with a pressure of from 12 to 25 tons, and those heated above 125 deg. C. and not more than 150 deg. C. with a pressure of from 40 to 80 tons, depending on the length of fit of pinion and the diameter of the bore. By following these directions it is possible to put pinions on armature shafts that will stay put and drive through their fit under the very hardest pulling from the motor.

How to Babbitt Motor Bearings

TO CLEAN cast iron, malleable iron or cast steel shells (untinned) remove all the old lining from the shell. This may be done by heating the shell sufficiently to melt out the old lining. Remove all oil, dirt or other foreign matter by dipping the shell in a solution of caustic potash or by burning. If the burning method is used, continue the burning until all smoke ceases, showing that all oil and dirt have been burned off; then scrape the surface with a file and rub down with coarse sandpaper to remove all scale and oxide.

Bronze, Pipe or Steel Shells (Untinned).—Remove the old lining by heating, preferably in a pot of scrap babbitt, and be sure not to heat above 375 deg. C. As soon as the old lining is melted out, swab the tinned surface with zinc chloride (a saturated solution of zinc in hydrochloric acid), then dip into a pot of "half and half" solder, which should be kept at a temperature not less than 340 deg. C. and not more than 375 deg. C. If shells are to be babbitted immediately, do not touch tinned surface after removing from the solder pot. If the shells are to be allowed to cool, brush off the tinned surface with a piece of clean waste.

Tinning Bronze or Steel Shells.—Paint with a thin mixture of graphite and water the parts not to be tinned. When dry swab with zinc chloride the parts to be tinned, then dip the shell into a pot of "half and half" solder, which should be kept at a temperature not less than 340 and not more than 375 deg. C. Leave the shell in the solder until it is just hot enough for the solder to run off, leaving a thin coating. Remove the shell from the pot and rub the surface to be coated thoroughly with a swab saturated with zinc chloride, then dip in solder again to wash off all traces of zinc chloride. If any untinned spots can be detected on the surface to be babbitted repeat the operation. If shells are to be babbitted immediately do not touch tinned surface after removing from the solder pot. If the shells are to be allowed to cool, brush off the tinned surface with a piece of waste.

Steel shells must be pickled to remove the scale before being tinned.

Iron or Steel Shells (Untinned).—Preheat the mandrel to a temperature of approximately 150 deg. and the shell to 100 deg. C. If the shell is heated too much, the length of time for cooling may be so prolonged that the heavier metals in the babbitt will have time to settle

to the bottom end of the bearing, in which case the metal in one end of the bearing will be soft and in the other end brittle, while if the shell is too cold it will cool the babbitt too suddenly and cause it to shrink away from the shell. After each bearing is poured, swab off the mandrel with a piece of waste which has been dampened with clay wash. This leaves on the surface of the mandrel a thin layer of fine clay dust, which has been found to be of great assistance in producing smooth, clean bearings.

Bronze or Steel Shells (Untinned).—Preheat the mandrel to about 100 deg. C. The same reasons for having the temperature correct apply here as given under preheating of mandrels for iron or steel shells. After each bearing is poured it may be found necessary to cool the mandrel. This is done by dipping it in a clay wash, which leaves a layer of fine clay dust, the same as the swabbing for iron and steel shells. When the mandrel is at the proper temperature, the water of the clay wash will evaporate quickly on the surface of the mandrel, but will not spatter vigorously. The brass shell is preheated in the tinning operation and should be babbitted immediately after it has been tinned, before losing the heat given to it by tinning.

Melting.—Melt the babbitt in an iron pot or kettle, and maintain at a temperature between 460 and 470 deg. C. It is necessary that this temperature be maintained when pouring bearings and that the maximum temperature of 470 deg. C. be not exceeded at any time, as in certain grades of babbitt the metal is irreparably damaged if this temperature be exceeded. The use of an automatic regulator is necessary to hold the temperature within these limits. Stir the metal thoroughly at frequent intervals; otherwise the heavy metals will settle to the bottom of the pot. Keep the babbitt covered with charcoal or graphite to prevent oxidation.

Pouring.—Pour from a ladle in a steady stream directly down along the mandrel to avoid splashing or pocketing of air. The lip of the ladle should be kept free from burrs or other surface irregularities in order to pour a smooth, round stream. If the metal is splashed against the mandrel it will cause blowholes and give a mushy bearing.

Summary.—Pouring temperature for babbitt—460 to 470 deg. C. Temperature of "half and half" solder for tinning—340 to 375 deg. C.

Preheat iron and steel shells—100 to 150 deg. C.

Preheat bronze shells in tinning operation.

Preheat mandrel for iron and steel shells—100 to 150 deg. C.

Preheat mandrel for bronze shells—100 deg. C.

Railroads Consume Less Coal in May

Class I railroads of the United States consumed 9,034,000 net tons of coal during May, 1923, as charged to account 394, compared with 9,373,000 tons during the preceding month and 6,964,000 tons in May, 1922, according to a recent report of the Bureau of Statistics of the Interstate Commerce Commission covering 177 steam roads. During the first five months of 1923 these roads consumed 48,578,000 tons as compared with 38,328,000 tons during the corresponding period of 1922. The delivered cost per ton in May last was \$3.47 compared with \$3.55 for the corresponding month of last year.

Consumption of fuel oil during May totaled 155,062,000 gallons compared with 147,694,000 gallons in April and 118,429,000 gallons in May, 1922. The totals for the first five months of 1923 and 1922 were 744,894,000 and 593,499,000 gallons respectively.

Problems of Operating Men

Edited by
James T. Beard

Abnormal Roof Conditions Require Special Study

Observed Peculiarities in Roof Conditions Working the Miller Seam—Roof Breaks to Great Height with Little Warning—Need for Careful Study

FROM time to time, I have referred incidentally and in a suggestive way to a condition that has come under my observation in working the Miller or "B" seam. This was done in the hope of eliciting an expression of opinion in regard to the probable cause of the roof conditions that many must have observed and contended with in the working of that seam.

As yet, the subject has not received the consideration it demands and, for that reason, I beg to again draw attention, in a more direct manner, to the sudden breaking of the roof strata when driving openings in that seam. These breaks will frequently extend to an indeterminate height, even in narrow workings. The condition is peculiar to the Miller seam, which suggests that there must be some definite underlying cause, as yet unknown or but partially understood.

ROOF FALLS DUE TO PRESSURE OF GAS OR WATER

When discussing the cause of these occurrences, with practical mining men, the opinion has generally been expressed that they are due either to gas or water. That each of these factors is capable of producing powerful effects in creating pressure cannot be denied. However, before we can ascribe the observed conditions to the action of either of these agencies, there must be evidence to support our conclusions.

In the instances that I have observed, all evidence has been lacking of the existence of either water or gas, previous to or immediately following the breaking of the roof. While it is true that one instance occurred in a mine generating small quantities of explosive gas, the other took place in workings where no gas was generated.

In respect to water, in the former instance, there appeared no indication that would suggest an excessive pressure from this cause, the quantity of water present being far less than what might be expected from the height of the cave and the local conditions. In the latter case, however, there was no evidence of water in the strata and we must look elsewhere for the cause.

PRESENCE OF GAS OR WATER PLAINLY MANIFEST

In my own experience and, I believe, in that of others also, where a roof fall has resulted from the pressure of gas or water, the presence of these elements has been manifest and the cause of the trouble was clearly evident, because the agencies that brought it about were plainly seen and their effects realized in a manner that left no doubt in the practical mind.

Now, in reference to the roof conditions observed in the working of the Miller seam, there can be no doubt of the existence of a producing cause other than those I have mentioned. It is possible that the sudden rupture of the roof strata, in certain cases, may result from a local condition such as the near approach of the excavation to a weakened barrier that is incapable of supporting the pressure thrown upon it in the progress of the work.

Again, the trouble may result from an undue concentration of pressure from a cause that is persistent over the entire area. My inclination is to attribute the observed conditions more generally to this latter cause. Where the Miller seam is overlaid by the upper seams of the lower geological period, or even by the next higher seam, which is the "C" seam, it is subjected to a pressure caused by the expansion of the limestone stratum lying between the two seams.

HIDDEN CAUSE FOUND IN OVERLYING SEAM

From long observation in several widely separated localities, it is known that this limerock has been subjected to the action of water with the result that the coal of the C' seam has been badly ruptured. In places, the disintegration has left nothing but a soft deposit through which an iron bar can be easily forced. In other instances, as appears in the accompanying

SHOWING RESULT OF DISINTEGRATED STRATA

figure, the stratum has been partially removed allowing the coal to drop from its natural position so as to leave a space of from 6 to 12 in. between roof and coal.

My thought is that, in view of these facts, it is not unreasonable to assume that this disrupted condition in the strata overlying the Miller seam may be responsible for a concentration of pressure that is, perhaps, the chief cause of the abnormal conditions existing in the roof of that seam. It is possible that I am in error in assuming the exact location of the cause as being in the limestone underlying the C' seam.

While there may be other strata of a nature similar to the limerock mentioned and whose disintegration has caused the disruption of the roof of the Miller seam, I believe the assumption to be correct with respect to the general producing cause. I have referred to the rock underlying the C' seam only as illustrative of this condition, which I am inclined to think is responsible for the difficulty.

Let me say, in closing, that mining is an industry that must be conducted subject to the effects produced by physical causes. The more accurate knowledge we have of those causes, the better we will be able to contend with and overcome their effects.

Washington, D. C.

I. C. PARFITT.

Action of Gas in Roof to Cause Sudden Breaks

Timbering weak roof must closely follow extraction of coal—Air current disintegrates roof rock—Pressure of gas causes high falls.

ATTENTION was drawn, some time since, to the sudden breaking of the roof at times when it is least expected to occur. If I recall correctly, the writer of the article had reference particularly to mining conditions existing in the Miller seam, which I think was being mined not far from Pittsburgh.

Since reading the article, I have been turning the matter over in my mind, at different times, and now desire to offer a few remarks regarding the possible causes of sudden breaks in mine roof. What I have to say is drawn from my own experience and observation regarding similar occurrences in the mining of coal in other districts.

It has been my practice when driving places under weak roof to have the timbering closely follow the extraction of the coal. Even then, it has often been necessary to provide other supports between the timber sets, in order to prevent the continual dropping of small fragments of the roof slate on the road.

FACTORS OPERATING TO BREAK MINE ROOF

Owing to the disintegrating action of the air current on the roof the trouble is greater at times than at others. It is always greater in summer than in winter, because the current then carries more moisture, which is rapidly condensed in contact with the cooler rocks in the mine. I have observed the action taking place more commonly in shallow mines where the workings are extended a considerable distance underground.

Beside the disintegrating action of the air on the roof, however, there is another factor that must be regarded as greatly affecting the strength of the roof and causing it to break suddenly. I refer now to the pressure of the gas that may exist in the roof strata. This pressure is often very considerable and far exceeds that of the atmosphere acting to support the roof.

So great is the difference between the possible pressure of the gas in the strata above and that of the atmosphere below, that any slight changes that may take place in the atmospheric pressure will have little influence in determining the tendency of the roof to fall. However, it is conceivable that a sudden diminution of atmospheric pressure may accelerate and assist the action of the gas in breaking the roof.

At times, it may happen that the gas emanates from an overlying seam of coal and extraction of the coal

in the seam below causes expansion of the gas and its pressure is exerted to break the intervening rock separating the two seams. Or a somewhat more impervious stratum may cause an accumulation of gas under a greatly increased pressure and give rise to an outburst in the seam below when the opportunity is offered.

REMEDY WHERE GAS ACCUMULATES IN ROOF

Where the roof is a slaty shale and gas exists in the overlying strata, its pressure will often fracture the roof when driving openings in virgin or solid coal. The breaking of the roof in such instances is caused not so much by the weight of the roof, as by the pressure exerted by the gas. The force thus acting along the line of an opening may have a powerful leverage that will enable it to break a fairly strong roof.

In the working of some fiery seams, I have known holes to be drilled up in the roof to a depth of four or five feet with a view of draining off the gas and relieving its pressure on the roof and rendering the latter less liable to be broken down. The effect of relieving the pressure of gas in roof strata is plainly manifest both in longwall and pillar workings where a heavy roof fall greatly relieves the pressure on the remaining pillars. It is well known that after the first break occurs, in longwall working, it is far easier to control the pressure on the face of the coal and this, in many instances, is largely due to the relief of the gas pressure in the strata above.

Bay City, Mich.

WILLIAM DICKINSON.

Deep Mining in Belgium

Necessity for deep mining of coal in Belgium not due to exhaustion of mines. Desire is to supply coking coal for blast-furnace use and make its steel industry independent of other countries.

Sometime recently, reference was made in *Coal Age* to deep coal mining in Belgium (Vol. 23, p. 722) and in responding to the request for information on that subject, I showed that there were a number of coal shafts in that country whose depths ranged from 1,000 to 1,200 meters, and one reached a depth of 1,240 meters (4,068 ft.)

At that time it was not explained why the mining of coal was carried to such great depths in Belgium. It was naturally assumed by many that coal seams lying nearer the surface had been worked out and exhausted. That such is the case, however, is far from the truth.

Enough coal remains available, at depths between 250 and 750 meters to keep that country's production through several centuries longer at an annual rate of 35 million tons. The present capacity of the mines, however, does not exceed 25 million tons a year, but there is good reason to expect that the higher figure mentioned will be reached before five more years have passed.

The reason why Belgium has sunk many of its shafts to such great depths is solely to reach a good quality of coking coal needed for the blast furnaces and make the country's steel industry independent of foreign supply.

At the present time Belgium produces enough gas, steam and domestic coals to export an appreciable tonnage of these after supplying its own requirements; but it must import 70 per cent of the coal necessary to make the coke needed for its blast furnaces.

Belgium's present supply of domestic coking coal is

limited to the tonnage obtainable from that part of the lower coal measures thrown upward by geologic disturbances sufficiently to permit of their being mined by tunnels driven across the strata from more shallow shafts. But these shafts will soon have to be sunk deeper before reaching the coal lying in regular formation.

A number of the shafts just mentioned have been already deepened or are now being sunk to where the best quality of coking coal is expected to be found—the territory known as the "Great Flats." Some of these shafts will be 5,000 ft. deep before they can develop into good sized operations in the coking beds.

It is of interest to state, here, that the seams found in the lower measures, the coking seams, are those in which have occurred all the outbursts or blowouts recorded in Belgium, since these have occurred there, the earliest on record being in 1847. What is known of these occurrences, their causes and the phenomena that accompany them, encourages the belief that where the seams lie in regular formation, there will be less danger of their occurrence than in the disturbed territory to which operations have been thus far confined.

The "Great Flats" are also expected to present other natural advantages that promise cheap mining; namely, absence of faults, regularity of grades and greater uniformity in mining. In this system of development of their mines, the Belgian engineers have shown foresight and judgment that is commendable. Not only will they be able to produce cheaper coal, but the country will be independent of foreign supplies for maintaining its steel industry.

If present expectations are fulfilled, Belgium will produce a much larger tonnage of coking coal than they will need for home consumption and will be able to export much of the output to France where coking coal is scarce. This will not interfere with their present exportation of gas, steam and domestic coal.

Hoisting and ventilating are the two main problems always connected with deep mining. The first of these problems the Belgians have long since proved they know how to handle. At all the deep shafts in that country hoisting is done by the use of 4-deck cages guided by steel rails and run at a speed of 61 ft. a sec. In the region of Limbourg, a number of new shafts, having diameters of 20 ft. in the clear, are now being sunk. Each shaft is intended to hoist 2,000 tons per 8-hr. shift, from workings operated more than 4,000 ft. deep in the "Great Flats."

Ventilation presents quite a problem owing to the high temperature of the strata at the great depths mentioned as reached or to be reached. Nothing but a large abundance of rapidly moving fresh air will make this temperature bearable for man. Belgian coal seams average less than 30 in. in thickness, which makes it necessary to give the workings a great extension, in order to obtain the large outputs necessary to make such deep and difficult operations pay.

In order to drive large volumes of air through extensive, narrow and complicated openings it requires a high water gage. Fans of the Rateau system, developing water gages as high as 12 in., are coming more and more into use. These fans are capable of circulating 350,000 cu.ft. of air per minute through some of the deepest and narrowest mines of the country. All of the mines in Belgium are ventilated by exhaust fans as this is made compulsory by law.

Quaregnon, Belgium.

Inquiries Of General Interest

Finding Length of Prop Timber on Steep Pitches

Length of Prop Depends on Amount Timber Is
Underset and Is Independent of Pitch of Seam—
Conditions in Seam Determine Underset of Post

KINDLY explain for our information, through the interesting columns of *Coal Age*, how to estimate the length of a prop that is underset so as to make an angle of 9 deg. with the perpendicular in the seam, assuming that the coal is 6 ft. thick and the seam has an inclination of 54 deg. Also, state if there is any way to determine the underset of a prop in seams of different inclinations, without resorting to the use of a table of sines, cosines, tangents, etc. INQUIRER.

Hiteman, Ia.

Referring to the accompanying figure, the line *od* is normal or perpendicular in the seam, its length being equal to the thickness of the seam.

UNDERSSETTING A
POST INCLINED
BEAM

Extending this line and drawing the parallelogram *dbac*, the diagonal *ad* is a vertical line and the angle *dac* is the pitch angle corresponding to the inclination of the seam. This must not be confused, however, with the angle that the prop makes with the perpendicular, which in this case is 9 deg., while the pitch angle is 54 deg., the inclination of the seam being somewhat greater than that shown in the figure, but the principle is the same in any case.

The amount of the underset of a post must be determined by one's practical experience in the seam in question. While it increases with the steeper inclination of the seam, the underset of a post bears no positive relation to the pitch of the seam, but is dependent on conditions that can be determined only by practical experience in the working and timbering of the seam.

MUST ALLOW FOR THICKNESS OF WEDGE

Having decided on the amount of the underset of a post, or the angle it is to make with the normal in the seam, in any particular case, divide the thickness of the seam, expressed in inches, by the cosine of this angle, which will give the length of the post corresponding to the thickness of the seam. To this must then be added the difference between the depth of the foothold cut in the floor and the thickness of the wedge that is driven between the top of the post and the roof.

For example, taking the thickness of the seam as 6 ft. (72 in.), the corresponding length of a post when set at an angle of 9 deg. with the perpendicular in the seam, is $72 \div \cos 9 \text{ deg.} = 72 \div 0.988 = 72.87$,

or 72½ in. Then, allowing for a foothold of, say 4 in. in depth and a cap-piece or wedge 3 in. thick, the required length of the post should be, say 74 in.

When the amount of the underset of a post is given in inches, as measured from the top of the post to

the perpendicular through its foot, the length of the post corresponding to the thickness of the seam may be found by taking the square root of the sum of the squares of the thickness of the seam and the given underset, expressed in inches.

Examination Questions Answered

Annual Bituminous Examinations, Pa. Foremen and Firebosses

(Selected Questions)

QUESTION—*What are a mine foreman's duties relating to the following: (a) When the mine becomes dangerous through lack of ventilation? (b) Reporting of accidents? (c) Violations of the mining laws? (d) When any workman neglects to carry out or disobeys instructions? (e) In the removal of dangers reported to him? (f) Building of stoppings?*

ANSWER—(a) The Bituminous Mine Law of Pennsylvania requires the mine foreman to notify the superintendent, in writing, whenever he considers the mine dangerous through lack of ventilation and the presence of gas or dust in portions of the mine (Art. 4, Sec. 5).

(b) The foreman must report all serious and fatal accidents, each week, to the mine inspector, specifying the nationality, age and occupation of the victims (Art. 4, Sec. 19). If the accident is fatal, he must likewise notify the coroner of the county (Art. 28, Sec. 1).

(c) The foreman must report to the district mine inspector all violations of the mining law coming to his notice (Art. 4, Sec. 23; Art. 5, Sec. 5).

(d) The foreman must suspend or discharge any workman guilty of neglect to obey or willful disobedience to his instructions and, in case, of serious accident or loss of life resulting therefrom, the foreman must give the name of the guilty party to the mine inspector of the district for prosecution according to law (Art. 4, Sec. 9).

(e) The foreman is required by law to give prompt attention to the removal of all dangers reported to him and if this is impracticable at the time, he must notify all persons in danger therefrom and see that they remain away from the place (Art. 4, Sec. 10). The foreman must see that all entrances to dangerous places are properly fenced off and danger signals posted on such fencing to warn persons to keep out (Sec. 11).

(f) The law requires the mine foreman to see that all stoppings along airways are properly built (Art. 4, Sec. 2). He must see that, in a mine generating gas and where the fireboss' station is located a mile or more from the mine entrance, all abandoned workings in the intermediate distance are completely sealed by stoppings of masonry, concrete or other incombustible material (Sec. 5). In all new mines, the stoppings between the main intake and return airways must be substantially built of masonry, concrete or other incombustible material; and the same requirement applies to the building of new stoppings or the renewal of old

stoppings in cross-entries, in mines generating gas (Art. 9, Sec. 5).

QUESTION—*Write a mine foreman's daily report that will satisfy the requirements of the mining law, assuming that at least three violations of the law existed in the mine that day, selecting your own violations.*

ANSWER—I have this day, July 23, examined the section of the mine in my charge and found the same in a safe and healthy condition, except in the following three instances: 1. In room No. 9, 2E-N entry, I found an extra charge of powder laid aside in the gob. 2. There was no timber on hand in room No. 13, 4E-N and I find no order received for timber for this room. Timber is clearly needed in the room, as the last row of props at the face is not completed. 3. Matches were found in a crosscut near a tool box a short distance from the head of main north entry. The first instance is in violation of Art. 16, Sec. 1, of the law; the second instance violates Art. 25, Rule 1; and the third instance violates Rule 32 of the same article. In each of these cases, I have taken possession of the checks of the men working in the places and shall investigate further.

QUESTION—*In non-gaseous mines, what precautions should be taken to reduce to a minimum the dangers incident to coal dust?*

ANSWER—No accumulations of dust must be allowed in any working place. Where the coal is cut by machines, the fine cuttings or "bug dust" must be loaded out in dustproof cars. If the coal is highly inflammable and is brought down by blasting, only permissible powder must be used and strict rules enforced in regard to charging and firing the shots. All places should be well watered before any shots are fired therein. Holes should be examined by competent persons before they are charged and permission is given to fire. Greater safety is assured, in the mining of a soft inflammable coal, when competent shotfirers are employed to examine, charge and fire all shots after the men have left the mine. In any case, all roads, travelingways and air-courses must be thoroughly cleaned at regular intervals. Strict rules must be made and enforced relating to blasting and all violations of the rules and requirements of the mining law suitably punished.

QUESTION—*In a mine that is generating or is likely to generate carbon dioxide (CO₂), what kind of lamps would you recommend to be used by the workmen?*

ANSWER—If the mine is not generating or liable to generate explosive gas and rightly classed as an open-light mine, open-flame lamps or torches should be used throughout the mine. Owing to the generation or liability to the generation of carbon dioxide in dangerous quantities, no carbide lamps should be permitted in sections generating that gas or in places running to the dip where the gas is liable to accumulate. It is well known that the carbide lamp may continue to burn in air that is deficient in oxygen to an extent as to be unhealthy if breathed for any length of time. The open flame lamp will show by its dim burning that the air is unfit to breathe because of the presence of blackdamp, and will thus give timely warning.

Coal Commission Investigators Report on Labor Relations in Anthracite Industry

A report dealing with labor conditions in the anthracite industry issued by the U. S. Coal Commission Aug. 8, in the main reiterates the recommendations presented by the Commission in its preliminary report of July 9, and adds others. The recommendation that the President should have the power to intervene if the opposing forces cannot come to an agreement before the expiration of the working agreement is repeated, as well as that recommending that the expiration date of the anthracite agreement shall be set sufficiently far from the renewal date of the bituminous agreement that suspension in both coal fields at one time shall not be invited. It condemns strikes and warns the union leaders against the outlaw labor disturbances, and opposes the propaganda issued by both operators and miners, characterizing it as "loose and often swashbuckling literature."

While not mentioning the check-off the Commission in its recommendations does say that "if the union is wise it will not permit the employer to take over the duty of securing members."

Dealing with "Anthracite Coal—A Vital Public Necessity" the Commission says the frequency with which labor has stopped production of anthracite, the disregard of public interest shown on occasion in the attitude of one or the other side of the parties to these controversies and the apparent impotence of the public to protect itself, has created a situation that the public considers intolerable. The demand for some sort of remedial public action is practically universal. Periodic strikes and the ever recurring menace of strikes emphasized by loose militant utterances on both sides is a condition that should be corrected.

The report reviews the organization and procedure of industrial relations from the first appearance of labor unions in the field in 1848, going more fully into conditions since 1903, and dealing particularly with the award of the Roosevelt Anthracite Coal Commission.

The operators have no organization for dealing directly or continuously with the union during the agreement period, says the report.

The more important causes of strikes and the friction which leads to strikes the report says, appear to be the following:

Attitude toward the agreement; wages; hours; irregularity of operation and attendance; attitude toward restriction of output; discharge and discipline; union membership; and administration, and then it discusses each at length.

Out of over fifty responsible operator executives interviewed, only two expressed themselves as opposed to the idea of an agreement with the union. Union officials held identical views toward the agreement and among no essential group in the union was there any advocacy of abolishing it and taking whatever the union could get without it.

From the standpoint of performance under the agreement, there are five groups of operators: A group with a liberal constructive labor policy that stands firmly for the maintenance of operator rights under the agreement but seeks to understand and win labor by constructive measures; a "peace at any price" group, who make concessions which give away essential rights of the operators under the agreement; a group of companies with little central control whose labor policy is the policy of their respective foremen; a literal constructionist group which energetically and literally supports the letter of the agreement and frequently maintains its opposition by its defensive power rather than through organized efforts to win co-operation, and lastly a group that tries to "get away with things" by whatever method possible, agreement or no agreement. These five groups, the report says, are not to be considered as mutually exclusive, one operator may at different times be found in several groups. In the union side the practice toward the agreement is in many places, in similar contrast

to their theoretical views. All the district leaders show real knowledge of the contract and of their responsibilities under it. They realize that strikes are outlawed and that it is their duty to prevent them and even to discipline locals who go out in violation of the contract. But all believe in the threat to strike and in practice they make exceptions to their condemnation of some strikes, especially of button strikes. In general, says the report, where they consider orderly method is inadequate for the relief of a real grievance, they tacitly sanction the resort to strike.

Stating that it is difficult to get comprehensive information about petty strikes and stoppages direct from the operators and the union, owing to the inadequacy of records, the Commission says the Anthracite Bureau of Information submitted a statement showing there have been sixty-eight strikes or stoppages in the period from September 1922 to March 1923 involving a total of 56,646 men with a loss of 188,514 man days.

The report shows that the anthracite industry has changed from one in which one of the foremost characteristics was its irregularity to one which compares favorably with most industries in this respect. The change is particularly marked in contrast with the lack of change in the bituminous industry, for the anthracite industry is now much more regular than the bituminous industry.

Discussing the attitude toward restriction of output, the report says that "without doubt, limitation of output does exist," that the amount varies by districts but does not seem to be an important problem in two of the three anthracite districts. The problem will not be solved, says the report, by denunciations, but through careful study by operators and union leaders of the factors which enter into a fair day's work and of the causes of undue restrictions.

Discussing union membership, the Commission says, the agreement between the anthracite operators, and the union is mutually accepted as a permanent institution and that the acceptance carries with it certain implications, the most important of which is that neither party during the life of the agreement will try to destroy the power of the other party or to assume the other's responsibilities or rights under the agreement. There is in the agreement no provision which can be interpreted to justify the union in forcing the operators to insist upon membership in the union as a condition of employment. Union miners, however, do insist upon membership and they enforce their insistence by stopping work.

"What practice should obtain in respect to union membership under a collective bargaining agreement is a debatable question," says the report, "the answer which should be arrived at by agreement or mutual accommodation between the parties. But any answer which relieves the union of responsibility for maintaining itself, and thus divorces the question of membership from the services rendered, is bound to be harmful to the union, not to mention the other interested parties. Unions like other institutions slip easily into arrogance and incapacity when existence is made too easy. Such a condition is sure sooner or later to make them a prey to attack both within and without."

The practice of the illegal strike or threat to strike to enforce union membership, the condoning of such strikes by those union officers who are obligated to prevent them, and the acquiescence in them by those against whom they are directed should be promptly and vigorously dealt with through the conciliation machinery, declares the report.

"Administration of Labor Relations" is next discussed and it is pointed out that each of the three parties to the agreement, the operator, the union, and the public, has a definite share of responsibility, and that the way in which these administrative relations are discharged makes for friction or the absence of friction.

"Such a collective bargaining agreement as exists in the anthracite industry," says the report, "cannot be maintained by police or statutory power, but can be maintained

only by the sense of responsibility and approval in each party to the agreement, backed on either side by an organization powerful enough and effective enough to command the respect of the other side and of its own members. On the union side, such an organization exists, for the union is the organization. When an operator violates the agreement, the whole weight of the union is thrown back of the effort to adjust."

There is no such organization among operators, they having no collective organization that functions from day to day to administer the operators' share of the agreement. So long as this disproportion in bargaining effectiveness exists, the process of attrition of the agreement will be likely to continue, says the report.

"Moreover," says the report, "another period of great strikes is likely to ensue corresponding to those between 1900 and 1912. This time, however, it will probably be the operators instead of the union who will be appealing to the public for fair play."

"It is our opinion the operators will not be in a position to take full advantage of their opportunity in the administration of the agreement," says the report, "unless there is, within each district an organization of the operators analogous to the union and constantly represented in labor adjustments by a competent man, or else an organization for the operators as a whole which is represented in each district by a competent labor adjuster. Such a man from the operators' side would correspond in his function to the union's district president and would be analogous, in adjustment proceedings, to the labor commissioner in some bituminous districts.

Referring to delays in the handling of dispute cases the report says there can be no question but that the long run interest of all parties is in the maintenance of the orderly method. To the public it means stability and cheaper coal. To the operators it means the limitation of direct action

and the threat of direct action. To the union it means the habits of law and order which alone permit the responsible management of a union necessary for its survival. Unnecessary delay in adjustment amounts, therefore, to playing with fire.

Discussing "Administration by the Union" the report says that a union fighting to establish itself in the face of powerful opposition is ordinarily a fighting organization pure and simple, but when it reaches the point of signing a formal agreement with employers it has ceased to be exclusively a fighting organization. It then takes over, together with definite advantages, definite responsibilities for maintaining relations on the agreed basis. The responsibility for seeing that the agreement is observed by the union must rest on the district and national officers.

That part of the machinery set up by the Roosevelt Commission may be regarded as the public's part in the administration of the agreement, says the report. A common complaint made by both operators and the union is over the delays centering around the functioning of the conciliation machinery, but the Commission declares that inadequate functioning should never afford an excuse for violation of the agreement. It then makes several recommendations concerning the work of the Conciliation Board. The best approach to a remedy for the evils of the general strike, will not, in the Commission's judgment, be found in an immediate resort to drastic prohibitory measures. The weight of opinion found among operators and union officials is that compulsory arbitration of the fundamental terms upon which a great industry shall operate, is not practicable, and offers no hope of solution of the problem of the general strike. Until measures for holding both sides to their public responsibilities have been completely exhausted it will be extremely unwise for the public to embark on more far reaching measures of regulation of labor relations.

Warriner Answers Massachusetts on Boycott

S. D. Warriner, Chairman of the General Policies Committee of the Anthracite Operators, on Aug. 11 replied to the open letter on Aug. 4 of the Joint Special Coal Investigating Committee of Massachusetts. He gives the position of the Anthracite Operators in the present situation and offers "a plain explanation of the vital issues involved and the causes leading to the present situation," which he hopes will clarify their judgment and assist them in fixing responsibility. The Committee emphasized two points, the danger of another suspension on Sept. 1 with the resultant shortage of anthracite, and the high cost of anthracite to the people of Massachusetts and the proposed boycott against the industry. Mr. Warriner in his letter takes up these matters in order, stating that one is naturally the corollary of the other. His statement follows:

"I am in accord with your view that a suspension of mining for the benefit of a special interest and to the detriment of the public is never justifiable. Let us review the facts. The strike of 1922 was ordered as a predetermined act before the old agreement had expired and before the joint committee appointed to negotiate a new agreement had even met. The operators offered arbitration. The President of the United States urged arbitration.

"The union refused both and said, 'We refused arbitration from the President of the United States notwithstanding all the pressure of the Government was back of the proposal.'"

"As soon as the major policy of the union was satisfied by the settlement of the bituminous strike, a settlement of the anthracite was made possible and promptly reached.

"The issues in the present emergency are as follows:

"1. The operators at the outset asked for a joint pledge to the public that no suspension take place on Sept. 1, upon the understanding that the new agreement should be retroactive. The United Mine Workers refused.

"2. The operators endeavored to reach an adjustment of wages and working conditions, but the United Mine Workers refused to continue negotiations, unless the operators first granted the closed shop with the check-off.

"3. The operators refused to grant the closed shop with the check-off.

"4. The operators offered to extend to April 1, 1925, the present contract with its war-peak wages and to grant certain of the union demands. This offer was not accepted though the United States Coal Commission found that present earnings admit of a reasonable standard of living.

"5. Finally, the operators offered to arbitrate all issues, not even excepting the closed shop with the check-off.

"The mine workers refused four of these propositions and the operators one, viz: the closed shop with the check-off. Our objections to this proposition are that it is fundamentally unsound in principle, and expensive to the users of anthracite in practice. Our faith in our position is shown by our willingness to arbitrate. Without a surrender of vital principles, we have taken every step that has been suggested to avoid a suspension on September 1. To have done otherwise would justly open us to your criticism.

"In our judgment arbitration represents a sound social policy in a basic industry where collective bargaining fails.

"Relative to the cost of anthracite and the use of the boycott: The United States Coal Commission pays tribute to the anthracite operators for their restraint and co-operation with public officials during the anxious situation of last winter resulting from the strike, and the care used in the distribution of coal. It is our hope that, if continuity of operation can be secured, the economic ills of which you complain will disappear. It is true that the cost of anthracite has risen, but although it has not receded from the peak, yet it is a fact that the peak of anthracite prices was never as comparatively high as many other commodities. The reports of the United States Coal Commission including its later report on retail distribution thoroughly covers the subject and invites your study. You are quite correct in saying that anthracite is not a necessity. We frankly admit that in order to retain the asset of your markets we must compete in quality and service with other fuels.

"In conclusion, let us now repeat that we have always been ready in the present emergency to extend the old agreement, to resume negotiations or to arbitrate to the end that there be no suspension of mining this year."

The Union Ultimatum: The Check-off or No Anthracite

The check-off or no anthracite, that is the ultimatum of the United Mine Workers of America to the anthracite operators and the American people, according to a statement issued this week by the anthracite operators. Extracts from the statement follow.

"They refuse the operators' offer to arbitrate any and all issues. They refuse to consider wages or working conditions until this demand is granted. They insist on what no other union demands. Negotiations are necessarily brought to an end. If government attempts to take over the mines, the same ultimatum will be outstanding, for the union grievance is against its delinquent members, and not the operators. In either case a strike for the check-off, the operators are advised, would be a violation of the Anti-Trust Laws.

"The crisis embraces more than a menace of a coal shortage, for it raises questions which go to the very heart of our concept of political and social rights. It has also a very practical bearing on the question of mine management and the cost of production. The public is entitled to be heard. To it the operators submit their reasons for refusing this demand. They believe they have no alternative.

"The check-off is a scheme for compulsory union membership whereby the employer collects union dues and assessments by deducting them from the wages of his employees. No man can be employed who is not a union member and whose wages are not so docked. The president of the union says that under this regime if a miner does not join the union he can "dig oysters in Florida." The wishes of the individual employee are not considered. All wages must be taxed to meet union requisitions in whatever amount union authorities direct.

This demand, for the enforcement of which the United Mine Workers are prepared to deprive the public of anthracite, involves a monopolistic agreement between the union and all anthracite operators, making membership in the United Mine Workers compulsory for all persons throughout the entire industry, except clerical and managerial forces.

"The demand militates against our principles of liberty, runs counter to the statements of the Presidents of the United States and Federal Administrations for over twenty years, and is in conflict with the rulings and practices of our Federal government as well as the decisions of many State courts forbidding the State and its political subdivisions to discriminate against union or non-union men.

"The United Mine Workers have been guilty of violating the anti-trust laws, and its avowed policies are aimed in that direction. It has the express authority, under its constitution, to call general strikes, which stop all commerce in coal, and, in 1922, did declare such a general strike, clearly in violation of the Federal Anti-Trust Law.

"By its recent refusal to pledge itself to the public as against another anthracite suspension, by its threat of a suspension unless it be given a monopoly, by its avowed policy of resorting to a national tie-up rather than accept the principle of arbitration in cases where collective bargaining fails to reach an agreement, by seeking arrangements with unions in other countries to prevent America from importing coal in time of emergency, this union is committed to a policy in violation of the Anti-Trust Laws and against the public interests.

"If the operators weld this union into an ironclad monopoly, charges that they encourage general strikes by that monopoly in order to create a market shortage will not lack ready utterance and belief.

"As long as the United Mine Workers avow its policy of resistance to arbitration and a resort to national strikes in case of disagreement, the operators cannot escape responsibility for such conduct, if by agreement they actively lay the foundations for more protracted coal famines.

"The anthracite operators have demonstrated their approval of collective bargaining where men voluntarily get together but cannot approve collectivism based on coercion which forces men to join an association and combine against their wills.

"This right of industrial liberty is no vague abstraction advanced for convenient purposes, but a fundamental reality, the practical importance of which is shown in many unionized industries where individual workmen have been persecuted and arbitrarily driven from their trades.

"Under the closed shop regime, what becomes of the numerous miners who are expelled for various periods up to 99 years and are fined various sums up to \$2,000? What becomes of those who wish to enter the industry and cannot pay the exorbitant initiation fees which are sometimes charged? What becomes of the various nationalities against which local unions discriminate? What becomes of the miners fined or expelled for exceeding the union limit of production?

"The records of the United Mine Workers, giving only an incomplete report of disciplinary action taken by the union in a period of sixteen weeks, shows over 600 men expelled for 99 years and over 40 men fined \$1,000. In the same period the penalties showed 1,236 members were fined a total of \$171,852 and exiled from their trade for a total of 66,784 years.

"Individual self-reliance and responsibility and individual incentive are gone and lock-step becomes the rule when all of the doors of opportunity are slammed in the faces of those who, rightly or wrongly, disagree with an organization which monopolizes the entire industry.

"Nothing that the operators do or have done is advanced as an argument in support of the demand to change this traditional policy. The union merely seeks the help of the paymaster to coerce delinquent and recalcitrant miners. It proposes to deprive the public of anthracite, because perchance some miners are slow to pay their dues. Like a jurisdictional strike, it is a quarrel within the union, with the operators and the public innocent bystanders, conscripted to play a part. The non-combatants are to suffer in this issue.

"Should monopolistic power be strengthened in an organization which has adopted the fixed policy of rejecting arbitration and preferring public suffering? Will the American people sanction more monopolistic privileges to an organization which gloats over its defiance of the Chief Executive and which, according to that executive, so largely has the country at its mercy? Have the people forgotten how, but a few years before President Wilson declared the activities of this organization to be 'not only unlawful but unjustifiable,' and exoriated it for breaking its contracts? Is there any important union in the United States so inconsiderate of the public?

"All of these matters were presented by the operators to the United States Coal Commission in a series of papers which so far as we know met no contradiction from the Union. These papers showed that the organization had no adequate sense of responsibility to the public, the operators, its members, or its contracts and that this lack of responsibility was due to a lack of legal and moral restraint and continued immunity from the consequences of its wrong-doing.

"We believe that the way out of this trouble is through it. That the American people should resolutely resist this demand coupled though it be with the threat of a nationwide tie-up. It is unwarranted by conditions in this industry. The judgment and experience of all industry are against it. In places where it has been tried the results have been disastrous and industrial warfare exists in extreme form.

"To grant it would mean an illegal combination and an abandonment of individual rights contrary to the declarations of the Presidents of the United States for over twenty years as well as a repudiation of the principles of the Roosevelt Award of 1903. It would extend the monopoly of the United Mine Workers of America, notwithstanding its practices have been under the condemnation of ex-President Wilson and President Harding, at a time when irresponsibility and a ruthless defiance of public interests dominate its policies."

What Is the Human Body Worth?

Posted in many thousand mines and workshops throughout the United States are notices, telling employees that they are protected by the provisions of their various state compensation laws. Lest any should not see and understand them, these notices often are printed in several languages. Yet in different states, there are various legal and medical interpretations of the 42 workmen's compensation laws now in force, the laws themselves having taken on widely different meanings in questions of personal injury and other accidents.

In an effort to call attention to these disagreements, which are constantly being brought before the State Legislatures and courts, the National Industrial Conference Board, New York, has just completed an exclusive report on the medical phase of workmen's compensation acts in the United States.

Every workmen's compensation case is a medical case, either actively or potentially. The Board points out that time must be lost from work because of injury to entitle a worker to compensation and this presupposes medical attention in practically all cases. The medical problem is one of the first to be encountered and one of the most important to settle in a manner satisfactory to all. At present there is so much conflict among the different states' administrative laws, and such a lack of facilities for collecting the information on this question, that the report was undertaken by the National Industrial Conference Board as a new contribution to this vital American problem.

Identical injuries are compensable in widely varying amounts in various states, and there is a similar inequality in the courts' interpretation of identical sections of the various laws. What is needed most in the administration of the workmen's compensation laws, in the opinion of the Board's experts, is greater consideration of the opinion of medical men in the administration of the laws and more uniform opinions among those concerned with their administration.

There is an increasing tendency to give due consideration to the value of adequate medical treatment in the administration of the laws. Early in their administration, the doctor's part received scant attention. In some states, even for the most serious injuries, only two weeks' medical treatment could be legally provided. "A period of experience has now elapsed," says the report, "sufficient to enable those who make the laws and those who administer them to obtain a better view of the problem. Such experience has shown the advisability of greatly increasing both the time and amount of medical service rendered, until at this time in 20 states such service may be unlimited."

The term "medical service" receives widely different interpretations in various states. Ohio and Connecticut have freed employers from liability when injured workmen took their troubles to quacks, masseuses and "doctors of medical electricity." Similarly the California State Commission refused to reimburse a worker who consulted a Chinese herb doctor. Iowa and Connecticut do not regard osteopaths as qualified to act in compensation cases, while California permits them.

States differ in the law's rulings on various surgical operations. For instance, the hand extends to the elbow in the legal opinion of Alabama, Connecticut, Delaware, Kansas, Nebraska, New York and other states, while it extends only to the wrist in Colorado, Idaho and Montana. The human foot in Colorado extends only to the ankle, but in Alabama it extends to the knee. New York takes a middle ground, merely qualifying it as some place "between the knee and the ankle."

Various state courts and commissions have answered in various ways the question: "What is the human body worth?" For example a thumb is worth \$225 in Wyoming, \$600 in Oregon, and in New York and Alabama the legal compensation for 60 weeks. Wyoming holds a human hand worth \$1,000, while its value rises to \$1,600 in Washington, \$1,900 in Oregon and 244 weeks' compensation in New York, and it is worth 104 weeks' compensation in Colorado.

Union Issue No Swashbuckling Publicity, Says Ellis Searles

Considerable resentment is displayed by Ellis Searles, editor of The United Mine Workers Journal, at the following statement in the report of Dennison, Hotchkiss and Willits on Labor Relations in the Anthracite Industry made public last week by the Coal Commission which says that "The loose and often swashbuckling literature that emerges on occasion, from the legal and publicity departments on both sides is a constant incitement to trouble," and to the mention of "irresponsible propaganda" and "misleading information."

In a communication to the Coal Commission dated Aug. 11, Ellis Searles, John Moore and Thomas Kennedy asked the commission whether this document is "merely the report of the investigators to the Commission or whether it is a statement of the Commission to the public." They asked "Has the Commission adopted the document 100 per cent as a declaration of the views of the Commission? Did the Commission authorize these investigators merely to conduct an inquiry or did the Commission delegate to these investigators authority to prepare binding conclusions on this important subject for the Commission and its members?"

The representatives of the mine workers emphatically informed the Commission that their organization does not indulge in swashbuckling literature with reference to the industry nor has it issued any irresponsible propaganda or misleading information on that subject. Since it has employed no legal talent in the preparation of its statements to the commission, the authors of this statement "anticipate that the answer will be that the operators had a legal department and that the reference was intended to apply to propaganda issued from that source." These representatives of the miners served notice on the Commission that they do not think much of this report on labor relations if it is "as accurate on other subjects as it is on this one."

The members of the Commission are reminded that they "specifically requested the United Mine Workers of America to refrain from hiring lawyers to present their case to the Commission." They state that

"The United Mine Workers have had no propaganda or publicity, neither 'swashbuckling,' 'irresponsible' nor any other kind about anthracite."

Concluding they say they have no excuses or apologies for anything that the United Mine Workers of America have said to the public in regard to either the bituminous or anthracite industry. It has kept well within the bounds of truth and propriety in this matter according to Mr. Searles.

Civil Liberty Committee Condemns Private Guards in Mine Villages

Winthrop D. Lane, whose writings on the West Virginia coal industry are well known, has just published a report, submitted to the U. S. Coal Commission on Aug. 12, which he prepared for a self-styled "Committee of Inquiry on Coal and Civil Liberties." The sponsors of the report are said to be Zachariah Chafee, Jr., Professor of Law at Harvard University; Prof. Herbert A. Miller of Oberlin College; the Rev. John A. Ryan, Director of the National Catholic Welfare Council of Washington, D. C.; the Rev. Arthur E. Holt, Social Service Secretary of the Congregational Church of Boston, and Kate Holladay Claghorn, head of the Department of Social Research of the New York School of Social Work. Jerome Davis, Assistant Professor of Sociology of Dartmouth College, assisted Mr. Lane.

The report covers conditions in parts of Pennsylvania, West Virginia and Alabama. It particularly is directed again the private guards employed by coal companies in non-union fields.

COAL AGE INDEX

THE INDEXES to COAL AGE are furnished free to all who ask for them. The index for the first half of 1923 is now ready for distribution. A copy can be had by addressing a postcard to the subscription department of COAL AGE.

Washington Moves to Prevent Anthracite Strike

On Monday the Coal Commission invited the anthracite operators and the representatives of the United Mine Workers to meet with the Commission in New York. This is the first step toward prevention of a strike in the anthracite field that has been impending since the hard coal mine workers issued their ultimatum on July 27 that negotiations could not proceed unless the operators granted forthwith the check-off. It is understood that this action follows the wishes of President Coolidge, with whom the commissioners have outlined the problem. What proposition the Commission will put before the two sides is not announced, but it is understood that the administration has made up its mind that there shall be no strike and that this will be the burden of the communication borne to the contending parties.

Events at Washington moved fast last week toward intervention by the President in the anthracite deadlock. Among the callers President Coolidge has had since he moved to Washington nearly two weeks ago, those with counsel on the hard coal situation have been the most numerous. John Hays Hammond, chairman of the U. S. Coal Commission saw the President for a short time early last week. Commissioner Smith called on Saturday, Aug. 11. Samuel Gompers has been at the executive offices twice in a week. Former Senator Calder and Representative Treadway have called, it is understood, to lay before the chief executive their views on the situation. Secretary Hoover and Commissioner Eastman of the I. C. C. talked with the President on the same subject, it is reported.

Commissioner Smith left for Gloucester, Mass., Saturday night to confer with Mr. Hammond, returning the next night. Mr. Hammond at once gave out a statement saying that the president will back the Coal Commission. His statement follows:

"I discussed the situation with the President recently and so did Dr. Smith. We found the President in accord with us and were convinced that the commission will receive his unqualified support. We have complete confidence that the situation can be handled.

"The commission believes, that neither the operators nor the miners will assume the responsibility of a lockout or strike. We realize that both are men of serious minds and realize the position they would be in before the public if a

suspension of anthracite mining occurred. Both sides realize that a suspension of operations in the anthracite mining field would afford an opportunity to the bituminous miners to dispossess them of a large part of their market for anthracite.

"Irrespective of whether there is a suspension of mining after Sept. 1, the anthracite operators realize that they must in the future meet serious competition with substitutes in their market. Recognition of this fact certainly will be a deterrent to both operators and miners in assuming responsibility for any suspension.

"Further, the commission has been busily engaged in preparing for a possible contingency by studying the sources of supply of coke and low-volatile bituminous coal. The commission feels assured that if the emergency exists, the bituminous mines will be able to supply other kinds of fuel. Not only will the use of other kinds of fuel prevent the people of Massachusetts from freezing to death this winter, but it would have considerable effect in preventing any increase in price, if not, indeed, resulting in lowering the price of anthracite in the near future.

"There is no justification whatever for anthracite dealers asking a higher price than has been obtained during the last few months, nor will the payment of higher prices assure a supply of anthracite if a suspension of mining occurs. If a strike occurs there will be no anthracite available at any price. Even if a strike should occur it would not be a protracted one, because a strike can be broken by the use of substitutes without any great hardship."

The news from the hard coal fields is to the effect that the issue of the check-off is not popular with the men. It is generally known that John Lewis chose this as an issue and issued his famous ultimatum to the conferees at Atlantic City without consultation with his confederates. The mine workers are more interested in higher wages than feeding money to the union and the trade has already discounted the final settlement as an abandonment of the check-off issue by the union and a settlement with a small increase in wages. Just how this is to come to pass is not being prophesied, but it is expected that there will be a short suspension, for effect.

Coal Commission Curtails Retail Study

The United States Coal Commission made public the following statement on Aug. 6:

"There seems to be a lack of information as to how far the United States Coal Commission has gone in the anthracite and intends to go in the bituminous industry with reference to the retailing of coal.

"To set the matter right, the Commission announces that it soon discovered that with more than 40,000 retail coal dealers in America, many of whom had their coal business complicated with other articles of merchandise, the appropriation would not permit a presentation relative to the investment, cost, margin, and profits of each of these dealers.

"The Commission has done all that it could in the way of sampling in many of the municipalities of the country the retail coal trade, and will present the result of its investigation to the country, but it has not gone and cannot go into an investigation of all the retail coal dealers of America. An investigation of such a character could not be made short of \$2,000,000, and would not be conclusive whether the citizens of a municipality were satisfied to pay the prices charged by the retailer for coal.

"Therefore, the Commission has concluded that except as to the general investigation of the subject of the retail trade, it will have done all it can when it furnishes the information as to cost at the mine. The railroad rate is easily ascertainable.

"Citizens and municipalities must do something for themselves. If they believe that they are paying to the retailer an exorbitant profit, they should supplement the work of the Commission by local investigations of the subject.

"It heartily approves all investigations that are being made to ascertain the profits of retailers in individual municipalities, the determination of profits, and any suggestions that can be made for the bettering, if needful, of conditions disclosed in the investigation of the subject."

Lehigh & Wilkes-Barre Coal Sale Approved

The sale of the Lehigh & Wilkes-Barre Coal stock by the Jersey Central to the Reynolds syndicate was approved by the United States District Court on August 8.

The Court dismisses the objections of Isaac T. and Mary T. W. Starr that the stock was sold to the Reynolds syndicate for an inadequate price and in violation of the dissolution order because there had been an agreement between the directors and Reynolds that the coal tonnage would be continued over the Jersey Central.

Judge Davis, who wrote the opinion, said in part: "Fraud has not been proved and the price was not so inadequate, if inadequate at all, as to be a badge of fraud. The directors acted in good faith and used their best judgment and in the absence of fraud the Court will not substitute its judgment for that of the directors."

The Court points out that there is a difference of less than a quarter of a million dollars between the bids of Reynolds syndicate and the Lehigh Coal & Navigation Company for a property worth at least \$32,000,000. The burden of establishing that stock was not sold in good faith or at a fair market value was not met by the objectors.

Plaintiffs in the Lehigh & Wilkes-Barre Coal case have six months in which to appeal from the decision of the Federal Court approving the sale of the Jersey Central stock to the Reynolds syndicate.

Production and the Market

Weekly Review

The middle of August may be considered to mark the turning point of this season's soft coal summer market. From the beginning of the coal year last April a steady demand has been met by a steadier supply and the spot price has continually softened. There have been few periods when soft coal production has been as uniformly high as it has been this year and the price so uniformly low. Figures published from time to time by the Geological Survey show that the demand has been quite generally distributed—no field has taken an exceptionally large share of the trade and none has suffered, in tonnage, disproportionately.

The general state of business, starting out with great promise early in the year has lived up to expectations. A slump in July from which recovery is now in progress was anticipated. It was a slump only by comparison with May and June, for as compared with other years the records were high. There is abundant indication that the fall business all around will be good. That means that consumers will need the stocks of soft coal they have been putting down this summer and that buying during the next two months will depend on what happens to price. The trade is looking forward to a period of car shortage within the next forty days that will serve the useful purpose of stiffening soft coal prices to where there is a new dollar to be had for the old on spot sales.

COKE PRODUCERS WATCHING SITUATION

For the next few weeks the market will be unsettled to the degree that a strike in the anthracite region is in prospect. If it appears that a prolonged suspension is inevitable that fact will react on the bituminous coal market, stiffening prices in the East. Coke producers are watching this situation with interest, because coke will be the substitute in greatest demand.

Production of both anthracite and bituminous coal was curtailed last week out of respect for President

Harding. Mining in all fields was generally suspended on Friday, Aug. 10, the day of the funeral at Marion, Ohio. The Geological Survey reports that during the week ended Aug. 4 anthracite production is estimated at 2,018,000 net tons.

Coal Age Index of spot prices of bituminous coal gained one point to 196 on Aug. 13, with an average price of \$2.37 at the mine.

There is practically no change in the Chicago market. Southern Illinois screenings were a trifle steadier and domestic demand grew gradually. A fairly brisk market exists for anthracite and for domestic smoke-

LAKE COAL DUMPED
(Net Tons)

	Week Ended Aug. 13	Season to Aug. 13
Cargo	1,047,197	16,019,285
Fuel	54,126	805,806
Totals	1,101,423	16,825,091

less coals in Chicago and vicinity, while the St. Louis dealers are doing practically nothing. In New England buying is almost at a standstill and consumers seem content with their present reserve stocks.

The anthracite situation continues to increase in activity. With Sept. 1 drawing closer consumers are becoming anxious about their winter coal. Although

(a) Subject to revision. (b) Revised from last report.

retail dealers have comparatively little of the domestic sizes in their yards they admit having received heavy shipments during the summer, all of which have been applied on customers' orders. The steam coals are moving in good shape. All three sizes gained strength during the past week and some heavy buying of the better grades of independent product was done.

Lake shipments continue to average near 1,000,000 net tons weekly. Reports from Ohio indicate that the congestion at the lower lake ports is gradually passing away.

Dumpings for all accounts at Hampton Roads during the week ended Aug. 9 amounted to 397,173 net tons, a decrease of 41,560 tons when compared with the previous week.

Midwestern Business Moves Slowly

Coal trading on the Chicago market continued at mediocre pace during the past week without important changes

in quotations. Southern Illinois screenings steadied a trifle so that few if any sold under \$1.50 and the average ran around \$1.65@1.75 and eastern smokeless began to get tighter. Domestic demand grows gradually. Orders are signed for shipment early in September at prevailing prices to outlying dealers, while city yards continue to buy a little here and there at rock bottom. Mine running time in Illinois and Indiana is a little improved since two weeks ago when railroad orders slumped off leaving the industry at its lowest point.

While anthracite and domestic smokeless business is fairly brisk in Chicago and vicinity, it remains quiet in St. Louis. There, dealers are doing practically nothing. There is only about 15,000 tons of anthracite in storage in St. Louis and inquiry has dropped off entirely. Neither is smokeless or coke in demand. Country trade in both steam and domestic is flat.

Illinois fields generally are quiet because of the lightness of railroad demand. Southern Illinois is centering its efforts on domestic sizes with a trifle of success. Association prices on lump are still quoted at \$4.10@4.35 with independents running down to \$3. The Du Quoin and Jackson

Coal Age Index of Spot Prices Bituminous Coal F.O.B. Mines

	1923	1922
Index	Aug. 13 196	Aug. 14 550
Weighted average price	\$2.37	\$2.36
	Aug. 6 195	July 30 197
		\$2.37
		\$6.66

This diagram shows the relative, not the actual, prices on fourteen coals, representative of nearly 90 per cent of the bituminous output of the United States weighted first with respect to the proportions each of slack, prepared and run-of-mine normally shipped, and second, with respect to the tonnage of each normally produced. The average thus obtained was compared with the average for the twelve months ended June, 1914, as 100, after the manner adopted in the report on "Prices of Coal and Coke, 1913, 1918," published by the Geological Survey and the War Industries Board.

County fields, with less business, get \$2.50@\$3.25 for lump. Mt. Olive region remains almost inactive. This region gets very little steam business.

Warm weather has practically stopped movement of everything from the Standard district. Railroad tonnage remains light. Prices are: 6-in. lump, \$2.35@\$2.50; 3x6 egg, \$2.35@\$2.50; 2-in. lump, \$2.10@\$2.35, steam nut, \$1.75@\$1.85; steam egg, \$1.85@\$2; screenings, \$1@\$1.10.

Kentucky Tries to Raise Prices

Kentucky demand looked more promising last week when several steam buyers entered the field, and when domestic demand improved, but the increase was short lived, and is claimed to have been driven out partly by an immediate price boost. Perhaps operators are not to be blamed when it is considered that average realization on West Kentucky coal is only \$1.76 and the mine run average in eastern Kentucky, \$1.85@\$1.90. The highest eastern Kentucky prices quoted were \$3.50 for prime 6-in. block, while screenings are low at 75c. a ton for non-gas, and as high as \$1.40 for best gas screenings. Mine run is \$1.75@\$2.25, good machine cut mine run selling at \$2@\$2.25, especially for gas coal.

Kentucky movement continues scattered to all sections, with no especially heavy buying from any one line of industry. Prepared coal has been in better demand and screenings

have been moving slightly better, especially gas screenings, while mine run has been rather slow. The Hazard field, in shipping large quantities of prepared coal to the Lakes has been steadily long on screenings, resulting in a low market.

Almost half the better western Kentucky mines are down, and the mushroom mines haven't been operating for some time past. A little coal is moving South, with a fair movement to Louisville, Nashville, and some movement to Michigan and the West. However, the west end of the state finds business slow.

Northwest Gets Less Coal

Duluth receipts for the season at the docks show that 6,048,593 tons of coal have been brought up this season to Aug. 1. Shipments from the docks during July exceeded the shipments in June—18,911 cars as compared to 15,157. Receipts at local docks fell off last week. Only 45 cargoes were received; eight of these were hard coal. The report of cargoes en route shows 26 cargoes in route and none of them anthracite.

The bituminous market at the Head-of-the-Lakes is irregular. The tendency is to weakness, with screenings selling lower than before this season. Prices are as follows: Youghiogheny and Hocking: lump, \$6.25 to \$6.50; run of pile, \$5 to \$5.25; screenings, \$3.75 to \$4. Splint; lump, \$6.75; run of pile, \$5.75; screenings, \$4. Kentucky: lump, \$7.50; screenings, \$4.25. Pocahontas: lump, \$10; run of pile, \$6.50; screenings, \$6.

Anthracite demand at Duluth remains strong and every chance of a short supply. Two of the companies are asking an advance of 20 cents, but this is not general.

At Milwaukee coal, more especially anthracite, is moving at a good pace. Pocahontas and the domestic grades of bituminous coal are on par with hard coal in point of demand. Business in steam coal is also picking up, the demand being mainly from remote points, however. Soft coal must move out more freely if the present volume of receipts by lake is to be maintained much longer, as the dock yards are becoming congested. The August record thus far embraces six cargoes of anthracite, aggregating 41,468 tons, and ten cargoes of soft coal, aggregating 70,420 tons, making cargo receipts since the opening of navigation 494,776 tons of anthracite, and 1,619,166 tons of soft coal.

Western Trade Improves

Coal business throughout Colorado and Utah is picking up slightly but the markets cannot be said to be lively in any particular. All Colorado bituminous domestic sizes have advanced 25c. a ton, though mine run and slack remain unchanged. Utah prices have not increased. Improved domestic demand thus far has been absorbed out of dealers' stocks and has not worked back to the mines yet. Lump moves from the mines with some readiness, but all other sizes drag. Pacific coast and Northwest business is fair for Utah producers but Idaho trade has fallen flat.

Better Outlook in Ohio

The Columbus market boasts of a healthier tone. After a month and a half of dull market things are beginning to look upward. There has been a reduction in the volume of distress coal, and the production south of the river has gotten back in the traces. Retail business is dull. Smokeless lump and egg is being quoted at \$10.50@\$11, run-of-mine \$7.50, bituminous lump, \$7.75@\$8.25 and slack, \$5. West Virginia 2-in. lump is quoted the same as last week, \$2.50@\$2.75 and southeastern Kentucky 2-in. lump at \$2.75, as compared with \$2.50@\$2.75 last week.

Householders in Central Ohio are showing a disposition to come into the market, which has tended to put a little more life into the retail situation. Replenishing the retail dealers' supplies has been fairly brisk, with Pocahontas and Splints the most popular grades. Steam coals are rather quiet as there is still some distress coal to be had at low prices, but the tonnage is being gradually reduced. Mines continue to close. While there is apparent little hope shown for any great change in the steam trade situation some believe there will be a spurt about Sept. 1.

There has been no change in the steam trade at Cleveland.

Consumers buy coal as they need it, and no indication has been shown to do any storing. The retail business shows some increased activity, operators reporting inquiries from that source as more numerous.

The market at Pittsburgh shows improvement, with slightly better demand and prices for steam grades and gas slack. Heavier production by the larger mines has more than balanced the closing of the small mines during the past four months. The market has preserved the improved condition of a week ago. Car loadings in the Central Pennsylvania District during the week ended Aug. 5 amounted to 17,881 cars, as compared with 17,892 cars the previous week. Production in Virginia picked up slightly, "no market" losses not being so heavy.

Dullness Continues in New England

In New England there are few developments of interest. Inquiry remains much the same, with buying power practically removed from the market. Textile and other manufacturers are content with present reserves and in view of the large amount of over-buying in the spring it is likely they will be slow entering the market in the fall. Midsummer dullness continues undiminished so far as steam coal is concerned. A few stray cargoes are being purchased, especially for out-of-the-way points, but the aggregate tonnage is small and has no effect on prices.

The Hampton Roads shippers report a better outlook for the balance of August than was anticipated. More coal is dumped for coastwise movement and there are enough inquiries off-shore to keep the range of quotations reasonably steady. Navy Standard grades are being held at \$5.50@ \$5.75 per gross ton f.o.b. vessel, but occasionally there are sales at 15@25c. less than the minimum open price.

All-rail from Central Pennsylvania movement to New England shows a light average. Mining has fallen off with slack inquiry and even producers of most favorably regarded coals are again canvassing for late August business. Prices were established on a minimum basis, costs considered, at the beginning of summer and since then there has been no opening for any advance. New England is still unresponsive to substitutes for anthracite. Receipts of the latter are large under the conditions and here there seems increasing confidence that somehow in the anthracite region a working arrangement will be patched up.

The flow of steam grades via the New York and Philadelphia piers, especially via the latter, has shown a steady decline since August 1. There is now practically no anxiety over transportation conditions in December and January and most of the utilities in this territory have as large stocks as it has ever been their practice to carry.

Seaboard Market Quiet

Bituminous market conditions along the Atlantic seaboard remain dull, although there is a trifle better feeling. At New York inquiries were numerous, but there was scarcely any increased activity. At Philadelphia the better feeling was attributed to the unrest in the anthracite situation. More inquiries were received, and it is apparent that consumers are reaching the conclusion that it is well to have some coal on hand. Offerings of screened and sized coals are becoming more frequent. Inquiries for coke for domestic use are gradually increasing. Large consumers in Baltimore seem to have decided to buy in the open market instead of entering into contracts. The prospects at Birmingham are brighter. A better inquiry is reported and

more interest is being taken in the contract situation, some extending from six to eight months having been reported as closed within the past two weeks. Commercial mines report a shortage of equipment for loading, especially mines on the Southern Ry. The L. & N. is also unable to furnish the necessary number of cars to its independent operations.

Export demand remains quiet. There were a few charters closed for Italian and Dutch ports, and a similar activity prevailed with regards to South America. There was also a little business to the St. Lawrence and Cape Breton. During the first ten days of August 12,958 tons of cargo and bunker coal was loaded at Baltimore in three vessels.

Demand for Anthracite Strong

While there is a feeling with consumers that there will be no strike in the anthracite fields this fall, the demand for the domestic coals continues strong and those users who have not yet received their winter supply are just as insistent as ever about obtaining it. The steam sizes are becoming stronger. While reports are occasionally heard at New York of some offerings of independent domestic coals as high as \$14 for straight lots of stove coal the general market is about 50c. lower, and there is not a great deal of coal at that price being received in that market. At Philadelphia quotations as high as \$14.25 for egg, stove and chestnut have been heard. Some shippers are not willing to accept orders for August delivery, claiming to be sold up to the end of the month. The steam coal demand has tightened, with independent product sold up to the end of the month. Consumers at Baltimore want their winter supply of domestic coals and are urging the dealers for deliveries.

The demand for heating coke is gaining strength, the increase coming from regular customers as well as from winter consumers, chiefly factories, who usually begin stocking up in July. There has been considerable inquiry from dealers in domestic fuels. The coke trade does not expect an anthracite suspension and do not attribute the increased demand to that source. Output of beehive coke production during the week ended Aug. 4 is estimated at 345,000 net tons, by the Geological Survey, a decrease of 16,000 tons from the previous week.

Virginian Asks Case Be Reopened

Declaring that the recent decision of the Interstate Commerce Commission refusing permission to the Virginian Railway Company to extend its Guyon branch in West Virginia to open up new coal mines amounted in effect to confiscation of property without due process of law and therefore was unconstitutional, the Virginian Company filed a petition to reopen the case August 11.

The decision of the Interstate Commerce Commission was based upon the assertion by the Commission that the bituminous coal industry is over-developed and that the Virginian Railway last year was not able to supply sufficient cars to the mines already in operation along its lines.

Foreign Market And Export News

British Coal Production Has Upward Turn; Welsh Market Stronger

British coal production increased 512,000 tons during the week ended July 28, as compared with the previous week, says a cable to *Coal Age*. The output for the week was 5,112,000 tons, while for the previous week it was 4,600,000 tons, and is the first increase in a couple of months.

A dispatch to a newspaper says that a large order has been placed by a gas company for Durham coal, with Kanawha gas coal as an optional substitute.

The Welsh coal market continues steady with a slight tendency to improve. Foreign buyers have been holding off because of the difficulties created in connection with the Ruhr and the condition of foreign exchanges.

Moderate business continues with France, and a considerable amount of other business is in hand, but shipment is held up until exchange rates make payment more favorable to buyers. Italian business is quiet, but there is a slight improvement in the demand from Germany and Belgium.

Orders for Wales include 20,000 tons of Monmouthshire large for the Palestine Railways; 50,000 tons (not described) for the Brazilian Railways; and 30,000 tons of large and small steams for the French State Railways.

The Newcastle market continues uncertain. There is still considerable delay in tonnage arrivals, owing to the effects of the dockers' strike, and coal which has accumulated can be bought at concessions in price.

Ruhr Coal and Coke Shipments

There were delivered to France and Luxemburg from Ruhr during June 219,500 tons of coal, 226,400 tons of coke and 19,400 tons of lignite patent fuel, while up to July 25 there had been received from the same source 52,800 tons of coal, 59,700 tons of coke and 2,500 tons of patent fuel.

Imports of coal during June was 2,561,000 tons, as compared with 2,193,300 tons in May, of which 177,000 tons came from the United States. Coal imports from the United States in May

amounted to 102,200 tons. Total exports in June amounted to 158,000 tons, as compared with 232,100 tons in May.

There were 378,000 tons of coke imported by France in June, as compared with 382,000 tons in May, of which 33,000 tons came from the United States, as compared with 76,700 tons in May. Exports of coke in June amounted to 47,000 tons in June, as compared with 33,400 tons in May.

Stimulating French Coke Production

Efforts made by the French coke industry to increase its production have been limited by the inability to count upon an assured market, and as a result the extension of the French coke industry and even the recovery of the production lost reached in 1912 has been impossible, says Commercial Attache Chester Lloyd, in a report to the Department of Commerce, at Washington. French cokeries produced about 3,660,000 tons in 1912 and only 2,400,000 in 1922, whereas coke consumption in France increased from 6,000,000 tons

before the war to almost 7,000,000 in 1922.

In order to relieve these conditions an agreement has been made between the metallurgical industry and the French cokeries by which for five years from April 1, 1923, the production of the latter will be taken over at conventional prices. The coal companies owning the chief cokeries undertake to deliver to the metallurgical companies which take part in the agreement tonnages of metallurgical coke at least equal to those which the metallurgical companies have recently been taking.

The metallurgical companies on their side agree to take all the coke which the coal companies may produce in their cokeries at a basis price of 107 francs f.o.b. factory, this price to be varied according to the wage rates paid for labor and to be based on coke analyzing 82 to 84 per cent carbon. Metallurgical and coke manufacturing interests hope that from the stability of the market thus created in France coke production may show a very appreciable increase which will carry the totals well beyond those reached under pre-war conditions.

Hampton Roads Market Firm

The market at Hampton Roads continued firm last week, in spite of lack of demand. Dumpings for the week ended Aug. 9 were lower than during the previous week and prices also showed a decline. Several cargoes to foreign countries were reported for early shipment, but they were not sufficiently large enough to change the market's tone. On Aug. 10 it was said vessels were waiting to load about 35,000 tons of coal.

News Items From Field and Trade

CONNECTICUT

Stanley H. Bullard, president of the Connecticut Chamber of Commerce, in an address before the members of the State Association of Secretaries of Chambers of Commerce at Seaside Park recently, urged support of the state chamber's investigation of the coal situation. The purpose of the special committee, Mr. Bullard declared, will be to learn the price of coal at the mines, railroad rates, quality of coal, prices asked by merchants in various places, comparison of prices with other parts of the state, different ways in which to utilize the family coal supply and the best way to burn the different kinds of coal.

A survey of the coal requirements for Fairfield County will be made by the Fairfield County sub-committee of the Federated American Engineering Society, in conjunction with other committees throughout the country. The object of the survey is to ascertain the demand for the homes and for the country's industries, the favorable time to transport coal from the mines to Bridgeport and vicinity, prices at the coal mine and prices charged by dealers and by operators to manufacturers, and much other data.

GEORGIA

The General Council of Atlanta has rescinded a resolution adopted some time ago establishing municipal coal yards. Some speakers denounced it as socialistic and unfair competition for legitimate business.

ILLINOIS

The contract to supply coal for the city of Moline, has been awarded to the W. G. Block Co. at a price of \$1.75 f.o.b. mine, which is 50c. a ton less than in May. The maximum freight rate is fixed at \$1.66 a ton.

The annual picnic of the employees of the Springfield, and Taylorville, divisions of the Peabody Coal Co. was attended by 1,500 persons. It was held in Lincoln Park, Springfield. A score of officials of the company attended. A company band played during the day and a baseball game by teams representing the two divisions proved of interest, the Springfield team winning by a score of 3 to 1. The first-aid teams competed, being judged on their ability to rescue men from common mine accidents and in giving emergency treatment to injured persons. J. F. Monahan, manager of the Springfield division, was master of ceremonies.

Four drilling outfits are at work on leases east of Johnson City, owned by the Madison Coal Corporation, which is the name of the mining company controlled by the Illinois Central R.R. for fuel coal. Twenty-four holes are to go down. Some of them are to be 2,500 ft. deep. There are 13,000 acres in the tract through which the proposed I.C. cut-off will run. Indications point to the probable sinking of at least two mines in the near future on this tract.

What are said to be the largest rotary dumps in the world are now being manufactured at the Chicago plant of the Ramsay Dump & Machine Co. for the Lemont mines of the H. C. Frick Coal Co. There are two of these dumps with a capacity of 35 cars each. The Ramsay dump was invented and placed in use about 23 years ago by Erskine Ramsay, of Birmingham, Ala., vice-president and chief engineer of the Pratt Consolidated Coal Co., industrial leader and capitalist, and these dumps are now in use throughout the United States and in some foreign countries in the handling of coal, ore and other minerals.

Mine No. 15 of the Old Ben Coal Corporation at Weaver, near Marion, has resumed operation after a shutdown of several weeks. During the time the mine was idle, all boilers and other equipment of the steam plant were dismantled and taken out with the exception of one boiler to be used during the winter for heating. In place of the steam hoist, electrical hoisting machinery has been installed and will be used exclusively in the future at the plant. The change will make a marked difference in the number of men employed on top at the

plant as well as a large decrease in the tonnage consumed by the steam plant. Practically all machinery about the mine, both top and bottom, will be electrically operated under the new system.

A huge lump of coal is now owned by the Bell & Zoller Coal Co. at Zeigler. The lump is 11 feet long, 5 feet high and 4 feet and 8 inches wide and weighs 11 tons 1,500 lbs.

The Miller Coal Co. of Marion, capital stock of \$15,000, has filed articles of incorporation at Springfield. The company will take over and operate the Ingram mine near Marion. Many improvements will be made at the plant, including complete electrical installations and electrical coal cutting and hauling machinery. The incorporators of the new firm are: George B. Dodds, Carrier Mills, manager; Dr. J. B. Miller, Mrs. Ima Miller and W. T. Harris, all of Marion. Main offices of the new company will be maintained at Marion.

The Shed Coal Co. of Marion has incorporated for \$100,000 and will mine coal near Marion. Following are the officers of the new company: E. E. Allen, H. J. Faust and P. H. Williams.

The Caloric Coal Co. has purchased 82 acres of coal land immediately adjoining its strip mine property near Herrin. The purchase of the land has nothing whatever to do with the sale of its mine to the U. M. W. of A.

The Kortkamp mine of the Indiana & Illinois Coal Corporation at Kortkamp has resumed operations after an idleness since May 1. Five hundred men have gone back to work. The West End Coal Company's mine near Springfield is also in operation, having been idle since May 1, giving employment to 350 miners.

Work has been resumed at the old Pryce mine near Coal Valley. In times past this was one of the more prosperous mining communities and this mine was a factor.

Plans are under way to open up a large stripping field between Lewistown and Cuba along the lines of the Burlington. The Tiger Mining Co., the principal operator, is beginning to ship in machinery.

Five drillings on the William Butler and J. D. Smith farms, north of Knoxville, have revealed the presence of a good vein of coal at 250 ft.

The office of the Monmouth Coal Co. at Brereton was destroyed by fire recently with loss of \$3,000.

The mine of the O'Fallon Coal Co. has resumed work after being idle for three weeks or more.

Development of the strip mine of the Hartshorn interests at Elkhaville is increasing daily and by cold weather the company expects to have a fair size daily output. The outfit is one of the largest in the state.

Fred W. Price, who resigned as superintendent of the Tamaroa-Little Muddy Coal Co., at Tamaroa, several months ago, on account of ill health, has again resumed his duties in that capacity.

J. C. Bloomfield, who for a number of years was with C. H. Hart & Co., Chicago contractors, has now taken charge of the Industrial Works Chicago office at 1051 McCormick Bldg., handling the sale of industrial equipment in that territory.

The name of the Electric Steel Co., Chicago, was changed to Nugent Steel Castings Co. at a stockholders' meeting held in Chicago, May 28. There is no change of management, ownership, or personnel. Charles Piez is president of the company, W. J. Nugent is vice-president and general manager; Prentiss L. Coonley is treasurer, and C. A. MacDonald is secretary.

Damages to the extent of \$175,000 are asked in a suit filed against Williamson County by the Southern Illinois Coal Co. A claim for a similar amount filed by the same company several months ago was not allowed by the county board of supervisors. The suit is the result of the union rioting in June, 1922, when 22 men were killed and a score or more injured.

The Consolidated Coal Co. of St. Louis, has closed Mine No. 8, near Herrin, for a few weeks, repairing the tippie. The Wisconsin Bridge & Iron Co. of Milwaukee, Wis., is doing the work.

The Freeman Coal Co. of Herrin, has removed its offices from the Walker Building in that city to the mine east of town. The Burton Coal Co. Chicago, now occupies the rooms formerly used by the Freeman Coal Co. E. Skaggs is in charge of the office.

INDIANA

Miami No. 10 mine team which recently won the cup offered by the Indiana Operators' Association for the best work at the State meet held recently at Sullivan, was instructed by Matthew Kerr, instructor for the Clinton Joseph A. Holmes Association, of Clinton. Kerr has been interested in first aid work since 1912. He was one of the original members of the Clinton first-aid workers and was a member of the team that won the cup for the best mine rescue work at the national meet at Terre Haute in 1914. He was captain of the Dering Mine No. 6 team that won first honors at the Indiana State meet in 1920, took the team to the national meet held at Denver the same year and scored high, and the following year took a winning team to the national meet at St. Louis.

MIAMI NO. 10 TEAM, INDIANA OPERATORS' CUP

About seventy-five coal men were guests of the **Cosgrove Coal Corporation** of Pennsylvania and Illinois, at a conference of owners and controllers of mines operating under the company, the conference being held at West Baden, Ind., sixty miles north of Louisville, Ky., July 29 to 31. There were short business sessions on Monday and Tuesday mornings, the rest of the time being given over to golf and recreation.

C. L. Rader, of the Rader Coal Co., with offices in the Traction Terminal Building, Indianapolis, has been appointed receiver for the **Queen Coal & Mining Co.** He succeeded J. B. Sample, a banker, of Lafayette, who was appointed receiver last year. The Queen Coal & Mining Co. controls two of the largest Fourth Vein mines in the state, according to Mr. Rader. They are located in Jasonville, in Greene County. Offices of the company are in Lafayette. The appointment of a receiver last year was due largely to strikes and dull markets. Assets of the company are said to be between \$750,000 and \$1,000,000 and liabilities approximately \$150,000.

IOWA

An 8-ft. vein of coal has been found on the Nussbaum farm one and one-half miles south of Lacona, Ia. The vein is half a mile from the Burlington railroad and switch connections will be made.

The new mine of the **Pearson Coal Co.** recently opened near Clarinda is one of the modern shafts in that section of Iowa. The vein is 22 inches thick. A modern tippie 40 feet high, electrically equipped throughout, is an innovation there. This mine has a capacity now of 200 tons per day and on account of the good working conditions and modern equipment will rapidly increase its tonnage. The old Pearson mine has been abandoned. Mine No. 4, one of the old-time small tonnage type, is still in operation.

KANSAS

A recent purchase was that of the **Hamaker coal holdings**, comprising about 420 acres, west of Scranton, by the Capital Coal & Mining Co., of Topeka, a new concern with a capital of \$200,000. The price paid for the Scranton property is reported to have been \$125,000. Development will soon begin and the installation of modern, electrically operated equipment is being planned.

KENTUCKY

Vaiden M. Lackey, secretary-treasurer of the **Dixie Fuel Co.**, and holding the same position with the Douglas and Phoenix mining companies, of Louisville, operating West Kentucky mines, was married at Nashville, Tenn., on July 31, to Miss Mildred Adel Harrington.

The **Rowe Coal Co.**, Madisonville, Hopkins County, has been incorporated by Lee S. Rowe, H. D. Rutledge and David Kirkwood, all of Madisonville.

At Mannington, in the western Kentucky field, the **Jericho Coal Co.**, capital \$50,000, has been chartered by W. Mineter, of Memphis, Tenn., Dolph Woodruff, and B. D. Williams, Jr., of Mannington.

A threatened tie-up in river shipping of coal by low water has been averted by a couple of excellent rains over the past week, and the August 1 river stage is reported as the best that has been known in years. In most seasons there is very little coal moved over the midsummer season, but this has been an unusually rainy year.

W. B. Gathright, of the St. Bernard Mining Co., has returned to the Louisville office after visiting a number of retailers down in the state.

MARYLAND

New coal developments have been started at Barton by James J. McDonald and Arthur P. Hoffa. A survey of the mining property has disclosed an excellent vein of Bakertown seam coal. Mr. McDonald and Mr. Hoffa are also interested in another new development at Phoenix, near Barton.

MASSACHUSETTS

The Joint Special Coal Investigating Committee of Massachusetts has sent a communication to the anthracite operators and miners, serving notice that in the event of another strike on Sept. 1 it proposes to inaugurate and vigorously push a permanent boycott against the use of anthracite and that it will seek the aid of other anthracite-consuming states by placing its plans for the boycott before a conference of the governors of the New England states, which is to be held in Boston on Aug. 23.

MINNESOTA

The **Village of Hibbing** has purchased 10,000 tons of Elkhorn screenings for public utility use at a price of \$5.20.

The dock interests have asked a delay of ninety days in which to put in their answers to the charges made before the **Federal Trade Commission** relating to their alleged attempts at a monopoly and operation in restraint of trade. The hearings strung along for about seven weeks, from about June 1 to the close of July, with evidence introduced to support the charges, in the shape of endless documents, letters, circulars, minutes and a considerable amount of verbal testimony. Coal history from the dawn of creation was submitted to sustain the charges made. A ten days' continuance was granted on the ground that an attorney for the defense was ill, and this has been followed with a request for continuance for ninety days.

The **B. & B. Fuel Co.**, 1601 Washington Avenue North, Minneapolis, has a record for being burglarized. The fifteenth robbery in six years, the other night netted \$100.

MISSOURI

The inroads made by electricity on the steam coal business in St. Louis is well illustrated in the matter of the ice plants in St. Louis. The **Polar Wave Ice & Fuel Co.** has in the last few years electrically equipped and is operating all of its ice plants with current from the Union Electric Light & Power Co. and part of this current comes from Keokuk and is generated by water. There are five companies in St. Louis engaged in the refrigeration ice business. In the plants of these five the current aggregates 11,560 horse power. The **Polar Wave** has eight ice plants with an average of 600 kw. to each plant. The **Merchants Ice & Fuel Co.** has two plants. The **Mound City Ice & Cold Storage Co.** has one plant. The **St. Louis Refrigerating & Cold Storage Co.** has one and the **Federal Cold Storage Co.** has a new plant. With the exception of the last two companies and the **Mound City Ice & Cold Storage Co.** all of these plants were formerly supplied with coal from coal companies' yards, using screenings principally.

MONTANA

The **Chicago & Northwestern Ry.** is about to build a line from Belle Fourche, S. D., to Miles City, tapping a rich coal field.

The U. S. Land Office at Billings was directed July 18 by the Secretary of the Interior to offer for lease a tract of 1,600 acres of public coal land in Montana. The land is in Carbon County in the vicinity of Joliet and is underlain by the Bridger seam. Lease for this tract will be at a government royalty of 10c. per ton for coal mined, a minimum investment in mining operations of \$50,000 during the first three years of the lease, and a minimum production of 20,000 tons of coal a year beginning with the fourth year of the lease.

NEW YORK

Thomas MacLachlan has been appointed manager of the New York office of the **Vulcan Iron Works**, of Wilkes-Barre, Pa. Mr. MacLachlan succeeds M. E. Davis, who has gone into other lines of work.

Samuel B. Flagg has been made special representative in New York of the **Sanford Riley Stoker Co.**, of Worcester, Mass. Mr. Flagg for several years was engaged in fuel studies for the U. S. Bureau of Mines. For the past six years he has been a fuel specialist on the staff of the **Electric Bond & Share Co.**

OHIO

Glen White Coal & Lumber Co., of Baltimore, have removed their offices from 209-211 Union Trust Building to 10 East Pleasant Street.

As a result of extensive investigations of the coal field around Wellston, a vein of No. 4 coal has been found 600 feet beneath the surface.

A first-aid and mine-rescue training school has been opened at Marion. Organization and instruction is under the supervision of Thos. Rogers, of Herrin, of the state mine-rescue and first-aid department. The school is open to all who care to attend, the course is free and certificates will be issued to all who complete the course.

Among the operating and jobbing concerns chartered in Ohio recently are the **Turkey Foot Coal Co.**, Canton; capital, \$10,000; to mine and sell coal; by Ida Weisend, James E. West, J. F. Dougherty,

L. A. Brill and Marie Bedard. The **Brenn-witt Coal & Coke Co.**, of Toledo, capital \$25,000, to produce and sell coal and coke, by Lee J. Brenneman, Albert H. Miller, A. E. Wittwer, James P. Schrider and Daniel J. O'Rourke. The **Alliance Acme Coal Co.**, Alliance; capital, \$20,000; to mine and sell coal, by T. C. Tessem, R. A. Evans, E. M. Evans, M. H. Tessem and G. R. White. The **Northeast Coal Co.**, Youngstown, capital, 5,000 shares, no par value designated, to mine and sell coal, by Charles F. Smith, J. P. Huxley, T. Lamar Jackson, Charles J. Jackson and Norman A. Emery. **Everybody's Coal & Iron Co.**, Dayton; capital, \$10,000; to buy and deal in coal; by Joseph Sandmel, Joseph Tandy, Anna Sandmel, William Tandy and Kate Tandy.

The **Carrollton Coal Co.**, of Canton, has been chartered with a capital of \$50,000 to operate in the Upper field by S. D. Valley, T. F. Kuckelman, Abel Lourdot, Arthur L. Nebel and Edward Reinhart.

The **Case Coal & Mining Co.**, of Akron, has been incorporated for \$60,000 by H. R. Stevenson, C. Lloyd Case, W. E. Davis, Thomas Williams and W. L. Case.

PENNSYLVANIA

The **Henderson Coal Co.** of Pittsburgh, Pa., has contracted with the **Roberts & Schaefer Co.** for the installation of a new Marcus screen at its tippie at Henderson.

The appraised valuation of the property and plants of the **American Coke Corporation** fixed by the Board of Appraisers appointed by the U. S. Court for western Pennsylvania has been placed at \$2,161,000, with indebtedness of about \$3,000,000.

A state charter was issued at Harrisburg recently for the **Underhill Coal Mining Co.**, of Tyler, Clearfield County, the purpose of which is mining, buying, selling and dealing in coal. The company's capital stock is \$25,000, and Donato DiSalva, Tyler, is treasurer. He, John Palumbo and Anna Palumbo, of Force, are the incorporators.

The **Phoenix Park colliery** of the Philadelphia & Reading Coal & Iron Co. has resumed operations after several weeks' idleness, due to a dispute between the miners and the company as to the duties of men who were transferred from town locals to colliery locals.

John V. Berry, well known through his work throughout Pennsylvania and other states with the U. S. Bureau of Mines, has been appointed chief of the first-aid and mine-rescue division of the **Bethlehem Mines Corp.**, with headquarters at Johnstown.

Sinking a shaft for the **Springfield Coal Mining Co.** on the David Black farm in Cambria township, Cambria County, near Ebensburg, is well under way and the company will start shipping fuel this fall. The new mine will have an outlet over the Pennsylvania and the Cambria & Indiana railroads. New houses are being erected for the accommodation of miners.

The first meeting of the New State Workmen's Compensation Board was held at Harrisburg, July 10. Paul W. Houck, acting chairman since the resignation of Harry A. Mackey, presided and the two new members, Chairman T. Henry Walnut, Philadelphia, and John L. Morrison, Greenville, watched the proceedings. Fifteen cases were heard at the initial session.

James J. McNulty, who is Burgess of Throop, has been appointed claim agent for the **Price-Fancoast Coal Co.**, of Throop, and the **West End Coal Co.**, of Mocanaqua with office at Scranton, and his duties are to settle all workmen's compensation cases originating at the collieries of the companies and to adjust damages done to houses or other real estate by mining operations.

Thomas Kennedy, president of District No. 7, United Mine Workers of America, upon solicitation of a committee of the Non Partisan League, has been urged by his most intimate friends to become a candidate for the office of sheriff of Luzerne county. Although Mr. Kennedy has not committed himself upon the matter, it is generally believed that he will throw his hat into the ring in the scramble for the office.

Thomas McCaffrey, of Brier Hill, Fayette County, who recently resigned as president of the **Brier Hill Coke Co.**, a subsidiary of the **Brier Hill Steel Co.**, when that company was absorbed by the **Youngstown Sheet & Tube Co.**, has removed his place of residence to Pittsburgh, where he has entered the iron and steel sales business.

Negotiations are on, and the price is said to be satisfactory, between the **Pennsylvania Coal & Coke Corporation** and the owners of the coal underlying the **Newton Pryce** farm between Ebensburg and Car-

rolltown, Cambria County, for the purchase of the valuable site. This tract will be developed on a large scale by the corporation seeking it.

William H. Blight of Elmira, N. Y., has recently been elected president of the **Eagle Mining Corporation**, of Ridgeway.

Gus Carlson, **Edward Gustenon** and **Emil Johnson**, miners, are dead as a result of a cloudburst which struck Plumville July 30. The three men were working in the mine of the Sottern-Rinn Company when the cloudburst caused water to run into the shaft after doing great damage to the town itself. A score of other men were employed in the mine, but escaped the rush of the water.

John B. T. Jones has been appointed assistant general manager of the **Hudson Coal Company**, with headquarters in Scranton. For the last three years he has been superintendent of Pine Ridge, Delaware and Laurel Run collieries of that company. Mr. Jones is succeeded by E. B. Wilhain, formerly superintendent of Gravity Slope colliery at Archbald. Mr. Jones has been with the Hudson Coal Company since boyhood. In 1890 he started as a messenger boy at Scranton. He was sent to the Wilkes-Barre division in 1910 as mining engineer. He was appointed superintendent of the Lafin colliery in 1916 and four years later was given charge of the Pine Ridge, Delaware and Laurel Run operations.

Hudson Coal Co. has purchased a several acre tract of land in Throop, formerly owned by the Price-Pancoast Coal Company. The land is improved with several dwellings and was sold for \$20,000. The Hudson Coal Company previously owned the coal under the land in question.

Payment of the Hostetter-Connellsville Coke Company bonds was made on Aug. 1, amounting to \$80,000. The original issue of \$1,500,000 was sold Feb. 1, 1892. The bonds were issued to become due Feb. 1, 1942, but a sinking fund was provided for the redemption before maturity, being made up by setting aside 10 cents per ton on each ton of coal mined and 15 cents per ton on each ton of coke manufactured.

The Hockensmith Wheel & Mine Car Co., Penn., announces that F. C. Hockensmith, one of the founders and for many years the president of the company, is now chairman of the board of directors. He is succeeded by W. D. Hockensmith, formerly vice-president, whose title is now president and general manager. C. L. Herbster, formerly second vice-president, is now vice-president. D. M. Wagoner, who with F. C. Hockensmith, founded the company, remains treasurer, and F. L. Shallenberger continues to be secretary. W. K. W. Hansen retains his position as general superintendent, while a new position, that of assistant plant manager, has been created for G. E. Ogilvie, who was formerly assistant general superintendent.

Sixteen hundred acres in the Blue Lick field in Somerset County recently acquired by Rowe Brothers, prominent Myersdale operators, is being prepared for operation. The tract contains high grade Pool 9 coal lying along Blue Lick Creek, near Myersdale. This is the largest undeveloped coal tract in southern Somerset County. Four miles of railroad track is being laid and connections will be made with both the Western Maryland and the Baltimore & Ohio railroads. The land was acquired from Daniel B. Zimmerman by Frederick Rowe, Jr., and Frederick Rowe, Sr., will become the directing head.

Uehling Instrument Co., Paterson, N. J., manufacturers of CO₂ recorders and draft and vacuum gages, have named the **Amsler-Morton Co.**, Fulton Building, Pittsburgh, as agents for western Pennsylvania and **John A. MacDowell**, 2039 Railway Exchange Building, St. Louis, Mo. for eastern Missouri and southern Illinois. **H. R. N. Johnson**, who formerly represented the Uehling Instrument Co. in Minnesota and the Dakotas, has joined the W. P. Nevins Co., 120 South Ninth Street, Minneapolis, Minn., which company is now the official Uehling representative in that territory.

In order to provide more adequate facilities for an increasing volume of business in the Pittsburgh district, the **Pennsylvania Crusher Co.** recently moved its offices to more adequate quarters in the Oliver Building, where operations will be continued under the management of **H. M. Hallett**, as District Manager. The business of the Pittsburgh office is largely concerned with coal-preparation machinery for mines, byproduct coke plants, central stations and industrial power plants, and with heavy duty primary and secondary crushers for large cement and lime plants.

Hugh P. Mullen, of Johnstown, was named receiver for the **Heshbon Coal Min-**

ing Co. on June 4 by C. Randolph Myers, of Ebensburg, referee in bankruptcy. The Heshbon company's schedule shows total assets of \$87,000, made up of \$57,000 worth of real estate and \$30,000 in stock in trade, including tipples, mining cars, a leasehold and various operating equipment. Liabilities aggregate \$122,262.12 mostly in secured claims. **Fred G. Beiter**, of Johnstown, is secretary and treasurer of the concern. The company owns and has been operating about 380 acres of coal in West Wheatfield township, Indiana County.

The American Briquet Co. is reported to have started construction on a new plant to make briquets from anthracite culm at Lykens. It will cost \$350,000 and be ready for operation in September. It will be of steel and concrete construction, and will replace the company's property destroyed by fire several months ago. Fifty-five men will be employed, and the plant will turn out 10,000 tons of briquets monthly. **A. D. Parker**, of Westchester is president of the company, which disposed of its products mainly in New England and states adjacent to Pennsylvania. The company purchases its culm from the **Susquehanna Collieries Co.**

Sale of the Lehigh & Wilkes-Barre coal stock by the directors of the Central Railroad of New Jersey to the Jackson E. Reynolds Syndicate of New York, under the Reading segregation decree, for \$32,490,980, was approved Aug. 8 by the Federal District Court at Philadelphia. Objections to the sale by Isaac T. and Mary T. W. Starr, minority stockholders of the Jersey Central, were dismissed by the court, which held that they had failed to prove allegations that the stock was sold to the Reynolds Syndicate at an inadequate price.

Plans of the United Mine Workers for a demonstration in Scranton on Mitchell Day, October 29, at the unveiling of the memorial to **John Mitchell**, have been temporarily abandoned. The monument will not be completed by that time. The original plans for the monument called for two sculptors to work on the memorial at the same time, but because of the desire for absolute uniformity throughout, only one artist is to do the work. Under this arrangement the work will not be completed before the middle of December. Officers of the miners have not decided whether they will hold the celebration in December or postpone it until April 1 next, the anniversary of the eight-hour day.

Prof. Homer G. Turner, of Lehigh University, whose tests showing the structure of anthracite have been noted in *Coal Age*, will make a trip this summer through the Pennsylvania anthracite fields from which new scientific results are expected. Results obtained by applying the Turner method to specimens found on the trip may enable coal operators to determine, with a few minutes' work, the particular coal bed from which a sample has been obtained, without necessity of long and expensive drilling operations. Professor Turner also will collect samples of coal from various beds in the different fields with the hope that he may show development of plant life during the long period of coal formation in Pennsylvania.

Rinaldo Cappellini, who on Aug. 1 became president of District No. 1, **United Mine Workers of America**, at Scranton, has named **Alexander Campbell**, **Anthony Surovich** and **Thomas John**, members of the wage scale committee, to succeed **M. J. McGowan**. **A. J. Franey** and **James Hennessey**, who were appointees of former President **W. J. Brennan**. **Miss Luch Breuche** was appointed secretary to President Cappellini. Former President **Brennan** has been appointed an international organizer.

Directors of the People's Fuel & Supply Co., of York, with mines in Bedford County, will ask stockholders to approve an increase in capital stock from \$100,000 to \$350,000.

Appointment of several prominent Philadelphia coal operators to important committees of the National Coal Association has been announced by **John C. Brydon**, president of the organization. **S. Pemberton Hutchinson**, president of the Westmoreland Coal Company, No. 224 South Third Street, is chairman of the finance committee. **G. Dawson Coleman**, Sr., president of the Marshall Coal Company, No. 1448 Land Title Building, and **R. H. Knode**, vice-president of the Stonega Coke & Coal Company, No. 1727 Land Title Building, are named for the foreign trade committee. Mr. Hutchinson also will serve on the Government relations and railroad relations committees.

Frank A. Vershinski, 17, was instantly killed Aug. 6 in a stripping operation at the Sayre colliery, Mount Carmel, when

he was covered by several hundred tons of coal dislodged by a heavy charge of dynamite. His presence in the vicinity was not known and when he failed to return home at the usual time a friend became apprehensive and went to the stripping where the youth's dinner pail was found.

RHODE ISLAND

George H. Webb, Commissioner of Labor for Rhode Island, is making a survey of the coal supply in that state and has sent to retail dealers questionnaires asking for the amount of coal on hand and the probable supply during the winter. The questionnaire also asks for the amount of coal received since April 1, 1923, and the estimated amount required from Aug. 1 to April 1, 1924.

TENNESSEE

The tenth annual miners' field day and first aid contest, given under the auspices of the coal operators of Tennessee, Tennessee mine inspectors and the U. S. Bureau of Mines, was held Aug. 4th at Knoxville. The first aid teams demonstrated four problems: One one-man event, one two-man event, and two full-team problems. **Black Diamond Collieries Company Team No. 4** won the first prize of \$50, **W. H. Sharp**, captain. The second prize of \$45 went to Team No. 3, of the **Black Diamond Collieries Company**, **C. F. Bennett**, captain. The third prize of \$40 went to the **LaFollette Coal & Iron Company** team of **LaFollette**, **N. D. Wilson**, captain. The fourth prize of \$35 was won by the **Highland Coal & Lumber Company** team, of **Davidson**, **H. B. Holmes**, captain. **J. M. Webb**, of the U. S. Bureau of Mines, Rescue Sta., trained the teams in their work.

UTAH

In order to facilitate the distribution of cars to and the handling of coal from mines located on the **Denver and Rio Grande Western R.R.**, **Receiver J. H. Young** will at once construct a telephone line extending from Soldier Summit to Kenilworth, with lines to the Spring Canyon branch, which will be an addition to the present service between these points and is to be used exclusively in the distribution of empties, handling of coal loads, and otherwise serving the various coal operators in that section. It is expected the line will be in operation by Sept. 15. The following mines will benefit most: **Kinney**, **Scofield**, **Utah Central**, **Utah Mine**, **Clear Creek**, **Winter Quarters**, **Mutual**, **Rollapp**, **Peerless**, **Storrs**, **Standard**, **Liberty**, **Castle Gate**, **Rains** and **Kenilworth**. Offices of R.R. agents will be connected with the new circuit and booth phones for use of train crews will be provided at **Hales**, **Spring Canyon**, **Junction** and **Kenilworth Junction**. Great improvement is expected to result in the handling of the car supply in the territory. It will eliminate the indirect method of communication now obtaining with the dispatchers at Soldier Summit through the local agents. The train crews handling coal trains, as well as the mine operators, in direct communication with dispatchers and car distributors and will make possible the handling of special and emergency conditions arising from time to time. The improvement is said to be evidence of the increased interest taken in Utah coal output by the **Rio Grande road**. Other improvements are being considered.

The mine of the **Columbia Steel Corporation** is now ready to produce. The railroad is finished to the tippie yard and all ballasted. The construction of the company's steel plant itself is also making good progress.

WEST VIRGINIA

The Ohio County Fuel Co., of West Virginia, has purchased 3,350 acres of coal in the Richland district in the "Pan Handle," including 29 tracts, for a consideration of about \$839,000. The fuel company is an associate of the **American Gas & Electric Company** and the **West Penn Power Company**, and it is understood the acreage was bought to assure the **Windsor power plant** owned by these companies a supply of coal for their power operations.

Deeds have been filed at Fairmont showing the transfer of 1,000 acres of **Sewickley** coal, the entire plant of the **Rivesville Coal Company** and other interests to **Mortimer L. Hudson** of Chicago, secretary of the **Edward Hines** interests. The deeds convey limited holdings of the **New England Fuel and Transportation Company**, comprising **Sewickley** coal on **Pharaoh's** run, just north of **Rivesville**; holdings of **John F. Phillips**, **C. D. Robinsort** and **Jacob F. Straight**, as well as the property of the **Rivesville Coal Company**. The mining plant is known as the **Hood mine** and lies between **Rivesville**

and Fairmont and the Cleveland Coal Company's property. The Hines interests own other large coal acreage in the Fairmont region.

WASHINGTON

The Cinebar Coal & Coke Co. has been incorporated with a capital of \$100,000 by Morgan G. McBride, L. B. Pearce and L. B. McBride, of Seattle, and Cleo N. Henriot and J. W. McBride, of Chehalis, to operate two sections of coal land at Cinebar, 23 miles east of Shehalis.

WISCONSIN

An explosion in the benzol distillation unit of the Milwaukee Coke & Gas Co.'s plant on Wednesday afternoon, Aug. 1, wrecked that portion of the works and caused a loss estimated at approximately \$250,000. Three men lost their lives. The coke unit and the coal handling appliances escaped practically unharmed and little delay will result to these activities of the company. The fire at one time threatened the entire plant, the destruction of which would have seriously curtailed the city's gas supply, as the Milwaukee Gas Light Co. receives all the gas produced by the coke plant. Over 400,000 tons of coal have been handled over the Coke & Gas Co.'s dock thus far this season.

Coal contracts were let by the city of Milwaukee on Thursday, Aug. 2, to the Fellenz Coal & Dock Co. for 1,600 tons of anthracite at \$15.55 for egg and stove sizes, \$13.55 for pea and \$11.05 for buckwheat. These prices are \$1.10 above the prices the city paid last year. The Milwaukee-Western Fuel Co. and the Great Lakes Coal & Dock Co., bidding jointly, were awarded a contract for 21,000 tons of bituminous coal at \$6.20 per ton. The price paid last year was \$5.90 per ton. The United Coal & Dock Co. will supply the city with 20,000 tons of bituminous coal at \$5.54 per ton. The coal embraced in the contracts will be delivered at the various city institutions, including the schools, as required.

WASHINGTON, D. C.

Chairmen of committees of the National Coal Association appointed for the coming year are as follows: Policy committee, J. C. Brydon, president Quemahoning Creek Coal Co., Somerset, Pa.; executive committee, J. C. Brydon (by virtue of by-laws); finance committee, S. Pemberton Hutchinson, president, Westmoreland Coal Co., Philadelphia; foreign trade committee, T. F. Farrell, second vice-president, Pocahontas Fuel Co., New York; government relations committee, Walter H. Cunningham, president, Cunningham, Miller & Enslow, Huntington, W. Va.; membership committee, Walter Barnum, treasurer, Pacific Coast Co., New York; publicity committee, C. E. Bockus, president, Clinchfield Coal Corporation, New York; railroad relations committee, C. H. Jenkins, vice-president, Hutchinson Coal Co., Fairmont, W. Va.

The crew of mine-rescue car No. 2 of the Bureau of Mines, Department of the Interior, has completed a month's work of conducting mine-rescue and first-aid training in various Colorado coal mining camps. Following this work the car proceeded to southern Wyoming to do similar work in that region. The personnel of mine-rescue Car 3 recently conducted training at Russellton, New Castle, Sinnemahoning and State College, Pa. Training has been given at Collinsville, Ill., by the crew of Car 4. Car 5 has been conducting training in Ohio, holding classes in first aid at Coshocton, Zanesville and Cambridge. A class of students at the Case School of Applied Science, Cleveland, was given first aid and mine rescue training. Car No. 6 spent some time in giving first aid training at Waukegan, Moran and Melcher, Iowa. The majority of those attending the classes at Moran were of foreign birth, and unable to speak English intelligently, but in spite of this drawback 18 miners completed the course of instruction. The crew of car No. 7 has conducted training at plants of the Davis Coal & Coke Co. at Thomas, Davis, Kempton, Henry and Coketon, W. Va. Miners taking special courses at the University of West Virginia, Morgantown, have been given training, as have students at the summer session of the New River State School. Every man on the payroll of the Kempton, W. Va., plant of the Davis Coal & Coke Co. has at some time completed the Bureau of Mines first-aid course of training. Car No. 8 recently conducted classes at Henryetta, Okla., during the progress of the King Coal Carnival.

A description of the Wheat electric cap lamp, a recent addition to the list of electric lamps placed on the permissible list of the Bureau of Mines, Department of the In-

terior, is given in Serial 2493, recently issued. The Wheat lamp is the seventeenth lamp to be placed upon the permissible list.

A description of one of the recent additions to the list of permissible electric cap lamps approved by the Interior Department, through the Bureau of Mines, is given in Serial 2500, "The 'model E' Edison electric cap lamp," by L. C. Hsley, electrical engineer, and A. B. Hooker, assistant electrical engineer. This lamp has been given approval No. 18 by the Bureau of Mines. Serial 2500 may be obtained from the Department of the Interior, Bureau of Mines, Washington, D. C.

CANADA

The Canadian Pacific Railway has not announced its decision in regard to reduced rates on western coal to eastern Canada in line with the policy of the Canadian National Railways. Sir Henry Thornton, president of the C. N. R., announced in the West a few days ago that the government lines would grant an "experimental" rate of \$7 a ton on coal to the East. It is understood that the Canadian Pacific Railway has this question under advisement, and that a decision in favor of or against the experiment may be made within a few days.

H. Greenfield, Premier of Alberta, expresses confidence that Alberta coal can be shipped into Ontario and sold at a price that will be lower than that paid for Pennsylvania anthracite. The success of selling Alberta coal in Ontario depends upon what rate the railway companies will fix for carrying the fuel, Premier Greenfield writes. The recent experiment of shipping Alberta coal for demonstration purposes in Ontario was so successful that the Alberta government is hopeful that the railways will see their way clear to cut the present rate of \$9 per ton.

A four-foot seam of coal has been discovered at Block Brook, Boularderie, Cape Breton, Nova Scotia. The discovery promises a possibility of a deposit of upward of 3,500,000 tons of excellent coal. The property is situated about 500 feet from the main road and less than 500 feet from the deep water of the Bras d'Or, and is so situated that a trestle can be constructed to deep water of the Bras d'Or where there is sufficient water to accommodate any steamer that could navigate the channel.

The fuel authorities of the Dominion Government are watching the United States coal situation. The Advisory Fuel Committee, established by the government last summer, is still in operation and is working in harmony with the Dominion Fuel Board set up last winter for the investigation of the general question of fuel supply. Touch is also being maintained with such of the provincial fuel controllers as are still in office. According to the latest returns available at the Dominion Bureau of Statistics, imports of fuel into Canada during the present season have been kept up to the average. The imports of anthracite from the United States for the first quarter of the coal year were 1,303,000 tons, as compared with 260,000 tons in 1922, and 1,238,000 tons in 1921. The imports of bituminous coal from the United States for the same period have been 3,392,000 tons this year, as compared with 1,580,000 tons in 1922, and 2,516,000 in 1921.

Association Activities

Coal and coke agents of the railways operating in the states of Indiana and Illinois are to hold their September meeting in Cincinnati, according to an announcement made in Cincinnati by Fred Reigel, agent for the Southern Railway. Rates and general traffic matters concerning the movement of coal will be gone over. This is the first time that these agents have held their meeting outside of Chicago for years.

Shippers in upper Wisconsin and Michigan and coal dock operators at various lake ports in those regions have issued a pronouncement against "any form of compulsory consolidation of railroads." They hold that more economy can be effected and greater good done to the business interests, as well as to railroads of the country, by the removal of even a small part of the unnecessary expense now placed upon the carriers by some of the useless federal and state regulations than can be brought about by any scheme of consolidation.

There is a movement on foot to bring about a unification of rail terminals at Milwaukee. This is of interest to the coal trade, as fully 80 per cent of the coal business of the port is handled over the rails of one railway line. The unification, when brought about, will result in a large saving in switching charges on coal alone.

Obituary

Harry C. Mason, land agent for the Lehigh & Wilkes-Barre Coal Co., died at his home in Wilkes-Barre on Aug. 2, after several months' illness. He had been land agent for the company since 1899, previous to that time having been a member of its engineering corps.

A. H. F. Mitchell, pioneer coal man of Utah, died recently at Logan at the age of 88. Mr. Mitchell was interested in the development of the first coal mines at Coalville. He was a native of England.

Charles S. Cannon, of the C. S. Cannon Coal Co., of Seattle, was drowned in Hoods Canal near Union City, Washington, July 17, while trying to save a 13-year-old girl who had fallen out of a rowboat in which they had been riding.

Coming Meetings

The American Institute of Mining and Metallurgical Engineers will hold its annual meeting in Canada. The meeting will start Aug. 20 at Toronto and end Aug. 30 at Montreal. Secretary, F. F. Sharpless, 29 West 39th Street, New York City.

Rocky Mountain Coal Mining Institute will hold its summer meeting Aug. 27 to 29 at Salt Lake City, Utah, in conjunction with the International Safety and First-Aid Meet. Secretary, Benedict Shubart, Denver.

New York State Coal Merchants' Association will hold its annual convention on Sept. 10-12 at Sacandaga Park, N. Y. Executive secretary, G. W. F. Woodside, 250 Arkay Building, Albany, N. Y.

Oklahoma Coal Operators' Association will hold its annual meeting Sept. 13 at McAlester, Okla. Secretary, A. C. Casey, McAlester, Okla.

The American Mining Congress will hold its twenty-sixth annual convention in conjunction with the National Exposition of Mines and Mining Equipment, Sept. 24-29, at the Milwaukee Auditorium, Milwaukee. Secretary, J. F. Callbreath, Washington.

National Safety Council will hold its twelfth annual safety convention at the Buffalo Statler Hotel, Buffalo, N. Y., Oct. 1-5. Secretary, W. H. Cameron, 168 No. Michigan Ave., Chicago, Ill.

The West Virginia-Kentucky Association of Mine, Mechanical and Electrical Engineers will hold its annual meeting Oct. 19-20 at Huntington, W. Va. Secretary-treasurer, Herbert Smith, Robson-Prichard Bldg., Huntington, W. Va.

Coal Mining Institute of America will hold its annual meeting Dec. 19, 20 and 21 at Pittsburgh, Pa. Secretary, H. D. Mason, Jr., Chamber of Commerce Building, Pittsburgh, Pa.

COAL AGE

The Only National Paper Devoted to Coal Mining and Coal Marketing

C. E. LESHER, Editor

Volume 24

NEW YORK, AUGUST 23, 1923

Number 8

The Deadlock Broken

NEGOTIATIONS between the anthracite operators and miners were at a standstill for three weeks. The Coal Commission called both sides to New York and in three days got the wheels in motion again. That summarizes the situation, but it does not tell the story.

On July 26 John L. Lewis told the conferees, in session at Atlantic City since July 6, that unless the miners' demand for the adoption of the "principle of complete recognition and the check-off" be granted at once negotiations would be terminated. The operators the following day refused and the party broke up.

In the time that intervened until the Commission called them to New York the country has been wondering what it was all about and has been calling loudly for the government at Washington to do something. The press was petulant toward both parties but was beginning to say that the union was going too far in depriving the country of coal just because the operators would not collect its dues for it.

Whatever it was that Mr. Lewis and his advisers had expected would happen as a result of their surprising stand did not come to pass. They were losing ground at home and gaining none with the public. Back in the mining regions the men and their wives could get up no enthusiasm over another strike, and for such a cause. Lewis' famous luck was failing and the breaks were going against him.

Last week the Coal Commission took a hand. It asked the two interests to meet with it—not together but separately. It maintained a position of fact finding. No attempt at mediation, no effort to suggest that this or that would be a good way to settle the matter. The Commission wanted to know what it was and why that kept the parties from completing their negotiations and preventing a strike. The Commission announced that it was going to keep its fingers out of the machinery; would write no contract. It was after the big "why," and would report back to President Coolidge. He might tell the people.

Lewis opened the proceedings with two proposals, one stating the conditions under which he would drop the demand for the check-off, the other providing for keeping it. The second was impossible, and maybe he thought the operators would not accept his first. He was in a jam over the check-off issue and was hard after some way to drop it and save his face. The operators accepted his proposal to drop the check-off all around. They agreed to take cash for what the miners bought from them instead of deducting it from their pay.

That would not do at all. It would be most unpopular in the region. So over night Lewis did the Houdini act none too gracefully and squirmed out. He had to.

Two days gone, leaving the Commission "frankly discouraged" and but little wiser, the public gratified one morning with "No Strike" headlines and perplexed

the next with "Danger Not Averted." What was going on was that negotiations had been resumed with every move a public note with all that that implies—one thought for result and two for effect. To have pursued that course would soon have involved the Commission in the negotiations.

The Coal Commission held and still holds the trump card. Both sides know that whatever they may hold to be the facts, if and when the Commission states its opinion its position will come pretty near being the last word with the country. So, when on the morning of the third day the Commission asked them to report by night whether it was not possible to resume negotiations, they lost no time in announcing that negotiations would be resumed almost at once. Not a word about the check-off; that is dropped for the time being.

Matters are back where they were on July 26, when Lewis issued his ultimatum. Nothing has been gained save delay, a provoked public, and a feather in the cap of the Coal Commission.

The Unfair Assigned Car

THERE seems to be no end to the argument over the assigned car. The Interstate Commerce Commission having disposed of it, the beneficiaries of the condemned practice arise en masse saying that there must be some mistake and ask for a rehearing and re-argument of their case. The Interstate Commerce Commission must answer them one way or the other soon.

The essence of the matter is that the use of the assigned car is unfair. It is unfair because it gives to a few consumers a great advantage in point of regularity and assurance of supply of coal and, not quite incidentally, an advantage in price. It is unfair because it gives to a few producers a larger proportion of transportation service than to the remainder and at a time when transportation service is the most valuable thing they desire.

The case with respect to the private car hangs on the same principle. The title to these cars rests with a consumer or producer and not with the railroad. The owner may say where these cars shall be placed and where transported. But because of this control he may not concentrate his cars at one mine in such manner as to give that mine better running time than other mines similarly situated. Transportation service as a whole must be equitably divided among the mines, and cars are but a part of that service. Motive power, trackage and all other facilities are involved. The Interstate Commerce Commission has decreed that private cars may not be used on an assigned basis because they thereby absorb an unfair amount of the limited transportation service afforded.

The arguments of the railroads and others for the assigned car consist mainly in assertions that they are better served thereby and do not see how they can get

along without the privilege. Nor, apparently, will they find a way until they have to.

It is no solution for the problems of intermittent operation and overdevelopment of the bituminous-coal industry to regulate it through the railroads. That was tried at the beginning of war control and signally failed. Abolition of the assigned car in all its forms makes for freer and more openly competitive conditions in soft coal—the condition contains the cure within itself.

Justice Takes Sides

CRITICS frequently, and with cause, have questioned the symbolic correctness of the blindfolded figure of justice on our court houses. Justice, say they, is never blind and if she is she should be deprived of her sword. Justice is not impartial; she takes sides—after determining the right. She is not blind but of keen sight. Blindness and impartiality are not attributes of justice, and what is more they do not make for peace. So long as justice is blindfold and visionless what is left for contending parties but to fight? It is solely because justice is able to see and takes action according to her vision that we have peace. We shall never have peace if justice takes the position that a quarrel is something about which she should have no opinion, that all quarrels are private and that quarrelers are all of a sort and that bad.

When the war commenced that was the attitude the American public took. Some, it is true, said merely that it was not our quarrel, but others judged the quarreling itself was wrong and said that France as a quarreler was no better than Germany, another quarreler. At a first-aid meet in the anthracite region a learned judge told his hearers that the United States was superior to the nations of Europe (including France, Belgium and Great Britain) because while his auditors were busy in the preparation for rendering first aid, Europe was busy preparing for slaughter.

The war kept on, nevertheless, no matter how much we reprobated and deplored it, because the United States did not see fit to take sides. The judge of whom we have spoken had been taking sides daily in the settling of the affairs brought before him. The judge's decisions were a power for peace, but entirely forgetting that he gave advice to his auditors at that first-aid meet, which was of a kind that, being so frequent here, prevented action that would have caused a discontinuance of the war.

The public is like the judge in his first-aid speech and like the symbolic figure of justice over the court house. It says in the present controversy that the miners and operators probably are alike to blame. It refuses to take sides. It prides itself on its colorless opinion. It is not really interested to inquire who is right. It has gone only so far as to declare that the difference should be settled. How it should be settled is none of its business. So the disagreement goes on and will go on till the dominant factor, the public, decides who is right or until one of the quarrelers is more badly stricken than the other, and has to give way, right or wrong.

The public cannot avoid its responsibility. It cannot take the attitude that it is not the public's business who is right. The public can keep out of the matter as the United States kept out the war, but if it does so it must be content to see the disagreement go on. So long as it says a quarrel is a quarrel and

that both sides are to blame, it is necessary for it to wait until one side beats down the other, and it cannot complain if the rounds last too long or are too many.

Coal Age is not much in favor of official interference. Wages are determined unsatisfactorily by arbitration. It is difficult to tell which wage is right. But if it is too hard for the public to tell, it is surely a difficult problem for prejudiced parties. It is natural they quarrel. If the issues are indeed undeterminable and unjustifiable, let the public make up its mind that this dispute is a natural and not a vicious one on either part and if the quarrel is not of that character let the public take a hand at ending it. But to say there should be no quarrel is to say that the millennium should be reached in which every one will see with the eye of his neighbor, and to say that there should be no inquiry as to who is right but that both should be condemned is to make provision for a winter with no anthracite on the market.

Even without executive action a well informed public with fixed notions as to the right could do much to prevent a strike or end one speedily should it be started. But so long as it has no notions about the matter, it is as futile as was the United States subsequent to its declaration of neutrality of mind and deed and prior to its entry into the war. Only Mr. Ford believed the reprobation of both parties would have a favorable effect. It is at least debatable whether the war would have been prosecuted by Germany if Americans even without being aggressive had been as positive then as they are today that Germany did wrong to invade Belgium and France and had protested accordingly.

All this is said because of the ridiculous editorials of the daily press and in view of the announced intention of the New England consumers to punish both parties by a boycott. Despite all their knowledge of the conditions the dailies steadily proclaim that to stand up for one's rights is criminal and shows an indifference to the public interest. The press boldly proclaims that it knows nothing and wants to know nothing, except that both miners and operators delight in quarreling, profit by it, rejoice in it as we declared the Allies and all Europe did up to and until the day we declared war on Germany.

So long as the princes condemn both Capulet and Montague for quarreling and make self-defense against aggression a crime, setting up no tribunal to discover the aggressor, so long will there be brawls in the street and the city will be "profaned" with "steel." Our American public refuses to give judgment either as to criminal or civil dissension. It is neutral, negative and therefore powerless. This is not the stand of justice. Justice takes sides or it ceases to be justice and becomes a feeble poltroon.

Commissioner Marshall is reported to have said "What the public wants is justice to both sides and plenty of coal. Anything that can be done will be done, but the thing we are not going to do is to write their contracts for them." The last statement means that the public does not want to dispense justice but intends to satisfy itself with demanding peace. The pleasure loving and badly stricken Mercutio may be excused for saying on the spur of the moment, "A plague o' both your houses," but it is not the function of princes or the public to deliver a ban that so completely overlooks justice and makes necessary the private arbitrament which it so freely condemns.

Main or Hoisting Shaft of Grasselli Chemical Co., Terre Haute, Ind., Under Construction

In Sinking Spelterville Shafts Through Wet Sand Sizes Are Increased to Offset List of Caisson

Many Shafts in District Have Crooked Guides and Are Not Successfully Sealed Against Water—Pressure in Spelterville Caisson Reached Limit of Human Endurance—Listing Prevented by “Kickers” and Blocking

By ALPHONSE F. BROSKY

Assistant Editor, *Coal Age*, Pittsburgh, Pa.

WHEN shafts have to be sunk in loose water-bearing soils the unfavorable conditions frequently seriously interfere with a close adherence to specifications, making changes necessary in the design of the shaft and modifying the methods by which it was at first proposed to sink it. To provide against difficulties in the sinking of shafts, boreholes should be drilled and their records carefully studied in the light of previous experience. Such a study will enable the shaft sinker to anticipate his problems and to prepare to solve them, but at best the difficulties may be so many and so perplexing as to tax the resourcefulness of men who are well experienced in the art of sinking in loose water-bearing strata.

When the Grasselli Chemical Co., in 1921, opened up its Spelterville mine in the No. 4 coal seam, five miles north of Terre Haute, Ind., and awarded the contract for the sinking of two shafts to the Dravo Contracting Co., of Pittsburgh, Pa., that firm decided to forecast to the best of its ability the difficulties that might arise, and to plan expedients for every emergency. Accordingly, a study was made by this company of the shaft-sinking methods that had been employed at mines in the vicinity of the properly. However, most of these mines are in the Clinton district to the north of Spelterville and on the west side of the Wabash River, where in most cases the shafts were sunk in timber by the open method, no serious difficulty being encountered.

In a few instances steel jacking plates, followed by skin-to-skin timber sets, were employed. In a number of cases, however, the shafts were not plumb when finished, and in others it was impossible to shut off the

water at the rock because of the methods employed. After inspecting the timber lining in these shafts and noting the unsatisfactory performance of the hoisting cages consequent on the crookedness of the guides, the contracting company concluded to employ pneumatic caissons in sinking the shafts of the Spelterville mine.

Boreholes on the site of the auxiliary shaft showed a bed of sand and gravel 140 ft. thick that overlaid solid rock in which a permanent seal could be made. Of this thickness 111 ft. was water-bearing. Boreholes at the location of the main shaft revealed that it would be necessary to sink through 160 ft. of sand and gravel and that 105 ft. of this thickness was wet.

FIG. 1—REINFORCING RODS AND LUBRICATING PIPES IN AUXILIARY SHAFT

One block is in position and is ready for the placing of forms for the next block. The eight so-called lubricating pipes emit water, steam or air and loosen the sand and gravel around the caisson, thus enabling the shell to slide down more freely than if the material were packed around it.

NOTE—In the headpiece the pile of sand on the right is an accumulation from the blowpipes. It represents the sand and gravel which occupied 48 ft. of the shaft excavation.

FIG. 2—PLACING INSIDE FORM AT AUXILIARY SHAFT

The forms are built on the ground and placed by a derrick. As soon as the outer and inner forms have been set and secured, concrete is poured from the tower in the rear.

Hydrographs of the Wabash River were studied, and the hydraulic gradients at various stages were plotted. Data on other water problems also were carefully considered.

Finally it was decided that pneumatic caissons would successfully penetrate this sand and gravel but that a pressure of 51.5 lb. per square inch would be required in the working chamber to overcome the hydrostatic head at these depths. Though two shafts had to be sunk the construction program permitted the sinking of one shaft at a time, so that the compression machinery used for the auxiliary shaft could be used for the sinking of the main shaft as soon as the former had been sealed at the rock.

An inside diameter of 13.5 ft. with a concrete lining of 18 in. was specified by the coal company for the auxiliary shaft. Profiting by the experience of those in the vicinity whose shafts, when completed, were out of plumb, the contracting company planned to sink this shaft with a diameter of 16 ft. on the inside, thus allowing a clearance of 15 in. all around.

Incidentally, this provision was a wise one in that the shell was out of plumb but within the clearance when the shoe was finally sunk to a footing of solid rock. As the caisson walls were 4 ft. thick, the outside diameter of the shell was 24 ft. Steel rods, placed horizontally and vertically, were used to reinforce the shell, which also was fitted with lubricating pipes at eight equidistant points in its periphery to lubricate the outside surface with water, steam or air, injected under pressure from the top of the shell. In the course of sinking the shaft lining these pipes were used frequently to reduce the skin friction and thus insure an even downward motion with the cutting edge at times crowding the diggings.

From the top elevation of 491 ft. the shaft was sunk by the open method to an elevation of 458 ft., a depth

of 33 ft. below the surface, at which stage the concrete deck was put on at a height of 35 ft. above the shoe. An orange-peel bucket was employed to remove the excavated material. The lining of concrete was lengthened in lifts of 8 ft. At a depth of 58 ft. below the surface, equipment was added to furnish air at an initial pressure of 16 lb. per square inch.

The crews worked in three 8-hour shifts. Whenever the materials excavated were sand and gravel they were blown out in 6-in. blowpipes. Where the caisson tended to stick, the skin friction was reduced by means of the lubricating pipes.

The buoyant effect of the high air pressure coupled with the lack of resistance of the fine sand through which the caisson was sunk caused the latter to be unstable and difficult to control. It was badly out of line just before it reached the rock, and in consequence much labor was spent to land within the clearance of 15 in. allowed all around.

At the surface "kickers" were used on the low side between the soil and the lining, and diametrically opposite an excavation was made with the orange-peel bucket from the surface to the upper water level. On the inside a system of blocking was placed under the shoe to retard the downward movement of the low side.

When the shell landed on a coal seam 22 in. thick which lies above a bed of fireclay next to the rock the lining was 10½ in. out of plumb. Moreover, it was discovered that the bottom of the shoe leaned in the direction of the dip of the coal, but not to the same degree. The dip, in fact, amounted to 12 in. in a length equal to the outside diameter of the caisson. Taking into account the difference in levels of the high and low side of the shoe, the low side hung at a height of 10½ in. above the coal, yet was slanting with the dip nevertheless.

Because the coal seam dipped in a direction that hindered rather than aided in obtaining an even bearing, the 10½-in. gap on the low side of the shoe was blocked up and the coal was dug out under the high side of the shoe. Thus the shoe was adjusted to an even bearing without disturbing the alignment of the shaft. The process of dropping the caisson through the coal to the fireclay was essentially slow because it became necessary

FIG. 3—BLOWING DRY SAND FROM AUXILIARY SHAFT

At one stage in the operations dry sand was raised from the working chamber to the surface, through a 4-in. pipe, the air having a pressure of 19 lb. per sq.in. It was found that it was easier to bring the sand up when dry than when wet.

FIG. 4—ANOTHER VIEW OF BLOWPIPE IN ACTION

The shoe was at this point 79 ft. below the top of the concrete. A hoarding has been erected to precipitate the material blown from the pipes.

to "lock out" the coal in buckets as it was dug. At this level the shifts were changed every half hour, as the men were working under pressures of from 49 to 51 lb. per square inch, nearly three and one-half atmospheres. After much effort the caisson finally was leveled up in the fireclay, and preparations were then made to drop it to the rock. By this time the shell had become very light.

After numerous "blow-downs," or reductions in pressure, were made within the air chamber the shell finally landed evenly on an elevation of 353.5 ft., which was the horizon to which the excavation had been squared up in the fireclay. Each "blow-down" was accompanied by an inrush of sand and water; in some cases as much as fifty bucketfuls had to be removed between successive attempts to drop the shell to its final resting place.

No difficulty was experienced in caulking the shoe, which was accomplished by the use of oakum and an unusually stiff grout. The rock was excavated $2\frac{1}{2}$ ft. lower than the shoe, and in it forms were placed for the first half of the seal. Concrete was poured and then held in place under a pressure of 51 lb. per square inch for four days to allow it to set sufficiently.

After the compressor was stopped and the air was gradually cut down to normal, it was found that the hole made 13 gal. of water per minute, which, it was felt, could be closed off in the second seal. At bedrock the hydrostatic head was 115.65 ft., equivalent theoretically to a pressure of 50.2 lb. per square inch. The maximum air pressure carried in this work, as before mentioned, was 51.5 lb.

Upon completion of the first seal in the auxiliary shaft the air equipment was removed. Excavation proceeded in the open in preparation for the second seal which extended in solid sandstone for a depth of 2 ft. below the level at which the first seal was made. The leakage of 13 gallons per minute which found its way through the first seal was closed off almost entirely by the second seal, as was proved by closing the stop cocks on the grout pipes placed in the wall. Grouting through these pipes was the last step in the highly successful undertaking of sealing the shaft. The time required for the work to this point was about five months.

A detailed account of the work of sinking the main shaft is unnecessary inasmuch as many of the difficulties encountered have been already described in relation

to the auxiliary shaft. Similar methods were employed in the sinking of both shafts. Work on the main shaft had been going on for nearly two months simultaneously with the work being done on the auxiliary shaft, and the two jobs were so nicely scheduled that the main shaft was ready for the use of the air equipment at the time the auxiliary shaft was first sealed. The specifications provided that the finished shaft should have an inside diameter of 18 ft.

It was sunk, however, with an inside diameter greater than that specified by the coal company, namely 20 ft. This gave a clearance of 12 in. all around, which was less than that allowed in the sinking of the auxiliary shaft. The contracting company felt sure that the main shaft would not show a list beyond the limits allowed, reasoning that the smaller shaft when it landed on the rock was off less than 12 in., and that the crews, being more familiar with the conditions to be met, would be able to sink the second shaft more accurately.

From a surface elevation of 519 ft. the shaft was sunk to an elevation of 428 ft. before the caisson deck was installed and preparations were made for pneumatic sinking. A massive sandstone which pitched slightly was reached at an elevation of 362 ft. This was squared up and penetrated for a depth of 10 in. to form a footing for the shoe.

When sealed the leakage amounted to no more than two gallons per minute. The maximum working pressure in the air chamber to counteract the final hydrostatic head of 105 ft., or 45.5 lb. per square inch, was 47.5 lb. This pressure, by the way, was increased to 49 lb. while concrete was being placed.

As one might well realize, no little difficulty was experienced in sinking the shell so that it would land on the solid rock within the limit of 12 in., which was the maximum displacement allowed. As in the sinking

FIG. 5—POURING CONCRETE INTO EIGHT FOOT FORM

The shaft is only just started, this being only the second block to be poured, no air being used at this stage of the operations.

FIG. 6—CROSS-SECTIONAL PLAN OF AUXILIARY SHAFT

This shaft is only 13 ft. 6 in. in internal diameter. It is intended to accommodate a single counterweighted cage. The center line of the cage is 3 in. south of the center line of the shaft. In consequence the southern buntion is 12 in. shorter than the other.

of the auxiliary shaft, the caisson naturally was difficult to control by reason of its deck, which had an area of 616 sq.ft. and was 35 ft. above the shoe. The bottom of the shell was not at any time really fixed, due to the buoyancy of the air chamber.

Consequently when the top listed from the vertical, the caisson was righted only with great difficulty. In fine sand and in the presence of water the skin fric-

tion, which is slight enough at best, is made less by the upward movement of escaping air, and as a result the pneumatic caisson frequently founders. Closest attention to the manipulation of the blocks on the inside and "kickers" on the outside is essential to keep the caisson erect. With each "blown-down" the "kickers" were adjusted, and the top, which at one time leaned 24 in. out of plumb, was "kicked back" to within 10 in. of being plumb when the shell was finally landed.

No further trouble was encountered in extending the shafts to the No. 4 seam of coal. The depths to coal are 181 ft. and 197 ft. for the auxiliary shaft and main shaft respectively. Figs. 6 and 7 show in plan the general arrangements of compartments in both shafts as specified by the engineers for the coal company. As is evident from an inspection of Fig. 7, the ultimate capacity of this mine is not meant to be large, or a single counterweighted skip would not have been selected. This provision though unusual is in accord with good engineering practice.

The success of this shaft-sinking job emphasizes distinctly the need of forethought in putting down shafts through alluvial deposits and soft ground. In spite of all that is known of the technique of shaft sinking, many failures in this work have been reported and many shafts have been sunk at undue cost.

As a rule shafts cannot be made too large, but in many cases they are constructed too small. Had these shafts in Indiana been sunk to correspond with the exact needs for the hoisting equipment, they would when they were completed, unless irregularities in the guides had been tolerated, have had a plumb diameter about 2 ft. less than that specified.

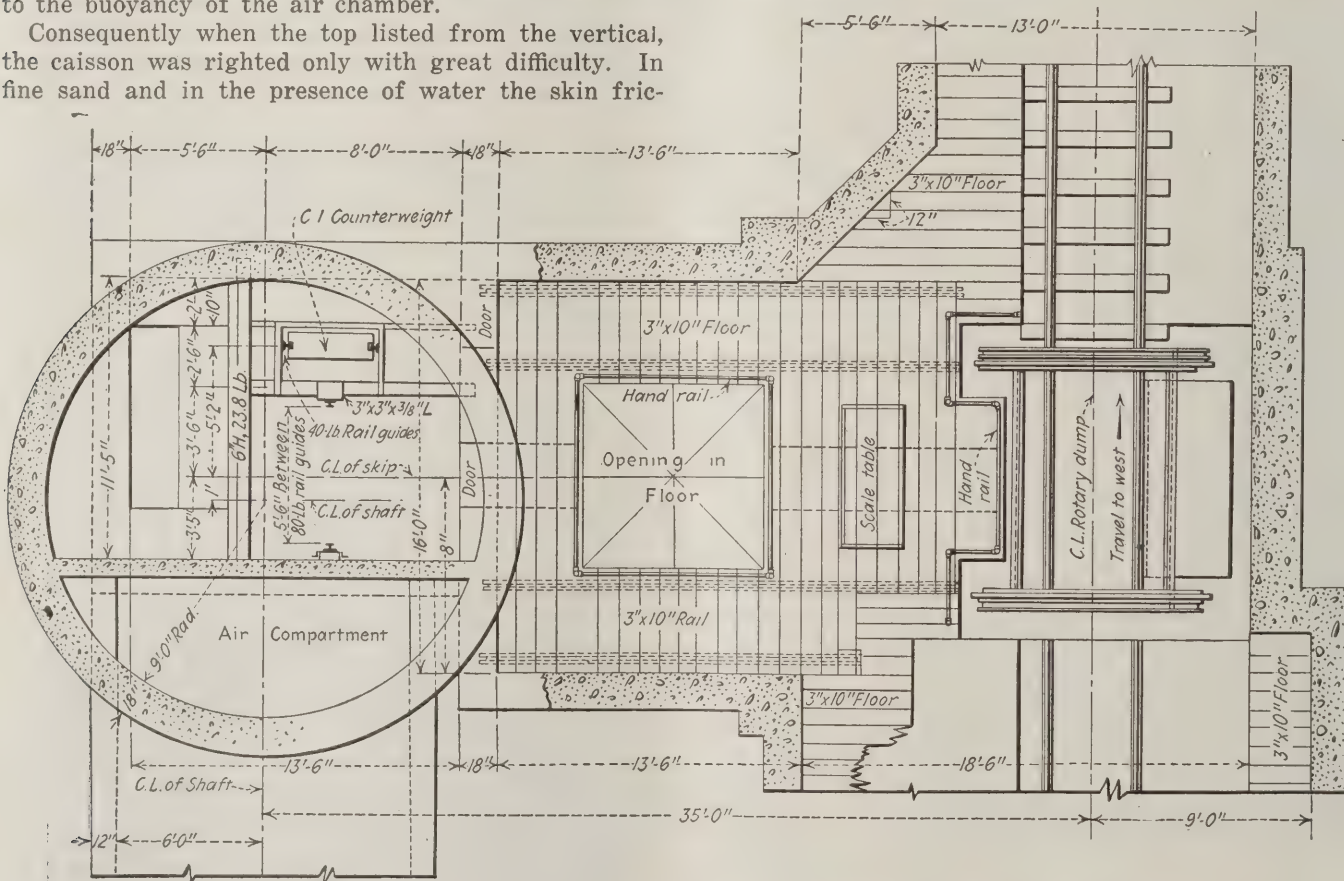

FIG. 7—CROSS-SECTIONAL PLAN OF FOOT OF MAIN SHAFT SHOWING ROTARY DUMP

The shaft has a segmental air compartment which is formed by the introduction of a concrete partition. The counterweight is placed on the opposite side. A buntion is placed at right angles to this partition between it and the shaft wall, and this in turn supports another buntion placed parallel to the partition. The skip guides are placed on this wall and on the second buntion.

Can Expel Water from Wet Slack by Oils and Pressure; Much Ash Leaves the Coal with the Water

Use Only Three to Ten per Cent of Oil for Flocculation—Addition of Oil and Pressure of One Ton per Square Inch Reduces Water in Pulp from 130 to 10 per Cent of Solids—Coal Briquets Well Without Further Drying

BY C. H. S. TUPHOLME
London, England

TWO important developments have recently been made in rendering the concentrates from the froth-flotation system of coal washing more suitable for industrial purposes. It is obvious, from a study of the froth-flotation process, that the resultant concentrates are finely divided coal particles mixed with a large quantity of water, and it is naturally essential that these concentrates should be at least substantially separated from the water with which they are originally in such close association. After conducting a number of investigations, Minerals Separations, Ltd., the operators of a froth-flotation method, have discovered two ways to separate the coal particles from the associated water.

In the first method the froth flotation concentrates or other powdered coal particles associated with water are suspended in sufficient water to make a mobile pulp. This pulp is then subjected to agitation, usually with aeration. To this is added an oil, tar or some other hydrocarbon or carbonaceous liquid, which has the property of coating the coal particles and also of causing the coal particles coated, to flocculate together, after which the coated and flocculated particles are separated from the water by draining or filtration without being compressed into blocks or briquets.

It has been found that certain oils, tars and other hydrocarbons or carbonaceous liquids, which are incapable of forming briquets of carbonaceous materials, possess these coating and flocculating properties.

NEED BUT LITTLE FLOCCULATING MATERIAL

It has also been determined that this flocculating effect occurs with very small quantities of these agents when in water. The quantities of the reagents may be small, (from 3 to 10 per cent of the weight of the coal, for example) sufficient only to coat the coal particles with a fine film like a varnish, and a quantity quite insufficient to fill the interstitial spaces between the particles.

The flocculated particles include in the interstitial spaces a large proportion of water, but owing to the fact that their surfaces have become repellant to the water, it is possible to remove the contained water by filtration or draining, preferably assisted by pressure, and thus the drying of the particles becomes a simple matter.

It may be said here that Minerals Separations, Ltd., makes no claim to the use of the Trent process where coal particles are agitated with a quantity of liquid hydrocarbon up to 40 per cent of the coal to form an amalgam of the coal and oil with the exclusion of the water.

The removal of the water from the coated and flocculated particles may be assisted by pressure. However, it must be remembered that the coating and flocculating

agent does not act as a binder and therefore will not suffice as a binding medium in the manufacture of briquets.

This method offers particular advantages when the coal particles are subsequently to be made into coke, because the hydrocarbons in the flocculating agent are distilled in the coking operation and may therefore be recovered. Moreover, the presence of these hydrocarbons in the mass of the flocculated coal particles constitutes an addition of volatile matter which assists the coking of special types of coal, which would otherwise be unsuitable for the manufacture of coke.

The quantity of the agent employed is sufficient to produce the flocculation at the temperature of the circuit water. It may be reduced by using a heated circuit, but the treatment is better performed at atmospheric temperature. From 3 to 5 per cent has been found sufficient when anthracene oil, coal-tar, coal-tar oil and other reagents are used. The following are examples illustrating the application of this process.

Coal from a Durham shaft mine was ground to pass a screen of 0.1 in. aperture. The ground coal was concentrated by flotation, using 0.5 lb. of creosol and 0.125 lb. of paraffin per ton of coal. The concentrates removed had a water-to-solid ratio of 1.3 to 1.

The concentrates with their associated water were placed in a vessel of square horizontal section, and were agitated by an impeller rotating with a peripheral velocity of about 600 ft. per minute. Coal tar from coke ovens was added during the agitation, the quantity of tar amounting to 4 per cent of the weight of the dry concentrates. The test was made at room temperature. The coal became intensely flocculated and readily separable from the water.

PRESSURE AND LITTLE HEAT ALMOST DRIED COAL

The bulk of the water was removed by draining, but it would be assisted, if desired, by subjecting the flocculated coal to compression. Under a pressure of 2 tons per square inch, the coal became substantially free from water, and in drying it in a water oven at a temperature of 100 deg. C. for a period of 3½ hours, the weight diminished by 2.7 per cent, which indicates the small quantity of water remaining.

The coal was thus formed into a cake which, however, could be easily crumbled between the fingers. It will be understood that it is not essential to compress the coal into cakes in this way although this may be done both to assist removal of the water and to facilitate handling of the treated material.

In the second case, coal from the Powell Duffryn mines was ground to pass a screen with an aperture of 0.1 in. The coal was concentrated by flotation using ¾ lb. of creosol and 0.5 lb. of paraffin per ton of coal, in which operation the ash content was reduced from

15 per cent to 5 per cent. The concentrates removed had a water-to-solid ratio of 1.35 to 1.

These concentrates with their associated water were transferred to a vessel, in which they were agitated as in the first example and during the agitation anthracene oil was added, the quantity of oil being 3 per cent of the weight of the dry concentrates. This operation was performed at room temperature. An intense flocculation was produced, and when some of the flocculated coal and water was placed on a 60-mesh screen, clear water ran through, and the greater part of the contained water drained away.

When the mixture of flocculated coal and water was placed in a mold having slits for the egress of the water and subjected to a pressure of 0.5 ton per square inch, some further water exuded, and a cake was formed which contained 12 per cent of water.

A pressure of 1 ton per square inch produced a cake containing 9 per cent of water. In either case the cake crumbled easily between the fingers.

When treating powdered coal not already concentrated to separate the coal particles completely from gangue or other ash-forming materials, it is possible to effect not only the flocculation of the coal particles and the removal of the water, but, also, in the same operation, it is possible to separate the gangue and other ash-forming materials from the coal particles.

Thus, in this method, the finely divided coal particles mixed with gangue or other ash-forming materials, are suspended in sufficient water to make a mobile pulp. This pulp is then subjected to vigorous agitation with a similar flocculating agent in a quantity insufficient to form an amalgam, in which the interstitial spaces between the particles are filled with the flocculating agent, but sufficient to coat the coal particles and flocculate them in water with the aid of the agitation.

The gangue particles are not coated or flocculated, but remain in suspension in the water, and are separated from the coal with the water by draining or filtration. The coal particles cling together in masses which will not pass the screen, and the gangue particles, being unflocculated, pass through in suspension in the water. The draining may be assisted by pressure, or not, but in any case durable briquets are not produced.

REDUCES ASH IN COAL FROM 23 TO 13 PER CENT

In another case waste coal or duff from the Powell Duffryn mine in South Wales and containing 23.04 per cent of ash was made up into a mobile pulp with an equal weight of water, and the pulp was agitated, a quantity of coal tar equal to 4.75 per cent of the weight of the crude coal being added so as to produce flocculation.

The mixture was then transferred to a press and subjected to a pressure of 2 tons to the square inch, thereby causing the water to exude. It carried a large proportion of the gangue away with it in suspension. The resulting cake contained only 13 per cent of ash and 5.56 per cent of moisture. This test was carried out at normal atmospheric temperature.

Again the process of flocculating the coal particles may be done in such a way that the coated or flocculated coal particles are floated in the form of a froth, while the gangue remains in the water.

The same material as in the previous example, viz.: pulverized waste coal or slack from the Powell Duffryn mine in South Wales, was mixed with its own weight of water to form a mobile pulp. To this pulp were

added the following reagents: 4.7 per cent of coal tar, 0.075 per cent of creosol and 0.075 per cent of paraffin oil, these percentages being based on the weight of the crude coal.

After agitation and aeration the flocculated coal was removed as a froth and subjected to a pressure of 2 tons to the square inch. The resulting cake contained only 5.76 per cent ash and 3.87 per cent of moisture. This test was carried out at normal temperature.

In the second method the coal is made readily separable from water and briquets easily prepared either from powdered coal or from the froth flotation concentrates by a cold process.

During investigations it was found that if pitch in a molten condition be mixed with naphthalene, the mixture remains liquid but viscous at ordinary temperatures. Very slight warming thoroughly melts it. This material was used as a binding agent, and in coating the coal particles with it they become readily separable from associated water and can be pressed into briquets.

In this process a mobile pulp of the coal and water is agitated with a binding agent consisting of pitch which contains naphthalene or phenanthrene so as to coat and flocculate the particles as in the previous method. On introducing the pulp into a press, also at normal atmospheric temperatures, and subjecting it to a pressure of 2 tons per square inch, an excellent briquet is produced, substantially free from moisture. The briquets are hard and durable, and become harder with time, and it is also found that naphthalene volatilizes out of them.

COAL, PITCH AND NAPHTHALENE QUICKLY HARDEN

In the course of investigations it was found that if naphthalene is mixed with molten pitch in the proportion of 1 part of naphthalene to 3 or 4 parts of pitch, the mixture remains liquid for a long time, but if powdered coal be added, solidification occurs after a short time.

It will be understood that this process is applicable to the briquetting of finely powdered coal from various sources, but it is particularly applicable to the production of briquets from coal concentrates produced by froth-flotation, these concentrates being already in admixture with water.

The following is a description by way of example of the application of this invention to the production of briquets from Powell Duffryn slack.

In one test 1,200 g. of Powell Duffryn slack in a finely divided state was treated by froth flotation, the agents added per ton of slack being $\frac{3}{4}$ lb. of cresol and $\frac{1}{2}$ lb. of paraffin. The froth removed contained 1,000 g. of coal in a pulp of 1.3 water to 1 of solid.

To this pulp was added the molten binding agent containing 5 per cent pitch and 2 per cent naphthalene, based on the weight of the coal, and the mixture was agitated, at normal atmospheric temperature under a pressure of 2 tons to the square inch. The water ran away clear from the flocculated material which formed an excellent briquet with a crushing strength of one ton per square inch. In place of naphthalene, phenanthrene may be used.

It will be understood that the expression "pitch" includes such substances as the pitch obtained from petroleum distillation. The expression "finely divided coal" includes all coal of the sizes dealt with in briquetting processes or in the flotation concentration of coal or mixtures of various grades suitable for such treatments.

Why Artificial Lightning Is Produced

Study of Lightning Characteristics—Practicality of Power Transmission at Higher Voltages—Lightning Generator and Its Uses

IN THE production of high-voltage electricity approximating that of lightning, which has caused so much interest in scientific circles, the practical significance of the tests has to a certain extent been overlooked.

FIG. 1—LIGHTNING FLASH

The church steeple in a miniature village is shown here being struck by a 2,000,000-volt lightning bolt.

Man-made lightning is a phrase with which to conjure. Yet the Pittsfield engineers of the General Electric Co., who spent years of study in the production of these highest known artificial electric pressures, did not do so simply to produce a pretty picture of an electric arc or an artificial thunder storm. They had a very definite end in view, namely the devising of more improved methods for protecting electrical systems from the damaging effects of real lightning, particularly on long transmission lines carrying power.

Some of the things which mean much to the engineer in considering the phenomena of lightning were described at a meeting of the American Institute of Electrical Engineers by F. W. Peek, Jr., who conducted the recent spectacular tests, as follows:

"During a thunder storm lightning voltages that reach the transmission line, produce high electric strains across insulators, transformers and other apparatus at the extremely rapid rate of millions of volts per second. With this rapid rate of application the voltage may reach a very high value in a microsecond (millionth of a second). Hence since there is always a delay or lag in the breakdown of insulation, quite peculiar effects result from these voltages. For instance, some remarkable phenomena that take place are: Much higher lightning voltages usually are required to jump a given distance than voltages at normal operating frequencies; conductors at normal frequency voltages often are good insulators for lightning voltages; water may be punctured like oil; the wet and dry spark-over voltage of insulators are equal; the lightning discharge has a markedly explosive effect, etc. In addition to these characteristics a study also has been made of the

change in voltage and of the shape of a lightning wave as it travels over a transmission line at the velocity of light.

"In order that a laboratory study may be of practical as well as theoretical interest, it is necessary to be able to reproduce lightning voltages in the laboratory on a large scale and of known characteristics. This investigation was started some years ago with a 200-kv. generator. This generator has been added to from time to time until now 2,000,000 volts are available and some single lightning strokes can be obtained that increase at the rate of fifty million million volts per second. The power is of the order of millions of kilowatts. It is believed that this generator closely approximates the voltage and other conditions that usually occur on transmission lines. The lightning voltages used in the investigations were far in excess of any heretofore produced in a laboratory.

"Photographic studies have shown the lightning spark-over of insulator strings that are of such length as rarely to spark over in practice even in bad lightning country. The photographs of the flashes show all the characteristics of lightning, such as a zigzag path, side flashes and the like. These studies are of interest in that they indicate a certain protective which must or should be taken in practice. With such voltages and currents possible therefore it is practical to investigate the protective value of ground wires and lightning rods. It is such an investigation as this that is now under way.

"Along with the production of 2,000,000-volt lightning, further studies of our original production of high voltage at 60-cycle frequency have been continued.

FIG. 2—INSULATOR TEST

Under storm conditions long strings of insulators may be tested. In this photograph the discharge has cleared the insulators. Note how the drops of water between the insulators have been illuminated.

Even if transmission at 1,000,000 volts is not definitely in sight at the present time, there are, of course, many uses for such high voltages in the laboratory from the standpoint of research. But it may not be out of place to indicate just what are the possible uses of 1,000,000 volts in practical transmission.

"On such a system the conductor probably would be about 6½ in. in diameter. If it is assumed that this is a hollow tube with copper equivalent to a 1-in. diameter rod it is possible to transmit 3,000,000 kw. 1,000 miles with about 12 per cent loss and 1,000,000 volts at each end. If 5-in. tubes were used there would be very little loss in fair weather, but during a rain storm the loss would be of the order of 1,000 kw. per mile.

"The striking fact that this brings out is the large amount of power necessary to make such a line economically desirable. It also emphasizes the enormous size of the apparatus units necessary. If present practice were followed, 1,000,000-kw. transformer units would be necessary. This probably would mean erecting in the field. The problem of size and transportation becomes greater than the problem of voltage. However, only a little over ten years ago the 200-kv. line was in a laboratory stage similar to the 1,000,000-volt line discussed here."

Use Concentric All-Rubber-Covered Cables

BY L. C. ILLSLEY* AND H. B. FREEMAN†

IN CONNECTION with the approval of coal-cutting machines for service in gaseous mines the engineers of the U. S. Bureau of Mines have been somewhat concerned as to the type of trailing cables that could safely be used on permissible outfits. Though no final action has been taken on this question and tentative approvals have been granted pending investigations the Bureau has been endeavoring to collect data and information on this problem which would permit a fair yet safe ruling to be made.

For this purpose arrangements were made to visit certain of the mines of three coal companies in order that the cables and cutting machines could be observed in operation. In all twenty mines were visited. A questionnaire covering the operations of trailing cables was filled out at each of these mines. In a few instances no personal inspection was made, the information being supplied by mine officials after conferences with the Bureau's engineer. At other mines the information given by mine officials was supplemented by personal observation inside the mines, usually at a time when the cutting machines were in operation.

The points covered by this questionnaire and a digest of the replies to each are presented in the following summary: Fourteen of the mines used voltage from 500 to 550; the others from 250 to 275. The machines were chiefly of the shortwall type, although a few breast machines were in use. Two general types of cables, "twin" and "concentric," were being used. Most of the twin conductor was insulated with rubber and protected by an outer weatherproof braid. Most of the concentric cables were rubber-insulated and further protected by a special rubber outer covering. In many of the mines investigated the twin braid-covered cables were being replaced by the concentric, all-rubber insulated type.

The length of the cables varied from 200 to 500 ft., 250 and 300 ft. being the most usual lengths. The size of cable varied from No. 8 to No. 4, No. 6 for 500-volt and No. 4 for 250-volt being more commonly used. No reliable cost figures were obtained. In most mines the all-rubber protected type of cable had been in service only a few months, and no fair estimate could be made as to its ultimate life as compared with the cheaper braid-covered cables formerly in general use.

ALL-RUBBER-COVERED CABLE OUTLASTS BRAIDED

The life of the braid-covered cable generally was given as 6 to 18 months; in one instance, however, a life of four months, and in another of three years was reported. In several mines the all-rubber-covered cable had been in service about two years and showed little wear. In general the cable of the latter type had not been in service long enough to permit an estimate of its life, but nearly everyone seemed satisfied with its wearing qualities during the time it had been in service and expressed a marked preference for it.

From a safety viewpoint some of the answers to the question, "When are cables discarded and by whose order?" are of interest; for example: "Cable is discarded when the tendency of the cable to blow up becomes too great;" "Cable is discarded when cable blows up too often." The electrician or machine boss usually is the man who decides whether a cable should be discarded.

A cable reel was used in all but one of the mines. In one mine no reel was used on breast machines. This mine reported the shortest cable life of any investigated. Cables deteriorate by being run over, by kinking, by rubbing against coal, etc. The braid-covered cable, especially, deteriorates from becoming water-soaked, also from kinking. Once the braid has become broken deterioration is quite rapid. Twin cables "kink," but concentric cables do not.

INQUIRY DISCOVERS MANY CAREFUL MEN

A good machine man seldom runs his machine over a cable. For some mines the number of times a cable is run over was stated as "once a month," and for one mine the answer was "once a year." In one mine the cable reel was too small for the cable, and the cable was run over "once a week."

Cables usually are repaired by the electrician or machine boss and splices are made by the machinemen. Practically all repairs are made inside the mine. In several mines special splicing clips were used, but knots and Western Union splice were used in many cases. In all cases the splices were taped. No difficulty had been experienced in splicing cables except in one mine that reported the concentric cable as being difficult to splice. The repairs to the all-rubber-covered concentric type of cable were very much less frequent than those to the twin braid-covered conductor.

The voltage regulation was reported as not good in two mines, fair in five mines, and good in the remainder. It generally takes from 15 to 30 minutes to make a cut. One mine reported 5 minutes to sump, 15 minutes to cut, 10 minutes to unload and 5 minutes to load.

Several mines reported some heating of twin cable, but in general no trouble had been experienced with concentric all-rubber-covered cable, either on or off the reel. One mine reported heating of concentric cable

*Electrical engineer, U. S. Bureau of Mines.

†Junior electrical engineer, U. S. Bureau of Mines.

on the reel and said that the cable was cooled by pulling it off the reel. This heating evidently was due either to low voltage or to using too small a conductor for that particular service.

Usually either improvised or commercial hooks were used to attach the cable to the power supply. In a few mines clamps were used. In nearly every case a wood or fiber handle was provided to permit the operative to handle the hook without shock. In a few cases tape or a rubber hose served as protection.

In six mines the trailing cable was protected by a fuse, the fuse generally being placed in the insulated handle of the hook. About the same quality of cable was used for the hand cable as for the reel cable, the tendency being toward the concentric all-rubber-covered type of cable. In mines having water the twin braid-covered cables were seriously affected by wet conditions, but no trouble had been experienced with all-rubber-covered concentric cables.

At a previous conference of representatives of these industries and of the Bureau, it was suggested that the Bureau devise tests to determine the suitability of cables for service in gaseous mines. The data obtained in this field investigation would seem to make such tests, especially on any considerable scale, unnecessary, as in almost every instance the concentric all-rubber-covered type of cable proved to be the safer.

Summed up, such cables have a longer life, require less repairs, do not kink, do not become water-soaked, can be handled with less liability of shock to the machine operative and are gradually replacing the older type of twin conductor which has an outer protection of weatherproof braid.

It is believed that for use on permissible outfits where a high degree of safety is desired, the Bureau would be justified in rejecting cables so constructed that they have a tendency to kink or that are so insulated that they have a comparatively short life.

Magazine Explodes in Drumheller, Alberta

ABOUT 1,000 lb. of black blasting powder and 200 lb. of high explosives are believed to have been in the blast that completely destroyed a powder magazine at the Gibson Colliery, Drumheller, Alta. It is believed that two workmen, W. McKinnie and H. Rees, went to the magazine for powder, one of them with an open light. Fig. 1 shows all that was left on the scene after the explosion occurred. The magazine was a small drift into the hillside about 100 ft. in the hill. Other illus-

FIG. 1—RUINS OF THE MAGAZINE AFTER EXPLOSION

The explosion killed both McKinnie and Rees, who probably were in the magazine at the time.

FIG. 2—WASH HOUSE 300 FT. FROM MAGAZINE

J. B. Scott and H. L. Jones, who were in the wash house at the time of the explosion, escaped with bruises, Scott having a contusion over the left eye and Jones on the side of the face.

trations show the Gibson surface plant and what was left of the wash house after the explosion. One cannot favor the use of an underground magazine, for it is almost necessary to use a light when entering it. No light should be allowed in a powder magazine. All illumination should be exterior—that of the sun or of an

FIG. 3—SURFACE PLANT OF GIBSON COLLIERY

Plant has a capacity of 1,000 tons per day. The coal in the seam worked, No. 5, is 4 ft. thick and the cover runs from 60 to 200 ft. The headframe of the shaft can be seen on the right. The hoisting frame was moved about 6 in. by explosion.

outside electric lamp. The risks run at mining plants are frequently altogether unnecessary and occasionally even criminal. Instances such as this add force to the plea for more care in planning powder houses. The company probably believed that it had a safe powder magazine—well back in the hill. The explosion showed the irony of its belief!

Can Ammonia Be Made, as Well as Saved, from Coke-Oven Gas?

FROM the time of the first recovery of byproducts from the coal in the coke oven, the aim has been to get if possible all the ammonia the gas contains and perhaps still better all the nitrogen as ammonia that is contained in the coal. As there is but little nitrogen in coal the greatest expectation of ammonia output bears only a trifling ratio to the tonnage of coal coked; thus with nitrogen comprising 1.5 per cent of the coal weight which is a big percentage the quantity of ammonia that it might possibly be converted into by combination with hydrogen would be 1.82 per cent.

Assuming that we get 25 lb. of sulphate of ammonia from a net ton of coal, we get 6.58 lb. of ammonia or about 0.329 per cent, roughly $\frac{1}{3}$ or $\frac{1}{4}$ of what might be hoped for. The nitrogen of the coal evidently does not appear in any large measure as ammonia in the coke-oven gas. About three times as much is obtained in the manufacture of producer gas by the Mond process.

It is easy to get any quantity of nitrogen from the atmosphere, but it is less easy to fix it, that is, to combine it with something else to form something for which we have a use such as with carbon to form cyanogen or with hydrogen to form ammonia. However, it is now found possible to combine nitrogen with free hydrogen. Now, free hydrogen can be made from water, but when it is obtained it is in admixture with oxygen and ready to combine explosively with it to form water. It is, however, a large constituent of coke-oven gas. It forms about 5 per cent of the weight of many dry coals, whereas the nitrogen content is barely 1.5 per cent.

Moreover hydrogen goes further in the manufacture of ammonia than nitrogen, weight for weight, and that is what we are considering. Three pounds of hydrogen are needed to make 17 lb. of ammonia, but 14 lb. of nitrogen must be supplied for that purpose. The advantages, therefore, of combining free hydrogen from coke-oven gas with free nitrogen from the air would seem great provided that the operation was not too expensive and the gas was not needed for fuel purposes as it usually is everywhere but at coal mines.

USES HYDROGEN FROM COKE OVENS FOR AMMONIA

M. Claude, a native of France, declares that he has such a process for combining nitrogen and hydrogen and that he can treat the coke-oven gases so as to get free hydrogen combining that gas with nitrogen to make synthetic ammonia. For the facts which follow we are indebted to *Chemical & Metallurgical Engineering*. M. Claude has succeeded in dissolving in ether under pressure most of the coke-oven gases and the volatilized liquids, thus leaving hydrogen as a residuum. Near the end of 1921, Claude at the Montereau works with the use of a simple apparatus of his designing succeeded in producing 230 cu.m. (9,122 cu.ft.) of hydrogen hourly from 300 cu.m. (10,595 cu.ft.) of water gas. He was able to use this hydrogen directly in his production of ammonia. This first apparatus has now been replaced by one having twice that capacity, and the present apparatus is supplying a plant producing 5 metric tons (5.51 short tons) of ammonia daily. The treatment of water gas was but an intermediate step toward the utilization of coke-oven gas.

Nothwithstanding the small quantity of coke-oven gas heated (850 cu.m. or 30,018 cu.ft. per hour), the working pressure of the apparatus at the Béthune plant is somewhat under 24 atmospheres, or 353 lb. It is hoped that a pressure of below 15 atmospheres, or 220 lb. may be obtained with a new type of apparatus now being studied, which is designed to treat 5,000 cu.m. or 176,578 cu.ft. of gas per hour, equivalent to a daily production of 20 metric tons or 22.05 short tons of ammonia.

At Béthune, the gases treated are compressed on coming from the debenzolizing appliances, to a pressure of approximately 25 atmospheres, or 367 lb. The succeeding apparatus for treatment consists of a series of towers. In the first the gas comes in contact with a flow of heavy oil controlled by a small pump. Here any remnants of benzol still carried by the gas are scrubbed out. Thence the gases run into a second column, where they are decarbonated by means of a flow of lime water delivered by a centrifugal pump. The next stage in the process carries them to separators, where the water is taken out as well as any other condensable product.

Ethylene, C_2H_4 , one of the most precious of these, can be recovered separately. The hydrogen taken out is then sent on to a gasometer, and the other gases carrying high methane contents are sent back to the works for utilization. So low is the cost of the hydrogen obtained as above described that it is possible in common practice to use the nitrogen produced in any one of the usual processes.

HALF THE BÉTHUNE GAS WAS CRUDE HYDROGEN

Below are given certain of the results obtained at the Béthune collieries. When 850 cu.m., or 30,018 cu.ft. of gas were treated per hour the quantity of hydrogen obtained was approximately 425 cu.m. or 15,009 cu.ft., per hour, or 50 per cent. This analyzed about 90 per cent pure hydrogen, 1.6 per cent carbon monoxide, and a remainder of approximately 9.4 per cent of nitrogen. Ammonia was produced at the rate of 150 kg., or 330.7 lb. per hour, of which 140 kg., or 308.6 lb., was in the liquid state.

The power required for this operation, including the heating of the tubes, debenzolizing and decarbonization, was approximately 460 kw. The physico-chemical method of decarbonization is to be replaced by a purely chemical method that will reduce the consumption of power below that of the present apparatus.

Claude claims for his process great simplicity, as well as low construction and labor costs. The fact that the gases are compressed for the purpose of recovering the hydrogen from them may be of advantage in carrying out the whole process of debenzolizing under pressure. The yield in benzol would then be increased by 10 to 15 per cent, while the size of the absorption and distillation appliances would be reduced. Naturally, the quantity of solvents or scrubbing oil and unavoidable losses and the consumption of steam, etc., would also diminish.

As the various component parts of the gases are recovered and can be used separately, it is likely that from 150 to 200 kg. (330.7 to 440.9 lb.) of ethyl alcohol will be produced per metric ton of ammonia. The increase of the yield of benzol and the production of ethylene are alone sufficient to make up for the cost of compressing the gases for the separation of hydrogen.

They Used to Scrape a Little Dirt in Kansas Strip Pits, But Now—

BACK in 1898 when the Clemons Coal Co., Pittsburg, Kan., was young, the overburden was removed from the coal as shown in the top picture on the page following. Twenty feet was about the limit of stripping. In the illustration, Ira Clemens, now president of the company, is shown on the left in white shirt sleeves driving a scraper team. Today gigantic steam and electric shovels as big as any used anywhere move 50 ft. of overburden handling 4,000 to 6,000 cu.yd. a day with 6-yd. dippers working on an 80-ft. boom. They turn the flat country into regions of hills as can be seen in the lower picture of the opposing page. Today also strip-pit loaders almost dispense with hand shovels and "elbow grease." The type of loader shown in the center illustration follows the shovels and operates its $1\frac{1}{2}$ cu.yd. dipper horizontally and thus can part coal along cleavage lines without cutting into the tough fireclay "horsebacks" which afflict Kansas operations. Mechanism has eliminated from stripping much of its hard, hot work.

Strip-Pit Operations in the Kansas Coal Fields Today and in Yesteryears

Safety Switch at Slope Mouth Catches Runaway Cars

A Simple Precaution at the
Mouth of the Dolomite Mine
Would Have Prevented Explosion

THAT for an expenditure of \$500 or less made once and for all, a majority of the runaways at slope mines with their trains of calamities to life and property, could be avoided is the opinion of A. J. Moorshead, president and general manager of the Madison Coal Corporation, Chicago, Ill.

A safety switch built on the slope, just outside the mouth of the tunnel, is the safety device upon which Mr. Moorshead pins his conviction. Such a switch with a short track running into an upgrade at the end could be used to catch runaway trips with such ease that it is a matter of wonder that this installation is not standard at every slope mine in the country. A bill is now before the State Legislature of Alabama making safety switches part of the required mine layout.

When Mr. Moorshead's company (a subsidiary of the Illinois Central R.R.) took over No. 11 mine, an eight per cent slope operation at DeKoven, in western Kentucky, he found upon inquiry that many runaways from the knuckle of the dump had occurred with nothing but the chance of a derailment to stop the trip from going to the bottom of the slope or to the face of the workings in the mine. Upon inquiry he found that many such runaways had taken place at DeKoven and that injuries had resulted therefrom, and he immediately directed that a safety switch be constructed near the month of the slope, as shown in the illustrations. This construction cost approximately \$500. Although there have been several runaways from the knuckle since that time, they have all passed to the safety switch, and no persons have been in-

jured nor property been damaged aside from the wrecking of a few cars.

No. 11 slope is approximately 6,000 ft. from dump to bottom. It is 500 ft. from the mouth of the slope to the knuckle. That distance is the most dangerous part of the entire haulage system. Most of the runaways start right at the knuckle after the trip has been hauled to the top, the rear car has been scotched and the cable has been detached so that the front cars can be uncoupled and run to the dump. When this is done the tail end of the trip may hang back over the end of the down grade to the dump and on the steep incline leading back into the mine.

Runaways are usually caused by careless spragging, which allows the trip to coast down into the mine, gaining momentum and the power to do frightful destruction with every turn of the wheels.

It is seldom that any very serious damage is done through the rope breaking or from any other cause when the trip is being pulled up the slope, because when thus being pulled a steel trailer is attached to the rear car and its crows-foot dragging along behind the trip is always ready to stop the train by digging into the ground or ties before any backward momentum is attained. The danger is much greater near the knuckle because it is here that the trailer is removed.

At No. 11 Mine, the trip rider on the rear car of outbound trips takes off his trailer at the mouth of the slope and throws the safety switch. He then waits right there for the next trip of empties going down, and as long as that switch is thrown no runaway cars can run back into the mine.

There are other precautions and safety devices in use at Mine No. 11, such as an automatic engine stop to prevent the hoist from pulling the trip through the tippie, but the "safety switch" is regarded as the most important protection the mine has against damage.

Following the terrific explosion of mine dust at the

Top of No. 11 Slope

Trip rider at switch, detaches trailer and sets safety switch.

Trips Take Sidetrack

The switch on the incline leads the trip up a steep hill slowing down its speed without damage.

Dolomite slope in the autumn of last year, in which more than seventy men lost their lives from a runaway trip which cut an electrical circuit, State Mine Inspector Nesbitt of Alabama had a bill introduced in the Alabama Legislature requiring safety switches at all slope mines, and a further bill providing that lines carrying electric current into mines be concealed. These requirements would tremendously increase the margin of safety in Alabama against a repetition of the Dolomite disaster.
